Preface

The 1973 edition of the *Canada Year Book* continues the series of annual reviews of social, economic and political developments in Canada. The series began in 1905 but earlier editions had appeared under other titles at varying intervals since 1867.

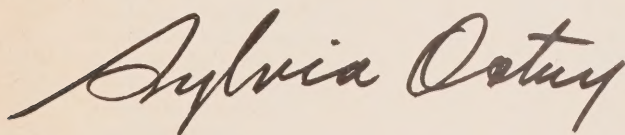

This edition introduces a number of changes in format necessitated by the increasing complexity of subject matter and by the inexorable rise in publishing costs. For example, textual and tabular materials have been separated within each chapter to simplify production. Any problems this might cause in relating text to relevant tables have been minimized by identifying each table both in the appropriate textual location and under its subject heading in the Contents at the front of the book. Another change is the emphasis on the use of charts and graphs in place of pictorial illustrations. Finally, lists of sources in each chapter provide references to additional information on each subject.

Along with the new format there are some changes in content which the reader will find of interest. As it is fifty years since the *Canada Year Book* carried a chapter on Canadian history this seemed an appropriate year to update the earlier article in order to provide a background to the developments recorded elsewhere in the book. Several chapters have been completely revised; for example, the health and welfare chapter has been completely re-written and the former electric power chapter now includes all forms of energy. A new chapter traces the legal system of Canada from its basis in the Constitution, through the court structure to the law enforcement agencies; and the demography chapter combines the former population, vital statistics and immigration chapters. Other chapters have, of course, been brought up to date to reflect changing conditions, including the final chapter on selected economic indicators which summarizes the national accounts.

The popular government organization chart is now presented in a different way. An abbreviated chart appears in Chapter 4 with a list of all departments and agencies, and these organizations are described in detail in Appendix 1 which will be issued separately for use with a detailed chart available from Information Canada. Since certain items, such as diplomatic appointments and sources of official information, are now readily available elsewhere their coverage in the *Canada Year Book* has been discontinued.

As the *Canada Year Book* is an annual reference work the information is that relating to events occurring up to the end of December 1972, unless otherwise stated.

We wish to acknowledge the continued co-operation of the many contributors who so willingly provided information for this issue.

A handwritten signature in dark ink, reading "Sylvia Ostry". The signature is fluid and cursive, with the first name "Sylvia" written in a larger, more prominent script than the last name "Ostry".

Sylvia Ostry
Chief Statistician of Canada
Ottawa, October 1973

Chapter 1

Physiography

1.1 Geography

Canada, occupying the northern half of the North American Continent with the exception of Alaska and Greenland, is the largest country in the Western Hemisphere and the second largest in the world. The lands within its 3,851,809 sq miles of territory are extremely diverse, ranging from the almost semi-tropical areas of the Great Lakes peninsula and the southwest Pacific Coast, wide fertile prairies and great areas of mountains, rocks and lakes to seemingly endless stretches of northern wilderness and arctic tundra. The southernmost point of the country is Middle Island in Lake Erie, at 41° 41'N. In a straight line 2,875 miles northward, past the treeline and far into the Arctic, is Cape Columbia on Ellesmere Island, Canada's northernmost point, at 83° 07'N. From east to west at the widest point, the straight-line distance is 3,223 miles — from Cape Spear, Nfld., at 52° 37'W, to Mount St. Elias, YT, at 141°W.

In position, Canada is situated at the crossroads of contact with the principal powers and some of the most populous areas of the world. In the south, it borders on the United States for a distance of 3,986.8 miles. In the north, the Arctic archipelago penetrates far into the polar basin, making Canada neighbour to northern Europe and the Union of Soviet Socialist Republics. In the east, the salient of Labrador and the island of Newfoundland commands the shortest crossings of the north Atlantic Ocean and links Canada geographically with Britain and France. In the west, the broad arc of land between Vancouver in southern British Columbia and Whitehorse in Yukon Territory provides departure points for crossings of the north Pacific Ocean between continental North America and the Far East. The length of the Yukon - British Columbia border adjoining Alaska is 1,539.8 miles.

In size, Canada's 3,851,809 sq miles may be compared with the area of the USSR at 8,649,539 sq miles, China (including Taiwan) at 3,705,408 sq miles, and Brazil at 3,286,488 sq miles. It is more than 40 times the size of Britain and 18 times the size of France. This immense area, which seems to afford extensive scope for settlement, imposes its own burdens and limitations. Much of the land is mountainous and rocky or is under an arctic climate. The developed portion is probably not more than one third of the total; the occupied farm land is less than 8% and the productive forest land 27% of the total. The population, at approximately 21,569,000 on June 1, 1971, may be compared with 204,800,000 for the United States (1970) and with 95,305,000 for Brazil (1970).

There is no permanent settlement in approximately 89% of the total area of Canada. Only the smallest province, Prince Edward Island, is completely occupied. Large parts of the interior of Nova Scotia, New Brunswick and the Gaspé Peninsula are vacant as is most of the interior of the island of Newfoundland where settlement is confined for the most part to a broken fringe around the coast. On either shore of the St. Lawrence River below Quebec City there is a narrow fringe of settlement, with empty land behind. The continuously settled parts of these maritime areas make up about 1.1% of the area of Canada, and contain 11.7% of its population.

About 57.8% of the population of Canada live in the area between the American border and a 650-mile east-west line from Quebec City to Sault Ste. Marie. Within this area there is continuity of settlement but there are also large unsettled tracts. The block of continuous settlement, whose greatest north-south reach is 270 miles, makes up approximately 2.2% of the area of Canada. The eight largest cities within this block (Montreal, Toronto, Hamilton, Ottawa, London, Windsor, Quebec City, Kitchener) account for 35.8% of the Canadian population.

By far the largest tract of continuous settlement in Canada is in the Prairie Provinces, with a southern margin along the American border of some 900 miles. At its easternmost reach in Manitoba the northern margin of continuous settlement is about 100 miles north of the International Boundary; in the west, the northern margin reaches the 55th parallel, about 400 miles north of the boundary. This settled block occupies about 6.2% of the area of Canada and contains 15.4% of its population. Four cities within the area (Edmonton, Calgary, Winnipeg, Regina) contain 7.3% of the national population. North of this block, the Peace River district, astride the Alberta - British Columbia border, is an agricultural area which reaches the 57th

parallel. This continuously settled area covers about 0.3% of the area of Canada, but contains somewhat less than 0.6% of the country's population.

There is continuity of settlement throughout the southern half of British Columbia, but the continuity is in the form of narrow interconnecting strips following mountain valleys and coastal plains. Between the valleys large areas are empty of permanent settlement. The settled strips occupy about 0.7% of the area of Canada and contain 9.5% of its population. More than 4.0% of the national population is located in the Lower Fraser Valley, principally in the Vancouver metropolitan area.

North of the areas already described there are a number of disjunct settlements, the most notable of which, in regard to size, are in Ontario and Quebec in a band confined by the 47th and 50th parallels. From east to west these are: the Lac St-Jean Lowland some 100 miles north of Quebec City, the Clay Belts astride the Ontario - Quebec border, the Lakehead, and the Dryden and Fort Frances areas in Ontario near the Manitoba boundary. Collectively these blocks of continuous settlement account for about 0.4% of the area of Canada, and approximately 3.6% of its population.

Outside these urban-rural blocks of settlement there are numerous settlements related to mining, forest industries, transportation, administration, defence, hunting, and fishing but with little or no agricultural base. The largest of these isolated settlements, with their 1971 populations, are as follows: Thompson, Man., 19,001; Whitehorse, YT, 11,217; Labrador City and Wabush, Labrador, 11,009; Kenora, Ont., 10,952; Chibougamau, Que., 9,701; Flin Flon, Man. and Sask., 9,344; Fort McMurray, Alta., 6,847; Yellowknife, NWT, 6,122; The Pas, Man., 6,062; Atikokan, Ont., 6,007.

The geographical knowledge of Canada is reasonably complete considering its size and its large areas of difficult access. The whole country has been surveyed and mapped at a scale of 1:250,000, which is very close to four miles to the inch, allowing a detailed depiction of relief, river systems, transportation facilities, forest cover and centres of population. Comparisons of different features and areas can be made, as all map sheets of the series are drawn to the same specifications. In addition, all settled areas and regions of northern development have been mapped at larger scales, in particular at 1:50,000 or approximately one and a quarter inches to the mile, and vertical air photographs showing still more details of the terrain are available for the whole country, varying in scale from about one inch to the mile in the Arctic to four inches, or larger, to the mile in settled areas.

Politically, Canada is divided into ten provinces and two territories. Each province is sovereign in its own sphere and administers its own natural resources and upon such resources, as related to topography, position and climate, is based the economy of the province. The resources (except for game) of the Yukon Territory and Northwest Territories, because of their remoteness, the great extent and the meagre and scattered populations of these areas, are administered by the federal government. The approximate land and freshwater areas of the provinces and territories are given in Table 1.1.

The Canadian Permanent Committee on Geographical Names, administered by the Department of Energy, Mines and Resources, deals with all questions of geographical nomenclature affecting Canada and undertakes research and investigation into the origin and usage of geographical names. The Committee is composed of representatives of the federal mapping agencies and other federal agencies concerned with nomenclature and a representative appointed by each province.

1.1.1 Mountains and other heights

The great Cordilleran mountain system is Canada's most impressive physical feature. Many peaks in the various ranges embodied in the Canadian Cordillera are over 15,000 feet in height, and a total of 576.4 sq miles of territory lies above the 10,000-foot mark. Mount Logan in the St. Elias Mountains of Yukon Territory, which rises 19,850 feet above sea level, is the highest point in Canada.

The highest points in each province are: Newfoundland, 5,232 feet; Prince Edward Island, 465 feet; Nova Scotia, 1,747 feet; New Brunswick, 2,690 feet; Quebec, 5,210 feet; Ontario, 2,275 feet; Manitoba, 2,729 feet; Saskatchewan, 4,567 feet; Alberta, 12,294 feet; British Columbia, 15,300 feet; Yukon Territory, 19,850 feet; and the Northwest Territories, 9,062 feet.

Rossland, BC, is at the highest elevation, 3,465 feet, of any city in Canada and Chilco

Lake, with an area of 75 sq miles, is the highest major lake at 3,842 feet. Heights of the more important Canadian mountains and other elevations are given in Table 1.2.

1.1.2 Inland waters

Every year about 8,000,000 million tons of water fall on Canada in the form of rain and snow. Much of it is evaporated but a large amount drains back to the oceans as surface run-off, forming rivers and lakes along its route. This surface water, ceaselessly moving, is the dominant feature of the Canadian environment. It has been estimated, in fact, that about 7.6% of Canada's total area is covered by fresh water (Table 1.1). There are probably more lakes here than in any other country in the world – so many that they have never been counted. The total area of fresh water is given as 291,571 sq miles but this figure does not include most of the small ponds, non-permanent lakes and sloughs, seasonally flooded areas or large areas of marsh and wet tundra. As much as one seventh of all the fresh, liquid, surface water in the world is contained within Canada's boundaries.

A large portion of this water is contained in the Great Lakes. Slightly more than 37% of their total area is in Canada (Table 1.3). These lakes include some of the largest bodies of fresh water in the world, so large that they have measurable, although very slight, tides.

Other large lakes in Canada, ranging in area from 12,300 to 9,500 sq miles, are Great Bear Lake, Great Slave Lake and Lake Winnipeg. Apart from these, notable for their size, countless smaller lakes are scattered over the major portion of Canada lying within the Canadian Shield. For example, in an area of 6,094 sq miles, accurately mapped, south and east of Lake Winnipeg there are 3,000 lakes; in an area of 5,294 sq miles southwest of Reindeer Lake in Saskatchewan there are 7,500 lakes. The size and elevation of Canada's principal lakes over 150 sq miles in area are listed in Table 1.4.

Lake storage is very valuable – it represents water that can be drawn upon in time of drought to be replaced in time of plenty. Lakes are natural regulators of river flow. But the true measure of a country's water wealth is the amount of water that can be depended upon to be replaced each year – the amount that remains after evaporation has been subtracted from precipitation. This is the amount that flows in its rivers. Here, too, Canada is very fortunate. The combined mean annual flow of all its rivers has been estimated at 3.5 million cu feet per second – about 9% of the total flow of all the rivers of the world. Set against a population of less than 1% of the world total, this constitutes a very generous endowment of fresh water.

It is understandable that Canada's history of settlement and industrial development has been influenced by its great rivers. The country's first industry, the fur trade, flourished because of the ready access to the interior provided by the St. Lawrence River, the Great Lakes and their tributary streams and the many other great and small waterways. Early exploration and settlement depended on this same natural means of access. The plentiful water supplies of the flat and fertile plains of southern Ontario and Quebec attracted an industrious farming people. The river-borne transportation of lumber and later the power of water-driven turbines were vital factors in the building of the country's industrial base. Today, more than ever, water is the key to Canada's development, supplying the renewable energy required for industrial growth, providing easy and relatively cheap transport for bulk raw materials and playing a vital part in the processing of those materials.

Table 1.5 lists the principal rivers of Canada and their tributaries. The tributaries and sub-tributaries are indicated by indentation of names; thus, the Ottawa and other rivers are shown as tributary to the St. Lawrence, and the Gatineau and other rivers as tributary to the Ottawa.

The accompanying map shows the major drainage basins of Canada. Probably the most important is the Atlantic drainage basin, being dominated by the Great Lakes - St. Lawrence system which drains an area of approximately 678,000 sq miles and forms an unequalled navigable inland waterway through a region rich in natural and industrial resources. From the head of Lake Superior to Belle Isle at the entrance of the Gulf of St. Lawrence the distance is 2,280 miles. The entire drainage area to the north of the St. Lawrence and the Great Lakes is occupied by the southern fringe of the Canadian Shield – a rugged, rocky plateau over the edge of which tumble many swift-flowing tributary rivers. These rivers, as well as the St. Lawrence itself, provide the electric power necessary to operate the great industries of the area. South of the St. Lawrence, the smaller rivers are important locally. The Saint John, for instance, drains a fertile area and provides most of New Brunswick's hydro power.

The Hudson Bay drainage basin is the largest in area and its main river is the Nelson. The Winnipeg River, a tributary of the Nelson, is completely developed for hydro-electric power but development of the Nelson itself is just beginning. The two branches of the Saskatchewan River, tributary to the Nelson, drain the great agricultural region of the mid-west and are now the sources of important irrigation projects.

The Arctic drainage basin is dominated by the Mackenzie, one of the world's longest rivers. It flows 2,635 miles from the head of the Finlay River to the Arctic Ocean and drains an area in the three westernmost provinces of approximately 700,000 sq miles. Except for a 16-mile portage in Alberta, barge navigation is possible from Waterways on the Athabasca River to the mouth of the Mackenzie, a distance of 1,700 miles.

The rivers of the Pacific basin rise in the mountains of the Cordilleran Region and flow to the Pacific Ocean over tortuous, precipitous courses, rushing through steep canyons and tumbling over innumerable falls and rapids. They provide power for large hydro-electric developments and in season swarm with salmon returning inland to their spawning grounds. The Fraser River rises in the Rocky Mountains and toward its mouth flows through a rich agricultural area. The Columbia is an international river which has a total fall of 2,650 feet during its course and has thus a tremendous power potential. Although a considerable portion of the United States potential has been developed, Canadian development is relatively slight. The Yukon River is also an international river but, although the largest on the Pacific slope, it is at present relatively unimportant economically.

Utilization of inland water. Over 44% of all water withdrawn in Canada (excluding withdrawals associated with hydro projects) is for one end use, condenser cooling in thermal steam-electric plants. However, about 99% of this water is returned for re-use. Municipal water use, including small industrial processors served by the municipal supply systems of Canada, accounts for some 10% of current daily water withdrawals. On average, approximately 75% of the water pumped into the system is discharged as storm and sanitary sewage containing waste materials.

Other industrial users, manufacturing and mining firms, account for 38% of the total withdrawals of water in Canada and about 10% of that intake is consumed or lost. Discharged water is usually returned to source in a highly polluted condition and may be unfit for most uses downstream. Agriculture requires 8.5% of the nation's total withdrawals annually for irrigation, stockwatering and rural domestic use and most of this water is consumed and not returned to the water supply source.

Hydro-electric power generation utilizes the kinetic energy of falling water to produce energy. Except for evaporation losses from the surface of reservoirs, the water is not consumed or changed in any way. However, serious adverse effects may occur through flooding of land through storage and interference with natural flow up- and down-stream.

1.1.3 Coastal waters

The coastline of Canada, measuring over 150,000 miles, is one of the longest of any country in the world; it comprises the following estimated mileages (statute). Mainland: Atlantic, 9,965; Pacific, 4,363; Hudson Strait, 2,671; Hudson Bay, 6,233; Arctic, 11,884; other, 1,240; total, 36,356 miles. Islands: Atlantic, 18,176; Pacific, 11,620; Hudson Strait, 8,318; Hudson Bay, 6,956; Arctic, 57,016; other, 13,047; total, 115,133 miles.

A comprehensive description of the coastal waters of Canada would require information from sciences such as oceanography, marine biology and meteorology. However, the basic factor in any study of the oceanic-continental margin is the physical relief of the sea floor, and the scope of the information presented here is therefore restricted to this and a few salient features of the Atlantic, Pacific and Arctic marginal seas surrounding Canada.

Atlantic. Along this coastal area, the sea has inundated valleys and lower parts of the Appalachian Mountains as well as those of the Canadian Shield. The submerged continental shelf, protruding seaward from the shore, effects the transition from continental to oceanic conditions. This shelf is distinguished by great width and diversity of relief. From the coast of Nova Scotia its width varies from 60 to 100 miles, from Newfoundland 50 to 120 miles (at the entrance of Hudson Strait), and northward it merges with that of the Arctic Ocean. The outer edge of the shelf, known as the continental shoulder, varies in depth from 100 to 200 fathoms before the shelf suddenly gives way to the steep declivity leading to abyssal depths. The over-all gradient of the Atlantic continental shelf is slight but the whole area is studded with shoals, plateaus, banks, ridges and islands and the coasts of Nova Scotia and Newfoundland are rugged and fringed with islets and shoals. Off Nova Scotia, the 40-fathom line lies at an average of 12 miles from the shore and constitutes the danger line for coastal shipping. The whole floor of the marginal sea appears to be traversed by channels and gullies cutting well into the shelf.

The main topographical features of the Atlantic marginal sea floor are attributed to glacial origin but land erosion is an important factor. Eroded materials are carried seaward by rivers, ice and wind, and wave action against cliffs and shore banks washes away enormous masses that are deposited over the surrounding sea floor. The topography of the continental sea floor is therefore constantly changing and navigation charts of Canada's eastern seaboard must be continuously revised.

Hudson Bay and Hudson Strait bite deeply into the continent. Hudson Bay is an inland sea 317,501 sq miles in area having an average depth of about 70 fathoms; the greatest charted depth in the centre of the Bay is 141 fathoms. Hudson Strait separates Baffin Island from the continental coast and connects Hudson Bay with the Atlantic Ocean. It is 430 miles long and from 37 to 120 miles wide and its greatest charted depth of 481 fathoms is close inside the Atlantic entrance. Great irregularities of the sea floor are indicated but, except in inshore waters, few navigational hazards have been located.

Pacific. The marginal sea of the Pacific differs strikingly from the other marine zones of Canada. The hydrography of British Columbia is characterized by bold, abrupt relief — a repetition of the mountainous landscape. Numerous inlets penetrate the mountainous coasts for distances of 50 to 75 miles. They are usually a mile or two in width and of considerable depth, with steep canyon-like sides. From the islet-strewn coast, the continental shelf extends from 50 to 100 sea miles to its oceanward limit where depths of about 200 fathoms are found. There the sea floor drops rapidly to the Pacific deeps, parts of the western slopes of Vancouver Island and the Queen Charlotte Islands lying only four miles and one mile, respectively, from the edge of the declivity. These great detached land masses are the dominant features of the

Pacific marginal sea. As is to be expected in a region so irregular in hydrographic relief, shoals and pinnacle rocks are numerous, necessitating cautious navigation.

Arctic. The submerged plateau extending from the northern coast of North America is a major part of the great continental shelf surrounding the Arctic Ocean, on which lie all the Arctic islands of Canada, Greenland, and most of the Arctic islands of Europe and Asia. This shelf is most uniformly developed north of Siberia, where it is about 500 miles wide; north of North America it surrounds the western islands of the archipelago and extends 50 to 300 miles seaward from the outermost islands.

The floor of the submerged part of this continental margin is nearly flat to gently undulating, with here and there isolated rises or hollows. Most of it has an average slope seaward of about one half a degree, with an abrupt break at the outer edge to the continental slope whose declivity is commonly six degrees or more. From the Alaskan border eastward to the mouth of the Mackenzie River the shelf is shallow and continuous with the coastal plain on the mainland; the outer edge of the shelf, or continental shoulder, lies at a depth of about 35 fathoms and about 40 nautical miles off shore. This shelf is continuous with that north of Alaska and Siberia. Near the western edge of the Mackenzie River delta, the continental shelf is indented by a deep valley (the so-called Herschel Sea Canyon) whose head comes within 15 miles of the coast. Between Herschel Sea Canyon and Amundsen Gulf, the typical features of the continental shelf are replaced by the submerged portion of the Mackenzie River delta, which forms a great pock-marked undersea plain, most of it less than 30 fathoms deep, up to 75 nautical miles wide and 250 miles long.

North and east of the submerged portion of Mackenzie River delta, the continental shelf, while typical in form, is more deeply submerged than that off the mainland and Alaska. Its gently undulating surface is, for the most part, 200 fathoms or more below sea level, and the well-defined, nearly straight continental shoulder is for the most part over 300 fathoms deep, giving way to the smooth continental slope which extends without significant interruption to the floor of the abyssal Canada Basin at a depth of about 2,000 fathoms. The deeply submerged continental shelf extends along the entire west coast of the Canadian Arctic archipelago from Banks Island to Greenland. All of the major channels between the islands — Amundsen Gulf, M'Clure Strait, Prince Gustav Adolf Sea, Peary Channel, Sverdrup Channel and Nansen Sound — have flattish floors at about the same depth as the shelf and appear to enter it "at grade", although there are a few local irregularities that may be the result of glacial action. No deep indentations or canyons are known to cut the continental slope or continental shelf off the archipelago, except one sinuous canyon that heads off Robeson Channel at the northeastern end, close to the coast of Greenland. The submerged sides of the channels of the archipelago, and the slopes from the shoreline at the western edge of the islands to the inner edge of the deeply submerged shelf, are in many places marked by a series of steps or terraces.

The continental shelf bordering the Arctic Ocean as well as the adjacent mainland, particularly near the delta of the Mackenzie River, and the islands of the archipelago have been subjected to increasingly intensive scientific study and mineral resource exploration during the past 15 years. Co-ordinated and continuing programs of research and surveys have studied the bedrock geology, the development of the terrain, the sediments on the sea floor and the nature and history of the ice caps. Gravity, seismic, aeromagnetic, geomagnetic and geothermal investigations have obtained information on the physical characteristics and structure of the rocks beneath the surface, and the nature and stability of the crust underlying the islands, the continental shelf and the continental slope. A complementary program of geodetic, topographic and hydrographic surveys has provided the necessary background maps and charts, and information about both terrestrial and marine physiography for these studies. Along with the technical surveys and investigations in the physical sciences, there have been less intensive but very relevant studies of the biology of the Arctic lands and oceans. The result of all these activities is that a great deal of reliable scientific information in a wide range of subjects is now available for an area about which very little was known two decades ago.

1.1.4 Islands

The largest islands of Canada are in the North and all experience an arctic climate. The northern group extends from the islands in James Bay to Ellesmere Island which reaches 83° 07'N. Those in the District of Franklin lie north of the mainland of Canada and are generally

referred to as the Canadian Arctic archipelago; those in the extreme north — lying north of the M'Clure Strait - Viscount Melville Sound - Barrow Strait - Lancaster Sound water passage — are known as the Queen Elizabeth Islands.

On the west coast, Vancouver Island and the Queen Charlotte Islands are the largest and the most important but the coastal waters are studded with many small rocky islands.

The island of Newfoundland forming part of the province of Newfoundland, the province of Prince Edward Island, Cape Breton Island forming part of the province of Nova Scotia, Grand Manan and Campobello Islands forming part of the province of New Brunswick, and Anticosti Island and the Magdalen group included in the province of Quebec are the largest islands off the east coast.

Notable islands of the inland waters include Manitoulin Island (1,068 sq miles in area) lying in Lake Huron, the so-called Thirty Thousand Islands of Georgian Bay and the Thousand Islands in the outlet from Lake Ontario into the St. Lawrence River.

The areas of principal islands by region are given in Table 1.6.

1.1.5 Surveying and mapping

The needs for maps and surveys of Canada are met mainly by the Department of Energy, Mines and Resources. Although not all branches of this Department make surveys and compile maps, many of them are involved in such work either wholly or partly. They compile topographical, geological and aeromagnetic maps, aeronautical charts and specialized maps showing electoral district boundaries, land use and other features. In carrying out these tasks, the Department is guided partly by long-range plans based on general national needs and partly by requests from other government agencies and private enterprise. Some types of maps and surveys are also produced by provincial and private agencies and, to avoid duplication, the Department co-ordinates its work with these bodies. Other types — such as aeronautical charts — are produced exclusively by the Department. Of the various branches, the following are particularly concerned with surveying and mapping: Surveys and Mapping Branch (geodetic and topographic surveys, legal surveys of Canada lands, geographical atlases, electoral maps and aeronautical charts); Geological Survey of Canada (geological features); and Earth Physics Branch (geophysical maps).

Types of surveys. In the field of geodesy, the Geodetic Survey maintains a network of horizontal and vertical control points across Canada. Much of its present activity is centred on achieving greater density of control and closing gaps in southern Canada. The ultimate goal is the establishment of at least one horizontal and vertical control point within ten miles of any point in established and economically important areas.

The Topographical Survey is proceeding with the compilation of topographical maps. The mapping of Canada at the scale of four miles to one inch is complete; this series will be revised and updated from time to time. On the scale of one mile to one and a quarter inches, 5,000 map sheets are available of a planned 13,150. Sheets published to date cover most of the settled areas of Canada and certain wilderness areas of interest because of resources or defence requirements. On the relatively large scale of one mile to two and a half inches, 800 maps are available, covering all major cities and their suburbs. Wide acceptance has been found for photomaps, a relatively new map-type made possible by advances in air photography and photogrammetry.

The Legal Surveys Division is responsible for the technical management of legal surveys of land under federal jurisdiction, such as the northern Territories, national parks and Indian reserves. It also executes such surveys on behalf of administering departments, collaborates in the demarcation of provincial boundaries, prepares descriptions of electoral districts and generally provides land-surveying services to other departments.

The Surveys and Mapping Branch is the major agency in Canada for the preparation of aeronautical charts showing airports, airways and radio and other aids necessary for air navigation. As a service to map-makers, prospectors, engineers, foresters, town planners and others interested in that field, the Department maintains a National Air Photo Library in Ottawa containing a collection of all air photographs taken by or for the federal government — about 4 million black-and-white and colour prints. During the course of a year, the Library may receive requests for more than 1 million copies of such prints. The Library is also responsible for the storage, documentation and handling of airborne remote sensing

photography and Earth Resources Technology Satellite imagery. Photographs can be ordered through the Library in Ottawa or at the Geological Survey's Institute of Sedimentary and Petroleum Geology in Calgary.

Geological surveys provide an inventory of the potential resources of Canada, aid in the discovery of mineral deposits, and assist in other aspects of the national economy influenced by geological factors. Each year, over 100 parties are placed in the field. Large reconnaissance projects are mounted in the northern regions of the country, and more detailed investigations in the better-known southern areas. Geological maps are published either separately or, more commonly, as part of scientific papers.

Both the Geological Survey and the Earth Physics Branch carry out geophysical surveys, resulting in maps showing such features as variations in terrestrial magnetism, gravity and seismology. The geophysicists of the Geological Survey are interested mainly in outlining local magnetic variations indicative of mineral deposits, while those of the Earth Physics Branch map the earth's total magnetic field. The Earth Physics Branch operates 23 first-order and six second-order seismic observatories throughout Canada, whose records are used in compiling and updating an earthquake zoning map of Canada of interest to architects and engineers. A gravity map of Canada is also being published and updated.

In the drafting and printing of the maps, highly advanced techniques for the automatic transfer of terrain features from air photos to drafting sheets and precise lithographing are combined to assure speedy processing of field data and the production of colourful, easily understood and relatively inexpensive maps for every type of user, from vacationer to town planner and from prospector to pilot. In the fall of 1972, the first map using the automated cartography system developed by the Surveys and Mapping Branch was produced. This system allows maps to be drawn directly from a computerized data base rather than through the use of draftsmen. The Department operates a large modern plant to print maps and charts compiled by its several branches and by other government departments and agencies. The Surveys and Mapping Branch has a stock of 22.6 million maps from which it distributes about 4 million annually.

1.2 Geology

Canada is composed of some 17 geological provinces that may be grouped under four main categories — continental shelf, platform, orogen and shield. The geologically youngest provinces, the Atlantic, Pacific and Arctic Continental Shelves are made up of little deformed sediments and volcanics, mainly of Mesozoic and Cenozoic age, which have accumulated and are still accumulating along the margins of the present continental mass. The St. Lawrence, Interior, Arctic and Hudson Platforms are formed of thick flat-lying Phanerozoic strata which cover large parts of the crystalline basement rocks of the continental interior, the extension of the Canadian Shield. The Appalachian, Cordilleran and Innuitian Orogens are mountain belts of deformed and metamorphosed sedimentary and volcanic rocks mainly of Phanerozoic and Proterozoic age, intruded by granitic plutons. They were produced during the various Phanerozoic orogenies 50 to 500 million years ago. Of the seven provinces comprising the Precambrian Canadian Shield, the Grenville, Churchill, Southern and Bear embrace the orogenic belts that were produced during the Proterozoic orogenies, 900 to 1,800 million years ago. The remaining three, the Superior, Slave and Nutak Provinces, were deformed during the Archean Eon, and include the oldest continental crust known in Canada, 2,500 to 3,000 million years old. The Precambrian orogenic belts have many features in common with those of Phanerozoic age but are so deeply eroded that the mountainous parts have been reduced to plains or lowlands and in many places the basement crystalline rocks upon which the sediments and volcanics initially accumulated are now exposed.

The land and freshwater area of Canada is 3,852,000 sq miles, but unique among the nations of the world, Canada also includes within this area some 858,000 sq miles of marine waters. The rocks beneath have geological features akin to the adjacent regions on-shore. In addition, the submarine area of the bordering continental shelves is about 523,000 sq miles and of the continental slopes, 563,000 sq miles. In common with other maritime nations, Canada exercises sovereign rights over all these adjacent regions under the sea for the purpose of exploring and exploiting their natural resources, and so, within the confines of the continental slopes, Canada embraces 5,526,000 sq miles (15,000,000 sq km), about 3% of the surface of the globe.

The mineral industry is one of the more important sectors of the Canadian economy. The value of mineral production in 1972 was \$6,341 million, of which metals represented 46%, fuels 37%, and industrial minerals 17%. Much was exported, mainly to the United States, Britain and Japan. Principal minerals were oil, natural gas, nickel, copper, iron ore, zinc, asbestos, cement, and sand and gravel. Other important products were lead, gold, silver, potash, sulphur, molybdenum, coal, uranium, salt, titanium, platinum and gypsum. Of the major geological regions, the Interior Platform yields, in value, about 39% of all mineral production, mainly fuels, and the Canadian Shield about 36%, mainly metals. Cordilleran Orogen accounts for 12%, Appalachian Orogen 8% and St. Lawrence Platform 5%.

1.2.1 Continental shelves

The youngest, or geologically newest, provinces are the continental shelves which, with the continental slopes and the coastal plains, form broad sedimentary prisms, the outer margins of which lie at the transition from continental to oceanic crust. They transect several older geological provinces at sharp angles, or lie subparallel with bordering and underlying orogenic belts. The shelf deposits are mainly Mesozoic and Cenozoic clastics, partly deltaic, with some Paleozoic and Proterozoic rocks. Current exploration is for oil and gas.

1.2.2 Platforms

The platformal regions are underlain by nearly flat-lying Phanerozoic strata that lie unconformably upon peneplaned Precambrian crystalline rocks. They are warped into basins, embayments and arches which reflect gentle differential subsidence or uplift and tilting of the crust; some faulting may have produced graben.

The St. Lawrence Platform is underlain by thin sandstone, carbonate, evaporite and shale, Cambrian to Devonian in age. The platform includes the southwest-plunging Algonquin Arch, remnants of several basins, and the cover on the Grenvillian deformed basement of Great Northern Inlier. The strata yield salt, gypsum, oil and gas, and structural and building materials, the latter partly from glacial deposits. Columbium is mined from one of the Cretaceous, Montegregian alkaline plugs that intrudes a basement inlier.

The Interior Platform contains several superimposed, unconformity-bounded sequences of Phanerozoic strata, the present structural features having little in common with those of earlier periods. The platform basement consists of Precambrian crystalline rocks bearing Kenoran and Hudsonian isotopic ages and, in the north, little deformed Helikian and Hadrynian platformal sediments.

Thick cycles of Cambrian carbonate and shale in Lloydminster Embayment grade eastward into sandstone. Ordovician and Silurian carbonate, shale and anhydrite form a thick, uniform plate in the northwest and the initial deposits of the weakly depressed Williston Basin. In Manitoba, the Ordovician Tyndall building stone and Silurian gypsum are utilized.

Middle Devonian evaporites, carbonates and clastics form Elk Point Basin, a broad, deep embayment bounded on the west by Alberta Arch. Potash salts are recovered by mining, and halite as a brine. Islands of Precambrian along Tathlina Arch were surrounded by carbonate banks and reefs, some now yielding oil and gas. One dolomitized reef above the continuation of the McDonald basement fault hosts the Pine Point lead-zinc orebody. Upper Devonian cyclical sequences of anhydrite, dolomite and siltstone grade into the massive carbonate banks and isolated reefs of central Alberta. These carbonates contain half the oil and a quarter of the gas reserves of the Interior Platform. The shales between the reefs intertongue northward with siltstone and sandstone, partly non-marine, derived from the Devonian Ellesmerian mountains bordering the Arctic Ocean. During the Mississippian, carbonate, anhydrite, and fine clastics reflect a regional, progressive, rhythmically interrupted, westward regression of the seas. These rocks have a tenth of the oil reserves and a fifth of the gas.

The late Paleozoic and early Mesozoic were mainly times of erosion. Some Pennsylvanian and Permian red beds, evaporites and chert occur. Triassic carbonates, evaporites, and easterly-derived clastics lie along the southwestern border. In Williston Basin are Jurassic siltstone, shale, anhydrite and carbonate.

During the Early Cretaceous there was a rapid marine incursion from the Arctic Ocean over the bevelled, west-dipping Paleozoic strata. Periodic uplifts, associated with phases of the Jura-Cretaceous Columbian Orogeny and the Tertiary Laramide Orogeny, produced the vast quantities of sandstone and shale that form Rocky Mountain Exogeosyncline. The marine

beach and deltaic sandstones hold reserves of about one third the marketable gas and a quarter of the oil. The Lower Cretaceous also contains the Athabasca oil sands with reserves of 266,000 million barrels of recoverable upgraded oil. Coal deposits are lignite to high volatile subbituminous in rank.

The Arctic Platform. Thick Paleozoic carbonates and basal clastics constitute most of the Arctic Platform. They are divided into several basins and embayments by arches and uplifts of Precambrian basement, toward which the strata generally thin and converge. The core of Boothia Uplift is formed of fault-bounded Precambrian crystalline rocks, uplifted and exposed during the Devonian. The derived clastics were trapped in adjacent basins, and the bordering Lower Paleozoic strata deformed to form Cornwallis Fold Belt.

The Hudson Platform includes the Phanerozoic rocks in the basins and graben underlying and adjoining Hudson Bay and Hudson Strait. Ordovician to Devonian carbonate, gypsum, shale and marginal sandstones have lithological and faunal affinities with the three other platformal regions. Moose River Basin, which contains Lower Cretaceous clastics and lignite, is bounded on the south by a basement uplift that was active during the Devonian.

1.2.3 Phanerozoic orogens

The Appalachian Orogen consists of a fold belt of late Precambrian and early Paleozoic strata that were deformed in the Hadrynian Avalonian, Ordovician Taconian and Devonian Acadian Orogenies, and the Fundy Epieugeosyncline of late Paleozoic strata involved in the Maritime Disturbance.

The Appalachian Geosyncline developed on the southeast flank of the Grenvillian Orogen with the deposition of thick, Hadrynian clastic and volcanic rocks. During the early Paleozoic, clastics, turbidite breccias, thick volcanics and ultrabasic intrusions accumulated, bordered on the northwest and southeast by thin carbonate and shale sequences. Deformation was mainly northwesterly thrusting and close folding; some older rocks were deformed several times. Parts were metamorphosed and intruded by granitic stocks and batholiths. Asbestos, copper, zinc, silver and lead are produced.

Late Paleozoic non-marine sandstones and shales were deposited in the intermontane basins of the Fundy Epieugeosyncline and derived from intervening, fault-bounded uplands. Subsidence of the basins generally occurred contemporaneously with uplifting and faulting. Some marine deposits are limestone, gypsum and salt which are all mined, and are also the host rocks of a barite deposit beneath which is a lead-zinc-copper-silver sulphide orebody. The non-marine beds have yielded high volatile bituminous coal for nearly 200 years. Upper Triassic red beds and basalt underlie the Bay of Fundy. During the Mesozoic and Cenozoic, the Appalachian Orogen was undergoing erosion, the products being deposited on the Atlantic Continental Shelf.

The Cordilleran Orogen of Canada is part of the circum-Pacific orogenic belt. The eastern part underwent superficial deformation in the Jura-Cretaceous Columbian and Tertiary Laramide Orogenies. Natural gas, oil and coal are produced. More westerly parts suffered multiple deformation, metamorphism and plutonism, these regions yielding lead, zinc, silver and copper, most of the molybdenum, antimony, bismuth, cadmium and tungsten produced in Canada, and all the tin and mercury. Also mined are asbestos, coal, gold, nickel, iron and barite.

The Cordilleran Geosyncline was initiated in the early Helikian with the deposition of very thick, shallow-water carbonates, sandstones and shales, host to the Sullivan lead-zinc orebody (1,340 million years) which has yielded about half of the mineral wealth of British Columbia. The Helikian strata were gently folded, metamorphosed and intruded by granite. The unconformably overlying Hadrynian consists of thick slate, grit and conglomerate, partly of glacial origin, and chert-hematite iron-formation.

The Cambrian to Devonian sequences are composed of sandstones and carbonates which grade westward into a widespread shale facies and thence, into chert, argillite, sandstone and volcanics with ultrabasic bodies. The metacarbonates, mainly Cambrian, of the Omineca Crystalline Belt and the Selwyn Fold Belt, host lead, zinc, silver and tungsten deposits.

The Mississippian lies unconformably on older rocks deformed in the Devonian Caribooan and Ellesmerian Orogenies, but near the craton rest conformably on the Devonian.

The carbonates are reservoirs for oil and gas. Much sulphur is recovered in processing the gas. The Mississippian, Pennsylvanian and Permian contain sandstone, limestone, chert and phosphatic sediments and in the west, basic volcanics, black shale, volcanic arenite, limestone, chert, and many ultrabasic bodies which lie close to the major faults.

During the early Mesozoic, depositional conditions comparable to those of the late Paleozoic prevailed, but later, as the effects of the various orogenies amassed, deposition ceased and mountain belts formed. The Triassic is represented by thick argillite, chert, volcanics, some red beds near local uplifts, and a widespread limestone. The Jurassic includes coarse polymictic conglomerate, turbidite, and volcanics, deposition being interrupted in the Columbia Intermontane Belt by the Inklinian and Nassian Orogenies. Porphyry copper and molybdenum deposits occur in brecciated Inklinian intrusions; other copper deposits occur in the basic volcanics, some carrying zinc and gold. The Nassian Orogeny segmented the Columbia Intermontane Belt into three basins which were gradually filled with detritus, the northern two becoming landlocked. These basins yield Jura-Cretaceous coal. Nassian Orogeny also affected the Insular Fold Belt; intrusions on Vancouver Island produced magnetite-bearing skarns in the Triassic limestones.

Most of the Cordilleran Geosyncline was deformed during the Jura-Cretaceous Columbian Orogeny. Clastics derived from the mountains were deposited on Pacific and Arctic Continental Shelves, in the intermontane basins and foredeeps, and ultimately, as the craton was regionally depressed, in Rocky Mountain Exogeosyncline. Most deformation ended with the Laramide Orogeny. In eastern Rocky Mountain Thrust Belt, the folds and thrusts trap Mississippian oil and gas and repeat Jura-Cretaceous coal seams. Fluvial and lacustrine clastics fill some linear fault-bounded intermontane valleys and trenches. Mercury deposits are associated with some of the faults. Much of the Columbia Intermontane Belt was covered by widespread flood basalts and several younger volcanoes and cinder cones but generally, conditions of erosion prevailed into glacial times. In unglaciated areas, and in deep valleys, the Klondike and Cariboo gold placers were preserved.

The Innuitian Orogen. During the early Paleozoic, Franklinian Geosyncline extended from eastern Greenland along the northern margin of the continent into Alaska. In the Arctic Islands, it was initiated in the late Precambrian, underwent minor deformation during the Cambrian and Early Devonian, but was severely deformed only in the Devonian-Mississippian Ellesmerian Orogeny. Superimposed upon the deformed belt is Sverdrup Basin which contains a thick, concordant succession, late Paleozoic to Tertiary in age, that was deformed by the Tertiary Eurekan Orogeny in the northeast and by evaporite diapirism in the southwest.

The Hadrynian and Cambrian consist of dolomite, shale, quartzite and some meta-sedimentary and meta-volcanic rocks. Thick Ordovician to Devonian carbonate sequences are partly reefy or interbedded with anhydrite and grade abruptly northward into graptolitic shale. Clastics and volcanics bordering the Arctic Ocean are metamorphosed and intruded by granite during Ellesmerian Orogeny.

In Sverdrup Basin, Pennsylvanian and Permian sandstone grade northwestward into limestone, shale, biohermal reefs, and anhydrite, the source for the evaporite diapirs. The Mesozoic is characterized by intertonguing shales and sandstones, partly non-marine, which are derived from the south, east and northwest. Recent drilling has encountered gas and oil. In Prince Patrick Uplift, the strata are broken by north-trending Jurassic and Tertiary normal faults.

1.2.4 Canadian Shield

The Precambrian rocks of the Canadian Shield are grouped into provinces and sub-provinces on the basis of stratigraphic relationships, structural and metamorphic features produced by major orogenies, and concentrations of isotopic ages from plutonic rocks. The orogenies and isotopic ages also provide the framework for a time-classification for the Precambrian — the Kenoran Orogeny, with a mean age of 2,480 million years, occurring at the end of the Archean Eon, and the Hudsonian and Grenvillian Orogenies with mean ages of 1,735 and 955 million years, respectively, at the end of the Aphebian and Helikian Eras. These latter, together with the Hadrynian Era, constitute the Proterozoic Eon. The Elsonian plutonic event, with a mean age of 1,390 million years, serves to divide the Helikian into the Paleohelikian and Neohelikian Sub-eras. The limits of the provinces do not correspond with those of the old orogenic belt, e.g., the Archean rocks of Kenoran Orogen extend beyond Superior Province into Grenville and Churchill Provinces. Furthermore, many of the orogenic belts of the Shield are largely denuded of the supracrustal rocks that were laid down in the depositional interval preceding the major orogeny. Large parts are composed of rocks that formed the basement upon which the sequences were deposited and which reflect the deformation that occurred deep within the crust beneath the mountain belt, now entirely destroyed by erosion.

Grenville Province is a linear orogenic belt that transects several other structural provinces of the Shield and extends beneath Appalachian Orogen, possibly to the continental border. Archean rocks, separated from those of the Superior Province by a metamorphic front, are massive granites and gneisses derived from volcanic and sedimentary rocks. The Aphebian is represented by paragneiss and schist with remnants of quartzite, marble, and iron-formation, the latter containing the magnetite and specularite orebodies at Wabush Lake and Lac Jeannine.

The Paleohelikian includes thick marble, quartzite, and paragneiss with minor volcanics. The Elsonian intrusions, accompanied by high-grade metamorphism, are layered anorthosite with border phases of mangerite. The intrusions contain bands of ilmenite-hematite and titaniferous magnetite which are mined at Lac Tio and St. Urbain. Neohelikian rocks occur as paragneiss and schist remnants and as a thick sequence of red clastics, limestone, basalt and diabase sills in Naskapi Fold Belt. Related to the Grenvillian Orogeny are quartz monzonite, syenite and nepheline syenite bodies, northeast-trending folds, and moderate- to high-grade metamorphism. Small, unconformable remnants of Hadrynian arkose occur.

Southern Province. Only disconnected parts of Southern Province lie in Canada. Within the Penokean Fold Belt the early Aphebian Huronian succession embraces four unconformity-bounded groups, each composed of a basal conglomerate, possibly tillite, overlain by argillite, quartzite, and limestone. Some conglomerates at Blind River are rich in uraninite, and constitute most of the uranium reserves. The Huronian is intruded by the Nipissing diabase (2,150 million years). The uppermost group overlaps northward onto the

Archean and forms the gently warped Cobalt Embayment, host for silver and cobalt veins. The Huronian was folded, metamorphosed and intruded by granitic plutons (1,750 to 2,140 million years) and by the Sudbury Irruptive (1,720 million years) which contains nickel, copper, gold, silver, cobalt and the rare platinum group metals. In Port Arthur Homocline, the Animikean rocks, probably Mid-Apheblian, form a thin southerly dipping succession of conglomerate, cherty iron-formation and black slate. In Lake Superior Basin and Nipigon Embayment are thin Helikian red arenites, the unconformably overlying Keweenawan basalt (1,100 million years), and gabbro sills and sheets.

Bear Province is composed of Hudsonian deformed Apheblian rocks, the Wopmay Orogen, and a thick Helikian cover, the Coppermine Homocline. The northeastern-most Apheblian sediments are pierced by uplifts of Archean basement. To the west lies a narrow fold and thrust belt of quartzite, shale, stromatolitic dolomite and diabase sills which grade westward into fine clastics and red beds. Farther west is a broad belt of gneiss, migmatite and granite; part may be Archean. Late Apheblian basins contain red beds and porphyritic volcanics cut by veins containing radium, silver, cobalt, and uranium at Eldorado. Coppermine Homocline contains gently warped quartzite and stromatolitic dolomite cut by diabase dyke swarms (1,200 million years) and by the Muskox ultramafic body. Unconformably overlying are thin clastics and dolomite, the thick Neohelikian Coppermine basalts, and Hadrynian clastics, dolomite, and gypsum with diabase sills (650 million years).

Churchill Province embraces nearly half the Canadian Shield. It is composed of several geosynclinal belts of Apheblian rocks that were deformed in the Hudsonian Orogeny, large tracts of Archean rocks that were redeformed, remetamorphosed and remobilized during the orogeny, and remnants of post-orogenic Helikian cover rocks.

The Archean rocks are vaguely aligned in east-west trending belts and exhibit at least two directions of folding. In the Flin Flon and Ennadai Belts are typical thick sequences of volcanic rocks and related sediments. The volcanics of Flin Flon Belt host massive sulphide orebodies of copper, zinc, lead, silver and gold. Paragneiss characterizes the Lynn Lake Belt in which gabbro intrusions carry copper-nickel deposits, and also the Tazin Belt which contains much calc-silicate gneiss and quartzite.

Some Apheblian rocks are partly undeformed and border Superior and Slave Provinces; others form northeast-trending gneiss belts in the interior. During the Apheblian, the Archean rocks of Superior, Slave and Nutak Provinces formed stable cratonic blocks, their bordering geosynclines joining those in Bear, Southern and Grenville Provinces.

In the Labrador Fold Belt the Apheblian is represented by fine clastics, dolomite and iron-formation, leached to form the large Schefferville iron orebodies. The strata are repeated by closely spaced east-dipping thrusts and concentric folds. To the east and in the Cape Smith Fold Belt are broadly folded and thrustured basic volcanics interbedded with schist and intruded by gabbro and peridotite sills. Further east and north are Apheblian and Archean gneisses and granites. Bordering Nutak Province are mylonite zones and the Elsonian anorthositic intrusions. On Baffin Island the high grade gneisses include an exceptionally pure iron orebody that occurs in iron-formation that was metamorphosed, enriched and remetamorphosed. In the Belcher Fold Belt, the Apheblian forms huge, broad folds and consists of clastics, dolomite, iron-formation, basalt and gabbro sills. The Thompson Belt includes a narrow zone of faulted Apheblian gneisses intruded by peridotite pods bearing nickel sulphide orebodies and separates the strikingly different Archean blocks of the Pikwitonei Belt, Superior Province and the Flin Flon and Lynn Lake Belts of Churchill Province.

Within western Churchill Province are *en échelon* belts of northeast-trending Apheblian rocks some of which lie unconformably on Archean basement. Intervening and adjacent plutonic belts are very extensive and are probably partly Archean. Bordering East Arm Fold Belt, a remnant of the geosyncline on the east side of Slave Province, is McDonald fault system. This is a zone of dextral transcurrent faults that extends southwestward beneath Interior Platform to the Cordilleran Orogen. Paleohelikian conglomerates derived from associated uplifts were deposited unconformably on the Apheblian rocks of East Arm Fold Belt. Several other fault systems also cross western Churchill Province with displacements occurring at various times; some are associated with diabase dyke intrusions. The multiple-aged uraninite and pitchblende deposits of the Beaverlodge camp are associated with a northeast-trending sinistral fault system transecting Tazin Belt. The Paleohelikian is

represented by red beds with basalt or felsic porphyry that occur in fault founded graben in the Tazin Belt and the Thelon Plate, or by thick easterly derived sandstone forming the Athabasca and Thelon Basins.

Nutak Province, formerly termed eastern Nain Province, is a narrow belt of northeast-trending Archean granodioritic gneiss and migmatite unconformably overlain by flat-lying Proterozoic sediments and volcanics.

Slave Province. The Archean consists of basalt and andesite flows with over-lying, or equivalent, greywacke, shale and conglomerate resting in places on an older basement. During Kenoran Orogeny (2,460 million years) these rocks were folded, intruded by granodiorite and quartz monzonite plutons and pegmatite dykes, and metamorphosed. Shear zones, with gold-bearing ore shoots at Yellowknife, cut the volcanic rocks and are possibly related to a younger episode of folding. Aphebian and Helikian events include intrusion of diabase dyke swarms and faulting.

Superior Province. The Archean rocks of Superior Province fall into several belts or segments with common tectonic and lithological features — dominantly sedimentary, volcanic or plutonic, that may reflect not only the relative ages of the rocks but also the general distribution of the Archean geosynclinal and orogenic belts.

The dominantly sedimentary regime is represented by the English River and Quetico Belts of easterly trending paragneiss and by their extensions into central Quebec. Where least metamorphosed the sediments are greywacke and shale, impure quartzite and arkose with minor volcanic rocks, mainly basalt. The youngest rocks occur in synclinoria and include iron-formation and conglomerates, some with clasts of granite and gneiss.

Thick volcanic assemblages form the typical Archean “greenstones” dominating Abitibi, Wawa, Wabigoon, Uchi and Sachigo Belts. They are mainly basalt and andesite but include much pyroclastic material of intermediate and acidic composition, sills and masses of gabbro, diorite and peridotite, rare anorthosite, and beds of greywacke, argillite, conglomerate, and iron-formation, the latter mined at Steep Rock, Michipicoten, Timagami and Kirkland Lake. The volcanics, near the Cadillac and Porcupine-Destor faults, host the polymetallic sulphide orebodies of the Noranda, Timmins, Kirkland Lake and Metagami camps that yield the greater part of the copper, zinc, gold and silver obtained from the Shield. The strata are intruded by granitic stocks and batholiths, and folded several times, but the metamorphism is generally low grade.

The plutonic regions, such as the Ungava, Wawa and Berens Belts, are characterized by multiple batholithic intrusions. The intrusions vary in composition and may be massive, porphyritic, or gneissic. Associated are granulite, migmatite and a few scattered remnants of sedimentary and volcanic rocks.

In the Proterozoic, the Archean rocks were subjected to several intervals of faulting, some related to intrusion of diabase dykes and carbonatite or syenite complexes, but in general, since the Kenoran Orogeny, Superior Province has behaved tectonically as a stable cratonic block.

1.3 Climate and time zones

1.3.1 Climate

Just as there are great differences in the weather throughout Canada at any given instant, there are also many climates. These climates are similar to those in Europe and Asia extending from the Arctic down to the mid-northern hemispheric latitudes. Because Canada is situated in the northern half of the hemisphere, most of the country loses more heat annually than it receives from the sun. The general atmospheric circulation compensates for this and at the same time produces a general movement of air from west to east. Migrant low pressure areas move across the country in this “westerly zone”, producing storms and bad weather. In intervals between storms there prevails the fair weather associated with high pressure areas.

Although the movement of migrant high and low pressure systems within the zone of the westerlies is the most significant climatic control over Canada, the physical geography of North America contributes greatly to the climate. On the west coast, the western Cordillera limits mild air from the Pacific to a narrow band along the coast, while the prairies to the east of the mountains are dry and have extreme temperatures because they are shielded from the Pacific Ocean and are in the interior of a large land mass. In addition, the prairies are part of a

wide north-south corridor open to rapid air flow from either north or south which often brings sudden and drastic weather changes to this interior area. On the other hand, the large water surfaces of eastern Canada produce a considerable modification to the climate. In southwestern Ontario winters are milder with more snow, and in summer the cooling effect of the lakes is well illustrated by the number of resorts along their shores. On the east coast, the Atlantic Ocean has considerable effect on the immediate coastal area where temperatures are modified and conditions made more humid when the winds blow inland from the ocean.

Table 1.7 gives temperature and precipitation data for typical stations in the various regions of Canada. Temperatures refer to observations taken in a thermometer shelter which has been placed in a representative location with the thermometer bulbs four feet above the surface of the ground. Mean January and July temperature data are based on records over the 30-year period from 1941 to 1970 except for far northern stations where the available period of record is shorter. After an average temperature is obtained for each day in January over a 30-year period, the mean January temperature may be arrived at by striking a mean of these 930 daily values. The mean July temperature may be obtained in a similar manner. The highest and lowest temperatures on record refer to the absolute extremes for the entire period of record at each station. Average dates are shown for the last occurrence in spring of a temperature of 32°F or lower and for the first occurrence in autumn of freezing temperatures at the four-foot level in the thermometer shelter.

The official Canadian rain gauge is a small cylinder in which the rain is caught and then measured to one hundredth of an inch with a simple measuring device. Freshly fallen snow is measured as it lies on the ground and recorded to the tenth of an inch. Total precipitation values shown in Table 1.7 are the sum of the total rainfall plus one tenth of the snowfall except that at airports the actual water equivalent of the snow has been measured since about 1960 in a specially designed gauge. For the purposes of this Table, a day with precipitation is one on which at least one hundredth of an inch of rain or one tenth of an inch of snow has fallen.

1.3.2 Meteorology

Meteorology, the science of the atmosphere, includes studies of the physics, chemistry and dynamics of the atmosphere and also investigates the direct effect of the atmosphere on the earth's surface, the ocean and life in general.

The federal government has been continuously involved in providing meteorological services to Canadians for over a century. The Atmospheric Environment Service is the scientific service-oriented organization which seeks to stimulate the application of meteorology to meet national needs and, through employment of new scientific knowledge and technological advances, to develop, expand and improve Canadian meteorological services to meet changing requirements for these services. The most rapid growth of meteorology in Canada was closely linked to the growth in aviation, both civil and military, during the period 1935-60. In more recent years, other sectors of the Canadian economy — industry, including agriculture, utilities, tourism, recreation and environmental problems are claiming greater attention.

The headquarters of the Service is located at Toronto. Services provided to meet civil requirements throughout Canada are largely decentralized to regional offices located at Vancouver, Edmonton, Winnipeg, Toronto, Montreal and Moncton. Each region operates several categories of offices with assigned levels of responsibility for providing weather services for the general public with additional specialized services for groups and agencies concerned with aviation, water resources, forestry, agriculture, road and rail transportation, construction and marine services.

Scientific Support Services groups have been established recently at regional offices which are capable of examining in detail the effects of weather on the activities of major sectors of the economy and of developing specialized services that might be required. For example, in British Columbia, provincial authorities and the regional office in Vancouver have worked together to arrange programs of considerable provincial importance, including the establishment of rain and snow gauge networks for hydrology studies, support for the Columbia River control system, provision of forest fire danger and slash-burning forecasts, and the provision of a frost-warning service for the fruit growing areas of the interior.

In general the weather information provided deals with current weather, expected weather and past weather in historical and statistical form. Current weather information takes

the form of hourly reports of local weather as observed at official observing sites across the country. These reports, which include temperature, humidity, cloud cover, precipitation and wind speed and direction, are of particular importance to those concerned with activities such as aviation, flood forecasting, shipping, snow removal and recreation. Daily values of temperature extremes and precipitation are also available.

Expected weather information is provided in the form of general long-range and short-range forecasts for most parts of Canada, with specific forecasts for aerodromes, inland water systems, fruit and vegetable growing areas and large urban centres. The routine forecast program is supplemented by a weather warning service that alerts the general public to hazardous conditions such as strong winds, heavy rain or snowfalls, severe cold or heat. Forecasts for the general public are distributed by relay to radio and TV stations and to the press by commercial channels. Forecasts are issued by 11 main weather offices and 56 secondary weather offices, which are supplied with sufficient information to enable them to meet local inquiries. A professional meteorologist is on staff at a number of secondary offices to provide a consultative service. Weather services are also available from Canadian Forces weather offices at Department of National Defence bases across the country.

The preparation of historical and statistical weather information involves the processing and storage of observed weather data to provide a historical record of the Canadian climate. Data are analyzed, quality-controlled and published in a variety of forms applicable to the special requirements of agriculture, forestry, water resources and other areas of activity. Special analytical projects requiring computer analysis of archived data are undertaken to provide advice to industry, science and government. Advisory services are available at most weather offices so that the inquirer receives the information in the form best suited to his needs.

A constant effort is made to exploit advances in meteorological science and technology in order to improve forecasting techniques and day-to-day meteorological services. Current programs and activities in research and development are discussed in Chapter 9.

Weather observing stations. Several networks of weather observing stations provide the information for the forecasts and advisory service and for the climatological and technical services referred to above. In December 1972, official meteorological observations were taken and recorded at 2,512 weather reporting stations in Canada. Stations range from 289 first order reporting stations, mainly at aerodromes, where hourly observations of all aspects of the weather are recorded, to the 2,223 co-operative observing stations where volunteer observers make daily observations of rainfall, snowfall and temperature. Although there are vast areas of the country where the weather observing stations are several hundred miles apart, the weather in the settled parts of the country is recorded hourly at first order reporting stations every 100 miles or so and daily at co-operative climatological stations about 25 miles apart.

Some 240 first order weather stations make complete weather observations every six hours and code them in a number form agreed upon by the World Meteorological Organization for international exchange. All six-hourly reports prepared in this number code are relayed almost instantaneously by the meteorological communications network to all weather offices across the country and are dispatched at high speed to other countries requiring Canadian observations. At the end of the month, all weather observing stations send their official observation report forms to a regional collection office, from which they are sent to headquarters for final quality-control, processing and publication. These data become part of the climatological archives and serve as a permanent record of Canadian weather.

Twice daily, at 35 locations throughout the country, upper air observations are made from ground level to altitudes up to 100,000 feet. Pressure, temperature and humidity measurements are made automatically by radiosonde instruments carried aloft by balloons and this information is relayed by a system of radio signals to ground receiving stations. The wind directions and speeds aloft are determined by measuring the drift of the balloon and attached radiosonde instruments using radar or radio direction equipment. The upper air observations are distributed rapidly to weather offices, and at the end of the month summary report forms are sent to headquarters where the data are quality-controlled, processed, published and stored.

Meteorological communications. The meteorological communications system provides the flow of information essential to a reliable weather information service. Since weather

conditions are constantly changing, the value of reports of weather observations falls off rapidly with time and the delay between taking the observation and its use in a forecast must be as short as possible. For a country the size of Canada with many sparsely settled areas, rapid communication presents difficult problems and requires unique solutions.

Weather offices and weather stations are linked coast-to-coast by land line teletype and, in remote northern areas, by radio or radio teletype. The land line teletype circuits are leased from commercial wire companies and operated by the Atmospheric Environment Service; most of the radio circuits are operated by the Telecommunications and Electronics Branch of the Ministry of Transport. Relay of all weather data is controlled by a centrally located computer in Toronto.

Two long-line weather facsimile networks transmit information in the form of weather charts, from central forecast offices to weather offices from coast-to-coast and into the northern and ocean areas by radio facsimile. Icebreakers and other ships equipped with receivers thus have the latest weather charts regularly available for guidance in their operations.

Specialized services. Although weather services are organized on a regional basis, certain specialized services can be most economically provided from a central location. Such a service is the ice reconnaissance and forecasting program to support marine activity in ice-congested waters; the program is directed from Toronto and the Ice Forecast Centre is located in Ottawa. Specially equipped aircraft are used in the aerial phase of the program and ice charts can be passed from the aircraft directly to icebreakers via radio facsimile. Other phases of the program are the provision of valuable supplemental data from shipboard ice observers assigned to eight Canadian Coast Guard icebreakers, and the operation of 110 ice reporting shore stations and 70 weekly reporting stations where ice thickness is measured. Forecast ice charts are dispatched via facsimile circuits and mailed to a wide variety of personnel and organizations having need of this information.

There are more than 2,000 climatological observing stations in Canada where observers record the precipitation and temperature extremes and send their climatological reports on monthly data sheets to Regional Data Collection Centres and then to headquarters. These data are frequently used in investigations of agricultural potential and irrigation, hydro-electric, industrial and other problems of a wide variety.

The Meteorological Applications Branch of the Atmospheric Environment Service in Toronto, using the computer and large banks of weather data which have been quality-controlled and stored, is able to provide the full range of relevant historic weather information to be applied to an increasingly wide variety of problems in which human, economic and physical activities and their weather-sensitive factors are being examined. Hydrometeorological specialists are responsible for meteorological studies in support of water resources activities involving the rivers, reservoirs and lakes of Canada including the provision of criteria for the proper design and operation of water-control structures, techniques for use in lake level, river flow and flood forecasting, and assistance in water supply and pollution investigations.

World meteorology. Canada has always co-operated with other nations in the exchange of weather data and other matters relating to international meteorology. A major area of international co-operation is with the United States National Weather Service which is now a part of the National Oceanic and Atmospheric Administration (NOAA). The two national meteorological organizations exchange data freely. Co-operative arrangements are also made for the use by Canada of data processed by the large NOAA computer facilities in Washington. Other agreements cover the marine forecasting program on the Great Lakes relating to standardization of methods of ship observations, criteria for issuing weather warnings and other similar matters.

World meteorology is organized on a global basis through the World Meteorological Organization (WMO) with headquarters in Geneva and a participating membership of 136 states and territories. Canada is an active member of this organization and fully supports its many goals. A major portion of the WMO technical program is now devoted to the World Weather Watch (WWW) – a world-wide plan for upgrading and modernizing meteorological observing networks and national weather services.

The opportunities afforded by the development of earth-orbiting meteorological satellites

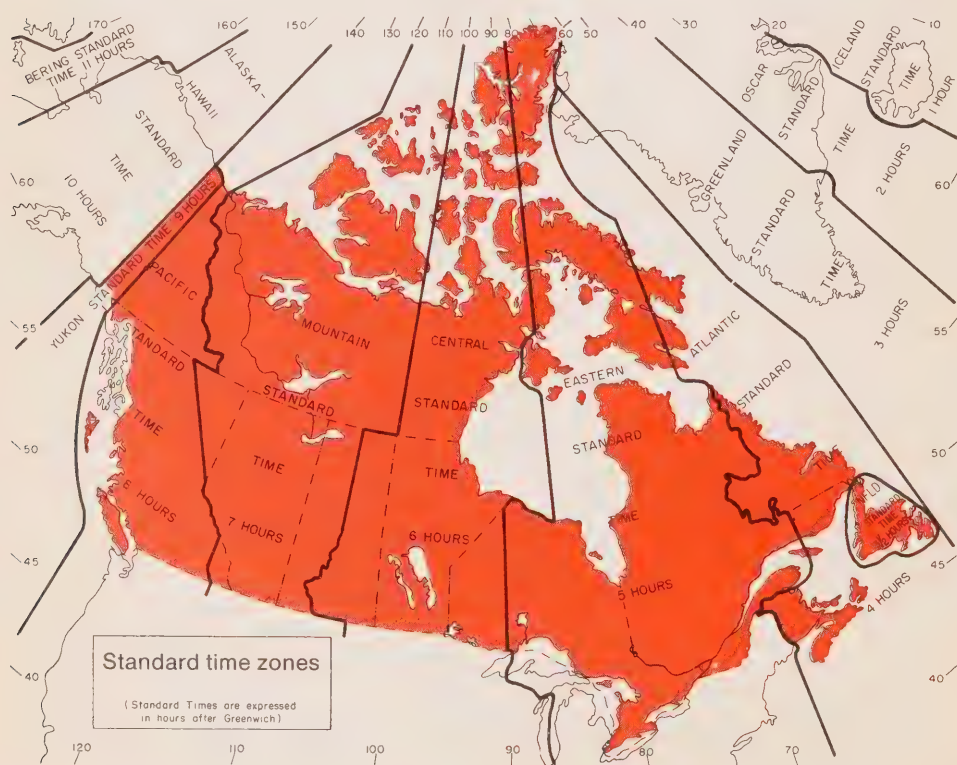

and the availability of high-speed electronic computers are being examined and both developed and developing countries are co-operating fully so that all member states of the WMO will derive full benefits from modern technology and improved meteorological services.

1.3.3 Standard time and time zones

The rotation of the earth on its axis was considered at one time to be entirely uniform and the unit of time, which is the second, was defined as $1/86400$ of the mean solar day. Improvements in clocks and in the methods of making astronomical observations demonstrated conclusively that there are irregularities in earth rotation too large to be neglected. So, in 1956 the International Committee on Weights and Measures defined the second in terms of the annual motion of the earth about the sun, called ephemeris time. In 1957 the first cesium atomic clock was calibrated with respect to ephemeris time, but not until 1967 was the cesium second adopted as the international standard. The second today is defined as 9,192,631,770 cycles of a transition of the cesium atom.

Based on atomic clocks, Canada's time is established by the National Research Council with a precision of one ten-millionth of a second per day, and co-ordination with other countries is maintained to the same precision through the *Bureau international de l'Heure* in Paris. Irregularities in the rotation of the earth give rise to a difference between mean solar time and atomic time, and leap seconds are introduced to ensure that this difference, called DUTI, does not exceed ± 0.7 seconds. At present DUTI is decreasing by about one tenth of a second per month, and positive leap seconds were necessary on June 30 and December 31, 1972.

A continuous broadcast of Canadian time is made on station CHU, Ottawa (3330 kHz, 7335 kHz, 14670 kHz), with a bilingual voice announcement each minute, and with a split pulse code to give the value of DUTI. Once a day the time signals are broadcast across Canada on the CBC networks.

Standard Time, which was adopted at a World Conference held at Washington, DC, in 1884, sets the number of time zones in the world at 24, each zone ideally extending over one twenty-fourth of the surface of the earth and including all the territory between two meridians 15° of longitude apart. In practice, the zone boundaries are quite irregular for geographic and political reasons. Universal Time (UT) is the time of the zone centred on the zero meridian through Greenwich. Each of the other time zones is a definite number of hours ahead of or behind UT to a total of 12 hours, at which limit the international date-line runs roughly north-south through the mid-Pacific.

Canada has seven time zones, the most easterly being Newfoundland Standard Time, three hours and 30 minutes behind UT, and the most westerly Yukon (west) Standard Time, nine hours behind UT. In between, from east to west, the remaining zones are called Atlantic, Eastern, Central, Mountain, Pacific and Yukon (east). Yukon (east) and Pacific Standard in effect constitute a single zone.

Legal authority for the time zones. Time in Canada has been considered a matter of provincial rather than federal jurisdiction. Each of the provinces and the Northwest Territories has enacted laws governing the standard time to be used within its boundaries. These laws determine the location of the time zone boundaries. Lines of communication, however, have sometimes caused communities near the boundary of a time zone to adopt the time of the adjacent zone, and in most cases these changes are acknowledged by amendments to provincial legislation. During the two World Wars, there were federal enactments concerning time but these were of temporary duration. In 1941 the time determined at the Dominion Observatory was designated as official time for Dominion official purposes. On April 1, 1970, this responsibility was transferred to the National Research Council.

Daylight saving time. Although Daylight Saving Time had been urged in many quarters before World War I, its first use in Canada came as a federal war measure in 1918. Today most of the provinces have legislation controlling the provincial or municipal adoption (or rejection) of Daylight Saving Time; in the other provinces the authority is left to the municipalities. By general agreement, Daylight Saving, where it is observed, is in force for six months from the last Sunday in April until the last Sunday in October.

1.4 Public land

The total area of Canada and the areas of the individual provinces and territories are classified by tenure in Table 1.8. All lands, with the exception of those privately owned or in process of alienation, are Crown lands under the jurisdiction of either the federal or the provincial governments.

Federal public land. Public lands under the administration of the federal government comprise lands in the Northwest Territories including the Arctic archipelago and the islands in Hudson Strait, Hudson Bay and James Bay, lands in Yukon Territory, ordnance and admiralty lands, national parks and national historic parks and sites, forest experiment stations, experimental farms, Indian reserves and, in general, all public lands held by the several departments of the federal government for various purposes connected with federal administration. These lands are administered under the Territorial Lands Act (RSC 1970, c.T-6) and the Public Lands Grants Act (RSC 1970, c.P-29).

The largest areas under federal jurisdiction are in the Northwest Territories and the Yukon Territory where only 93 sq miles of a total area of 1,511,979 sq miles are privately owned and 1,058 sq miles are under the administration of the territorial governments.

Provincial and territorial public land. Public lands of Nova Scotia, New Brunswick, Quebec, Ontario and British Columbia (except the Railway belt and Peace River block) have been administered since Confederation by the provincial governments. In 1930, the federal government transferred the unalienated portions of the natural resources of Manitoba, Saskatchewan and Alberta and of sections of British Columbia to the respective governments, and all unalienated lands in Newfoundland, except those administered by the federal government, became provincial public lands under the Terms of Union on March 31, 1949. All land in Prince Edward Island has been alienated except 133 sq miles under federal or provincial administration.

The transfer by the federal government of significant areas of land within and immediately surrounding established communities in the Northwest Territories and the

Yukon Territory to the administration of the respective territorial governments began in September 1970. In that year, four such transfers were completed, three in the Northwest Territories and one in the Yukon: land encompassing the city of Yellowknife (about 220 sq miles), the town of Inuvik (about 95 sq miles) and the communities of Rae-Frank Channel-Calzo (about 110 sq miles) in the Northwest Territories, and the city of Whitehorse (about 240 sq miles) in the Yukon Territory, a total of about 665 sq miles. Similar transfers will be completed during the next four years.

Information regarding provincial public lands may be obtained from the respective governments.

1.4.1 National historic parks and sites

The National Historic Parks and Sites of Canada commemorate the persons, places and events which have been declared to be of major significance in the historical development of Canada.

History. The passage of the Dominion Forest Reserves and Parks Act in 1911 was a significant milestone in the federal government's commemorative program. Prior to this date the government's involvement was through financial contributions to commemorative activities. This Act created within the Department of the Interior a Dominion Parks Board to administer national and historic parks. In 1917, Fort Anne at Annapolis Royal, NS, was transferred from the Department of the Militia and declared Canada's first national park of historic significance.

Upon the recommendation of the Commissioner of the Dominion Parks Board, a seven-member Historic Sites and Monuments Board of Canada was formed to advise the Minister on the matter of sites of national historical interest. The Board met for the first time at Ottawa on October 28, 1919.

The second national historic park was established in 1927 and by 1950 there were nine such parks, receiving over 150,000 visitors annually.

Part II of the National Parks Act of 1930 provided that the Governor in Council may set apart any land, the title to which is vested in Her Majesty as a national historic park to (a) commemorate a historic event of national importance, or (b) preserve any historic landmark, or any object of historic, prehistoric, or scientific interest of national importance, and may from time to time make any changes in the area to set apart that which he may consider expedient.

Until 1953 the Historic Sites and Monuments Board of Canada operated under Order in Council authority and no provision was made for Parliament's formal review of the Board's decisions. The Historic Sites and Monuments Act of 1953 provided the statutory base for the operation of the Board for the first time. The significant change brought about by the Act was the definition of the role of the Board as adviser to the Minister whose statutory responsibility it became to develop and implement a national program of commemorating historic sites. Further legislation was enacted in 1955 and 1959 to amend and broaden the scope of the original Act.

The Canadian Historic Sites Division, later renamed the National Historic Sites Service (NHSS), was created within the National and Historic Parks Branch of the Department of Northern Affairs and National Resources in 1955 to develop, interpret, operate and maintain historic parks and sites and to act as secretariat for the Board.

Policy. A policy statement on national historic sites was tabled in the House of Commons in 1968 by the Minister of Indian Affairs and Northern Development on the recommendation of the Historic Sites and Monuments Board of Canada. Among other things, the policy elaborated the criteria for the designation of national historic sites for the benefit of Parliament and the public.

For commemoration, a site or structure must be closely associated with a person, place or event of national historical importance, or it must illustrate the cultural, social, political, economic or military patterns of history or of a prehistoric people or archaeological discovery, or be valuable as an example of architecture.

The policy statement also included guidelines for the provision of visitor services, interpretative programs and the promotion of information to the public at large. Standards for

the preservation, restoration and reconstruction of structures were established which stressed authenticity in the materials used and in the furnishings and artifacts. The policy also recognized the need for a comprehensive program to give full thematic and geographical representation and to establish a long-range planning program to facilitate the development of parks based on such themes as exploration and social, cultural, economic and prehistoric events.

Advisers. The Historic Sites and Monuments Board of Canada has 15 members: two representatives each from Ontario and Quebec and one from each of the eight other provinces, a representative from the National Museums of Canada, a representative of the Department of Indian Affairs and Northern Development and the Dominion Archivist (ex officio). The members are generally historians or archivists of considerable distinction.

In advising the Minister on the commemoration of places, persons and events of national historical importance, the Board may recommend that sites, buildings and other structures of national importance be developed as national historic parks or historic sites or that commemoration be carried out by the erection of Historic Sites and Monuments Board of Canada plaques, or in exceptional circumstances, of distinctive monuments.

Suggestions for the establishment of historic sites and parks come from many sources — the general public, members of Parliament, historical societies and other groups, department staff and members of the Board themselves.

Before a site is referred to the Board for consideration, a background paper is prepared by Historic Sites Service research staff. The Board then determines the significance of the site and makes its recommendation, which may be either favourable or unfavourable, to the Minister. After ministerial approval has been granted to a project, a development plan is prepared.

Administration. Operational responsibility for the development and maintenance of new and existing parks and sites has been decentralized to five National and Historic Parks Branch regional offices located in Halifax (for the four Atlantic Provinces), Quebec City (for Quebec and Baffin Island), Cornwall (for Ontario), Winnipeg (for Manitoba, Saskatchewan, part of northern Alberta, the Yukon Territory and Northwest Territories, except Baffin Island), Calgary (for the southern part of Alberta, containing the Rocky Mountain Parks, and British Columbia).

The Historical Research Section of the Research Division carries out documentary research as a basis for the interpretation of parks and sites and for the guidance of archaeological activities. The Archaeological Research Section produces information for site development on the basis of field investigation and laboratory analysis and an underwater research program.

The Canadian Inventory of Historic Building is the main program of the Architectural History Section. The Inventory, begun in 1970, is a computerized screening program to survey, analyze and categorize the surviving old buildings in Canada. So far the exteriors of 95,000 buildings have been surveyed.

The Operations Policy Division is responsible for implementing and co-ordinating projects selected for commemoration and preservation. Some of the responsibilities include planning of existing and potential national historic parks and sites, designing exhibits and displays, the acquisition, restoration and conservation of military and domestic furnishings for use in parks and sites and the provision of visitor services.

Parks and sites. Since its establishment the NHSS, on the recommendation of the Board, has been instrumental in the creation of more than 70 historic parks and major sites and in the commemoration of some 650 persons and events of national (as opposed to local or regional) significance. Negotiations are being conducted with certain provinces for the acquisition of other sites already declared to be of major national historical significance. The Department has also entered into cost-sharing agreements with provincial and municipal governments and with incorporated non-profit societies for the acquisition and restoration of more than 30 architecturally or historically significant buildings on the understanding that the other party will pay the balance of the acquisition and restoration costs and will maintain the buildings in perpetuity. More than 30 monuments of distinctive nature and character which commemorate people and events significant in the nation's history are maintained by the NHSS.

A very important step toward the preservation of the nation's historic resources was taken in 1972 when the Minister of Indian Affairs and Northern Development announced the establishment of a form of National Trust in Canada, similar to those in Britain and the US, called Heritage Canada. Heritage Canada will be concerned with the conservation of buildings, sites, natural and scenic areas of importance to the country's heritage, and will receive an initial federal capital endowment of \$12 million; the interest on this fund will be used to further its work. It will seek to enlist the support of the general public and of foundations and corporations; membership will be open to anyone.

Location, year established and characteristics of national historic parks and sites were carried in the 1972 *Canada Year Book*, pp. 62-63. Eighteen more sites are described here. Many more are in process of restoration or development and full details may be obtained from the Department of Indian Affairs and Northern Development's publication *National historic parks/sites*.

Cape Spear, Nfld., eight miles south of St. John's. 1968. Most easterly point North American continent. Stabilized very early lighthouse, World War II heavy coastal defence gun battery.

Fort Amherst, Rocky Point across Harbour, Charlottetown. 1967. Remains 1758 earthworks British fortification. Modern visitor reception/interpretation centre. Large area landscaped grounds, ground interpretation signs.

Montmorency Park, Quebec City. Landscaped park, contains restored remains of fortification walls with period artillery pieces in place. Named after Msgr. de Laval de Montmorency.

Chateauguay, Chateauguay, Que. 1929. Site of Battle of Chateauguay Forks 1813. Monument on site.

Rainbow Bridge, Niagara Falls, Ont. Located in building at Canadian end of Rainbow Bridge, didactic interpretative display; theme: national and provincial historic sites in Ontario.

Rideau Canal General, Ottawa to Kingston. 1972. Constructed 1828-1832 British military engineers under Col. By, 123 miles in length, 41 locks. Now used as recreational waterway, Kingston to Rideau Lakes/River system to Ottawa River.

Jones Falls, Ont. 1972. Massive stone masonry dam, four locks, on Rideau Canal system, remains of defensible canalman's residence.

Merrickville, Ont. 1972. Masonry dam, three locks, stabilized masonry and timber defensive blockhouse which houses local historical museum.

Narrows, Crosby, Ont. 1972. One lock, between upper and lower Rideau Lakes; preserved masonry and timber defensible blockhouse.

Newboro Locks, Ont. 1972. One lock, stabilized masonry and timber defensible blockhouse.

Kingston Mills, Ont. 1972. Two locks, preserved masonry and timber defensible blockhouse.

Ottawa, Rideau Canal System. 1972. Eight flight locks, preserved/restored; old Commissariat structure houses local Colonel By museum.

Fort St. Joseph, St. Joseph Island, west end North Channel Lake Huron, Ont. 1928. Few remains of British earthworks and masonry fort, built 1796; served the fur trade and as Indian agency; destroyed by Americans 1814.

Battle of the Windmill, Prescott, Ont. 1923. Wind-operated gristmill built circa 1828. Structure stabilized and preserved, now used as lighthouse navigational aid; site of battle 1837-38 rebellion in Upper Canada; site may be visited but structure not open to public.

S.S. Keno, Dawson City, YT. 1962. Preserved Yukon river boat; stern-wheeler maintained and interpreted to illustrate early 20th century northern river transport; set in cradles on land in winter storage position.

Palace Grand Theatre, Dawson City, YT. 1962. Restored and reconstructed theatre first built and finished to "grand" scale circa 1900, interpreted to illustrate Gold Rush days entertainment features; active live theatre during visitor season.

S.S. Klondike, Whitehorse, YT. 1971. Large sternwheeler, flat bottomed Yukon river boat, to be laid up in cradles in winter storage position. To be restored to working day configuration and to be focal point of interpretative display with theme of water-borne transportation.

Bonanza Creek, near Dawson City, YT. Site of first claim staked in Klondike Gold Rush 1897-98; interpretation to illustrate evolution of placer mining techniques.

1.4.2 National parks

Canada's national parks are the visible evidence of the federal government's efforts to preserve natural areas of outstanding scenic and biological interest for the benefit of the public. The national park concept, which began with the establishment of Yellowstone National Park in the United States in 1872, was soon afterwards applied in Canada. In 1885, the Canadian government reserved from private ownership the mineral hot springs of Sulphur Mountain in what is now Banff National Park. Two years later, this ten-sq-mile reserve was extended to 200 sq miles and named Rocky Mountains Park, the first federal park in Canada. In the same year, Queen Victoria Niagara Falls Park, the first provincial park, was established by the Ontario government to protect the public's right to view the great natural wonder of Niagara Falls. Two land reserves in southern British Columbia – Yoho and Glacier – were made by the federal government in 1886, a reserve of 54 sq miles in the Waterton Lakes area of southern Alberta in 1895, and an area of 5,000 sq miles around Jasper, Alta., in 1907. These four reserves, all in the western mountain ranges, together with Rocky Mountains Park, formed the nucleus of the national park system after the Dominion Forest Reserves and Parks Act was passed by Parliament in May 1911. Concurrently, a distinct National Parks Branch was created in the federal government to protect, administer and develop the parks.

National parks are now under the jurisdiction of the Minister of Indian Affairs and Northern Development and are administered by the National and Historic Parks Branch under the National Parks Act, 1930 (RSC 1970, c.N-13) and various park regulations. The purpose of the parks and the objectives of their management are set out in the Act, which dedicates the parks to the people of Canada for their "benefit, education and enjoyment" and states that they are to be maintained and used so as to leave them unimpaired for the enjoyment of future generations.

By 1930, nine more national parks had been established. Three of these were in Ontario and consisted of federally owned Crown land or land held in trust for Indians – St. Lawrence Islands National Park (1914), Point Pelee National Park (1918) and Georgian Bay Islands National Park (1929). One in Saskatchewan – Prince Albert National Park (1927), and one in Manitoba – Riding Mountain National Park (1929), were former federal forest reserves. Elk Island National Park near Edmonton was established in 1913 as a preserve for buffalo and in 1922 Wood Buffalo National Park, a 17,300-sq-mile area straddling the Alberta - Northwest Territories border, was established as a refuge for the largest surviving herd of buffalo in North America. In British Columbia, through agreement between federal and provincial governments, two scenic areas were established as national parks – Mount Revelstoke National Park (1914) and Kootenay National Park (1920).

Between 1930 and 1972, the following were added to the chain of Canada's national parks: Northwest Territories – Nahanni (1972) and Baffin Island (1972); Yukon Territory – Kluane (1972); British Columbia – Pacific Rim (1970); Ontario – Pukaskwa (1971); Quebec – La Mauricie (1970) and Forillon (1970); New Brunswick – Kouchibouguac (1969) and Fundy (1947); Nova Scotia – Cape Breton Highlands (1936) and Kejimikujik (1968); Prince Edward Island – Prince Edward Island National Park (1937); Newfoundland – Terra Nova (1957) and Gros Morne (1970).

In the case of parks in the Yukon Territory and Northwest Territories, lands have been reserved from all alternative disposition by Order in Council. Within provinces, land is acquired by the province acting within a federal-provincial agreement to establish a national park. These lands are transferred to Canada and the establishment of the park is formalized by Parliament, adding the boundary description in a schedule to the National Parks Act.

In 1971 *The national parks system planning manual* was published, in recognition that new and comprehensive measures are needed to preserve Canada's natural heritage. With a view to protecting not only unique and outstanding areas of the Canadian landscape, but also those representative of its physical and biological characteristics, 41 distinctive natural regions were identified within which natural history themes have been defined.

The establishment of four new parks representing several of these natural regions, which was announced in 1972, brought the total number of parks to 28. Encompassing 49,900 sq miles the system is now the largest and most rapidly expanding in the world. It is intended that there will be 40 to 60 national parks in Canada's national parks system by the year 2000.

A detailed list of national parks was included in the 1972 *Canada Year Book*, pp. 60-62.

The location and characteristics of three parks established in 1972 are as follows:

Kluane, southwestern region of Yukon Territory, 8,500 sq miles. Canada's highest mountains, most extensive icefields and glaciers, fine wildlife populations; accessible by highway.

Nahanni, southwestern region of Northwest Territories, 1,840 sq miles. Wilderness area including South Nahanni River; three deep canyons and spectacular Virginia Waterfall, numerous hot springs, interesting flora; not yet accessible by highway.

Baffin Island, on Cumberland Peninsula of Baffin Island, 8,290 sq miles. Scenic area with fjords and deeply carved mountains; numerous glaciers extend from Penny Ice Cap (second largest icefield in world); interesting wildlife; not accessible by highway.

A location map and details of these parks is available in *Canada's national parks* published by the Department of Indian Affairs and Northern Development.

An important step in the evolution of national park administration was taken when all policies concerning the parks were reviewed, amended and consolidated in a statement that was approved by the federal government and announced in the House of Commons on September 18, 1964. Following are the main points of this policy statement, which will guide administration and provide objectives for planning and development.

(1) National parks are established to preserve for all time the most outstanding and unique natural features of Canada for the benefit, education and enjoyment of Canadians as part of their natural heritage. They are dedicated forever to one use — to serve as sanctuaries of nature for rest, relaxation and enjoyment. No exploitation of resources for any other purpose is permitted. All development must contribute to public enjoyment and conservation of the parks in a natural condition.

(2) Zoning will be used to guide development and to preserve park values. Visitor services will be grouped generally into visitor service centres, a definition that applies to existing town sites.

(3) National parks cannot meet every recreational need; the most appropriate uses are those involving enjoyment of nature and activities and experiences related to the natural scene.

(4) The federal government assumes the cost of administration and protection in the parks and provides basic facilities for public use, such as roads, trails, campgrounds, picnic areas, nature interpretation and utilities. Other facilities beyond basic requirements, such as hotels, motels, restaurants, gas stations, stores and other special services, are provided by private enterprise.

(5) Park residents and businesses should be in the same economic position as those operating outside the national parks and this principle governs the approach to charges, rentals and fees. The users of special services such as swimming pools, marinas, golf courses and fully serviced campgrounds should pay the operation and maintenance costs of these publicly operated facilities. In general, permanent and seasonal residents should be limited to persons providing basic services to the park community.

(6) All decisions affecting public development and the activities of private enterprise must be governed by the national interest as expressed by the National Parks Act.

The National Parks and National Historic Parks and Sites are administered by the five regional directors who are responsible for operations in the Western Region (Alberta and British Columbia), Prairie Region (Manitoba, Saskatchewan, Yukon Territory and Northwest Territories), Ontario Region, Quebec Region (plus the new Baffin Island National Park), and the Atlantic Region which includes the Maritime Provinces and Newfoundland. A resident superintendent manages each park and has the assistance of a staff of wardens who protect the park and its natural features and enforce regulations, naturalists who explain the park to visitors and offer various educational services, and other administrative, maintenance, and visitor service personnel. A somewhat similar organizational structure exists on a smaller scale in each national historic park.

There are campgrounds in most parks; daily charges are \$2.00, \$3.00 or \$4.00, depending on services provided.

There is free entry to some parks, including those in the Atlantic Provinces. A \$1.00 permit is valid from a day to a year in Elk Island, Prince Albert, Riding Mountain and St. Lawrence Islands National Parks. The \$2.00 annual fee charged for most western parks permits entry to all parks except Point Pelee National Park in Ontario for which the \$5.00 annual licence includes complimentary use of the park's transit system. Trailer fees vary from 50 cents per day to a \$1.00 annual permit, valid in all national parks.

Each park is developed to yield the recreational/conservational potential for which it is suited. Sightseeing, camping, fishing, hiking, photography and nature study are the most popular forms of recreation common to the parks now accessible to the public. A program was initiated in 1970 to encourage national, provincial and local associations and private citizens to

express their views at special public hearings on development plans for specific parks.

In order to accommodate the increasing number of visitors to Canada's national parks and to include representative and rare examples of the Canadian landscape, Canada's national park system has, in the past few years, expanded more than at any other time in its history.

In 88 years, through co-operation between provincial and territorial governments, Canada's national park system has grown to become the world's largest. In 1972, 15 million persons visited the parks.

To ensure that natural areas are protected and man's endeavours are recognized and interpreted for future generations, the National and Historic Parks Branch of the Department of Indian Affairs and Northern Development is extending its program of National and Historic Parks and Sites in four new directions — canal systems, national marine parks, national landmarks, and wild rivers.

Canal systems. Eight historic canals and waterways in Ontario, Quebec and Nova Scotia will be developed for natural and historic significance. These canals not only provide a broad spectrum of water recreation activities, but give interesting insights into Canada's early years when they were important transportation links.

In Ontario, the 240-mile Trent-Severn Canal links Lake Ontario to Georgian Bay with 43 locks, one marine railway, 33 miles of artificial canal channels and 207 scenic miles of lake and river channels. Navigation time through each lock is 15 to 20 minutes. The 125-mile Rideau Canal connecting Kingston to Ottawa winds through a section of the beautiful Rideau Lakes region. There are 47 locks. Passage time through each is 10 to 15 minutes. Twelve miles of the waterway is artificial canal, while the remainder of the route uses lake and river channels.

In the Quebec system are the 45-mile Richelieu River route connecting Lake St. Peter with Lake Champlain, which includes nine locks in the 12-mile Chambly Canal and the St. Ours Lock, and the Ottawa River route which includes the Carillon and Ste. Anne locks. On Cape Breton Island, the half-mile St. Peters Canal runs from Bras d'Or Lakes to the Atlantic Ocean.

National marine parks. Canada is bounded by three oceans and more than 150,000 miles of coastline. It also has the largest volume of fresh water in the world. The national parks system will be extended to include representations of the Pacific, Arctic and Atlantic coasts and inland waters, with identification of Marine Natural Regions and Marine Natural History Themes. Development of a National Marine Park in the Georgia Strait is under consideration, and eight other regions offer immense possibilities to enjoy and interpret marine areas.

National landmarks. Preservation of specific natural wonders, such as the Chub crater in northern Quebec, the frozen pingoes of the Arctic, semi-desert and eroded hills of the Prairies and mountain caves and sea-scapes, would allow on-site interpretation of Canada's natural evolution.

Wild rivers. Many undeveloped Canadian rivers — some with historic appeal — are being surveyed as potential wilderness routes.

Historic waterways, land trails and scenic parkways. In addition to canals, marine parks, landmarks and wild rivers, the National and Historic Parks Branch plans three other areas of development in its Byways and Special Places program, encouraging Canadians to embark on "journeys of discovery". Historic water routes, which will include the historic canals, will be developed in co-operation with provincial governments, opening systems of historic waterways across the nation. Historic land trails will be developed for the hiker, horse rider, cyclist, and cross-country skier in co-operation with the provinces and municipalities. Both of these developments will link history with leisure, providing further access to our human heritage. Scenic parkways will lure motorists from super highways to leisurely drives throughout the countryside. These routes would provide access to nature trails, picnic sites, campgrounds, historic sites and, where possible, national and provincial parks.

Gatineau Park. In addition to the national parks described above, there is a 138-sq-mile recreation area known as Gatineau Park north of the cities of Ottawa and Hull. Although not designated as a national park, this area is being developed by the federal government as part of the National Capital Region and is under the care of the National Capital Commission. It is a wilderness area of great potential, extending northward from Hull for 35 miles. It now has 25 miles of parkway, magnificent lookouts, lakes, fishing streams, beaches, picnic areas, camping

sites and walking trails and is already one of the finest recreation areas in Canada, enjoyed by nearly 1.8 million visitors each year. A master plan for its further development is under way.

1.4.3 Provincial parks

Most of the provincial governments of Canada have established parks within their boundaries. Some of these, particularly in Quebec and Ontario, are wilderness areas set aside in order that some portions of the country might be retained in their natural state without change brought about by the hand of man. Most of them, however, are smaller areas of exceptional scenic or other interest which are easily accessible and are equipped or slated for future development as recreational parks with camping and picnic facilities. The more important parks in each province are mentioned briefly in the following paragraphs.

Newfoundland. Altogether, 3,151 sq miles of wilderness, reservation, park lands and public beaches are administered by provincial government agencies. Of this land, 2,785 sq miles are contained within two wilderness areas administered by the Wildlife Division of the Department of Tourism. The remaining 366 sq miles of development and reserved public park land are under the jurisdiction of the Provincial Parks Division of the Department of Tourism. Of that area, 106 sq miles are in 46 developed provincial parks; two sq miles in protected public beaches; and 258 sq miles in 16 provincial park reserves. Operation of these parks is directed toward preservation of the natural environment and most of them are located in wilderness areas, developed only for picnicking and camping. Regulations prohibit hunting and other types of resource exploitation; sports fishing, however, is encouraged. There is a continuing upward trend in the number of park users, both in day-use and overnight areas.

Prince Edward Island. Twenty areas have been developed as provincial parks including Strathgartney Park, a 40-acre tract of land on the Trans-Canada Highway between Charlottetown and Borden, which is an excellent picnic site and campground with its hardwood groves, fresh spring water and beautiful view over the West River and the surrounding country; Lord Selkirk Park, an area of 30 acres at Eldon, is of historic interest in that it contains an old French cemetery and marks the spot on the shoreline where Lord Selkirk landed; Brudenell River Park and Golf Course, comprising 296 acres at Roseneath, has a considerable area of woodland and runs to the shore of the Brudenell River; Jacques Cartier Park, an area of 22 acres at Kildare Beach four miles from Alberton, is of historic significance as the place where Jacques Cartier first landed on Prince Edward Island; Green Park, 45 acres on the Trout River, is an attractive combination of land, trees and water and is also of interest as a historic shipbuilding centre; Cabot Park at Malpeque, named in honour of the famous explorer, John Cabot, is a 54-acre area with beautiful sandy beaches and an interesting museum; and several small parks have been developed or are under development. A fee of \$4.00 is charged for serviced tent and trailer sites and of \$3.00 for unserviced sites. The parks are maintained by the Department of the Environment and Tourism.

Nova Scotia. The provincial park system, which is administered by the Department of Lands and Forests, consists of 17 overnight campground parks, 46 day-use picnic parks and seven day-use beach parks. Campground parks are located near the major highways throughout the province, and are designed to provide overnight camping accommodations; however, they usually contain a day-use picnic ground as well. They vary in size from 65 to 1,200 acres, and have from 30 to 175 campsites. Basic facilities include potable water, vault toilets and picnic tables. There are no service hook-ups. Picnic parks are designed as roadside day-use rest areas, and are located at 20- to 40-mile intervals along major highways (other than on controlled access routes). They vary in size from less than one acre to more than 200 acres and are provided with basic facilities similar to those in campground parks. Day-use beach parks are designed to serve as recreational areas, and are provided with picnic tables, potable water, vault toilets, and change houses. Additional good quality beaches are being developed, dependent upon demand and location. The overnight camping fee is \$2.50 per party per night. There are no vehicle entry permits or day-use fees. The provincial park system provides about 10% of the total number of campsites in the province, with the national park system providing about 15% and the private sector the remaining 75%.

New Brunswick. The New Brunswick provincial park system, which is administered by the Department of Tourism, includes 24 recreational parks ranging in size from 25 to 1,400 acres, 26 picnic-ground parks, 11 campground parks, eight beach parks, a marine park and a resource

park. Most of the park sites are located in rural areas, fairly evenly distributed throughout the province, and are adjacent to or easily accessible from main trunk roads. All parks contain tables, some form of toilet facility and a potable water supply, but more elaborate facilities are available in the larger parks. A vehicle fee is charged at some parks and a daily camping fee of \$2.00 to \$2.50 is in effect at 25 of the larger parks, subject to change without notice. The Department also maintains a wildlife park at Woolastook near Fredericton where various species of wildlife to be found in the province are displayed. In 1971, almost 3.8 million persons visited the provincial parks, 203,000 of them campers; 75% of the campers using park sites came from outside the province. Several parks have organized activity programs and supervised swimming with qualified life-guards. Mactaquac, near Fredericton, one of two year-round parks boasts a championship 18-hole, 7,030-yard golf course, two marinas, and an interpretative program with naturalists on staff. During the winter there are facilities for snowmobiling, cross-country skiing, snowshoeing, tobogganing, skating, sleigh rides and camping. Sugarloaf, near Campbellton, the other year-round park features an alpine ski hill with three lifts, cross-country skiing, snowmobiling and tobogganing. In the past few years services on the 54,000 acres of parkland New Brunswick maintains have been expanded and improved so that the visitor is offered a full and versatile recreational program.

Quebec. The major parks in Quebec extend over almost 75,000 sq miles, about 13% of the area of the province. Excluding James Bay Park, they cover nearly 20% of the forest area south of the 52nd parallel. There are 30 major parks, the oldest of which are Mont-Tremblant Park, 80 miles north of Montreal, dating back to 1894 and Laurentide Park, 30 miles north of Quebec City, to 1895. The former covers 990 sq miles, and the latter 4,059 sq miles. Gaspé Park, an area of 498 sq miles, was established in 1937 chiefly to protect the caribou, then threatened by extinction; a herd of caribou can now be found on Mount Albert. The same concern for the future of these animals prompted the creation of Laurentide Park in 1895. Unfortunately, in spite of the protection afforded, the caribou eventually disappeared; however, they have since been successfully re-introduced. La Vérendrye Park, 140 miles northwest of Montreal, was created in 1939 as the Mont Laurier - Senneterre Highway Fish and Game Reserve. In 1950, the Quebec government gave the territory its present name in honour of the famous Canadian explorer, Pierre Gaultier de Varennes, Sieur de La Vérendrye, who discovered the Rocky Mountains. This vast and open area of wilderness now extends over 5,257 sq miles. In 1938, an Act provided for the creation of Mont-Orford Park, west of Sherbrooke. Although much smaller in size, only 15 sq miles, this regional park is a recreation-intensive ground where camping is very popular. Since then, more than 20 parks have been successively created, the major ones being: Chibougamau, Port-Daniel, Mistassini, Rimouski, Matane, St. Maurice, Port-Cartier - Sept-Îles, Portneuf, Mastigouche, Joliette and Labelle. These parks are administered directly by the Parks Branch of the Department of Tourism, Fish and Game.

As far as open-air recreation is concerned, fishing has always been the most popular activity in Quebec parks. In 1971, the Department of Tourism, Fish and Game established three new parks — Mastigouche, Joliette and Labelle — to allow access to many lakes and rivers in the proximity of large urban centres. Papineau Park, created in 1965, was also made accessible to a larger public when it was formed into the double Papineau - Labelle Park. To allow as many as possible to use these new facilities, fishing "by the day" was instituted, whereby anglers may reserve an area for one day at a time; reservations may be made 48 hours in advance on a first-come, first-served basis by phoning the park reception centres. The Quebec government has also set aside several rivers as fishing reserves for public use, including the St. Jean, Petite Cascapédia, Matapédia, Ste. Anne, Cap Chat and Matane Rivers in the Gaspé area, the Moisie and Laval Rivers on the north shore of the St. Lawrence, and the Petit Saguenay, a tributary of the Saguenay River. Salmon is the principal catch. Hunting was generally prohibited in the parks until 1962. Moose hunting for wildlife-management purposes is now allowed, for Quebec residents only, in the following parks: Laurentide, La Vérendrye, Matane, Portneuf, Mont-Tremblant, St. Maurice, Haute-Mauricie and Dunières. Hunting is permitted in Rimouski Park under certain conditions. In 1972, small game hunting was also permitted in Papineau - Labelle, Mastigouche, Joliette, Portneuf and St. Maurice Parks.

The growing popularity of camping by the local population and visitors to Quebec has led the Parks Branch to increase the number of campsites as a supplement to the network of

privately operated sites. In eastern Quebec, provincial campsites are located at Carleton, Port-Daniel, Moisie, Mont St. Pierre, Percé and Trois-Pistoles; at Îles-de-la-Madeleine, there are camping grounds at Grande-Entrée and Gros-Cap. Closer to Quebec City are St. Alexandre (Kamouraska), Montmagny, St. Jean (Île d'Orléans), Stoneham, Villeneuve, Vincennes (Beaumont), and St. Joseph (Beauce). More or less surrounding Metropolitan Montreal are Mont-Orford, des Voltigeurs (Drummondville), Côte-Sainte-Catherine, Paul-Sauvé (Oka), Dollard-des-Ormeaux, Pointe-des-Cascades, Coteau-Landing and Sainte-Véronique.

To meet the need of snowmobilers the government, during the winter of 1971-72, provided safe and attractive trails in several parks, especially Laurentide, Portneuf, St. Maurice, Paul-Sauvé (Oka), Mont-Tremblant, Joliette and Mastigouche. Cross-country skiing has become a favourite sport especially for families and groups of friends. The Parks Branch laid out trails in some parks, particularly in the Mercier Camp area of Laurentide Park where heated facilities were installed. Trails are well marked and of various lengths and degrees of difficulty. Mont-Orford, Mont-Tremblant and Paul-Sauvé parks also received large numbers of cross-country skiing and snowshoeing enthusiasts.

Ontario. In 1971, 113 provincial parks were available for public use in Ontario and several new parks were in process of development; 99 other areas, comprising 1,909 sq miles, were held in reserve for future development. The total area of the Ontario provincial park system was about 16,067 sq miles. The parklands are administered by the Parks Division of the Ministry of Natural Resources. The seven largest parks — Polar Bear, Algonquin, Quetico, Lake Superior, Missinaibi, Killarney and Sibley — together have an area of about 12,725 sq miles. Polar Bear Park is the largest in the system, occupying 7,000 sq miles of Hudson Bay Lowland bordering Hudson and James bays containing boreal forest, tundra and arctic flora and fauna. Algonquin Park is a beautiful area 2,910 sq miles in extent, 180 miles north of Toronto and 105 miles west of Ottawa; it has 14 picnic and camping areas which are accessible by car from Highway 60 and offers particularly fine canoeing opportunities in its interior. Killarney Park is accessible by Highway 637 from Highway 69 south of Sudbury. Quetico Park, covering 1,750 sq miles, is accessible by Highway 11 at the Dawson Trail Campground on French Lake and also by water by way of Basswood Lake in the south. Highway 17 north from Sault Ste. Marie gives access to Lake Superior Park, and Sibley Park may be reached by road from Highway 17 east from Thunder Bay. Missinaibi Park, 176 sq miles in extent, surrounds Missinaibi Lake, 55 miles north of Chapleau. The lake is renowned for walleye fishing and is the site of an important Hudson Bay trading post.

Under the Wilderness Areas Act of 1959, 40 areas have been established, widely distributed across the province. They vary in size, character and significance but all were established as being important for their historic, scientific, aesthetic or cultural values. The largest is a 938-sq-mile block covering the Pukaskwa area on the north shore of Lake Superior. Most other wilderness areas are one sq mile or less in size.

In 1967 a policy of park classification and parkland zoning was established to achieve a balanced park system and to provide a framework for positive and effective development and management. Five park classes were established — primitive, natural environment or heritage, wild river, nature reserve, and recreation. Comparable zones within parks were also established — primitive, natural, historic, multiple use, and recreation. Some areas once protected under the Wilderness Areas Act for their scientific values are being changed in law to be protected as nature reserves under the Provincial Parks Act. There are now six nature reserves, four of which were previously under the Wilderness Areas Act. All nature reserves contain natural features and phenomena that are either unique or typical of the primitive or contemporary landscapes which together form the ecological mosaic of Ontario. By the end of 1970, there were five wild river parks in existence, three of which, all located in the central section of northern Ontario, were established during the year: Mississagi, Chapleau - Nemegosenda and Lady Evelyn.

To meet the rising pressures for recreational space Ontario created the North Georgian Bay Recreational Reserve which covers 4,500 sq miles of interesting country lying generally between Algoma and Parry Sound on the north shore of Georgian Bay and includes the channel between Manitoulin Island and the mainland, the 30,000 islands, the famous route of the voyageurs by way of the French River, the remaining shoreline of Lake Nipissing and the La Cloche Mountains. The Reserve is not a provincial park nor is it a Wilderness Area but an

area following a normal course of development which is already used extensively for recreation. The plan is, by guiding the evolution of the area, to realize its full potential as a recreational paradise serving all types of needs and co-existing with a landscape of normal activity.

Ontario's vast lakeland areas make this province a vacation paradise and the number of park visitors increases year by year. In 1971, 13,658,619 persons attended, of whom 1,502,216 were campers making use of the 18,941 campsites provided for them. The charge for vehicle entry in 1971 was \$1.50 per day or \$15 per year, and the camping charge was \$3.50 per night which included vehicle entry. Picnic tables, fireplaces, fuelwood, tested drinking water and washrooms are provided at supervised tent and trailer campgrounds and all parks have trailer sanitation stations. Interpretative and naturalist programs are being expanded continually and such services as museums, outdoor exhibits, conducted trips, illustrated talks and labelled nature trails are available in many parks.

Manitoba. The provincial parks system of Manitoba, administered by the Parks Branch of the Department of Tourism, Recreation and Cultural Affairs, consists of four major classifications of outdoor recreation development: provincial parks, which are large area parks with a variety of natural attractions suited to outdoor activities; recreation areas, the natural attractions of which are modified to accommodate recreation activities of an intensive nature; waysides, which are located on most highways to enhance travel routes and provide attractive rest spots; and heritage areas, which are areas of outstanding scenic beauty or have natural, physical or historic features of special local interest.

There are ten provincial parks in Manitoba. Birds Hill Provincial Park comprises 8,400 acres and an 80-acre man-made lake within easy reach of the Manitoba capital. In south-central Manitoba, Spruce Woods Provincial Park is set in an area thriving with wildlife, woods and wildflowers along the valley of the Assiniboine River, and also features lookouts over the shifting sand dunes of the Bald Head Hills, the province's only truly desert area. Near the western boundary, Assinippi Provincial Park is under development on the southern end of a 45-mile-long man-made lake behind the Shellmouth Dam on the Assiniboine. The Shellmouth reservoir will provide for development of water-based facilities on a large scale for western Manitoba residents and visitors. Hecla Provincial Park with an area of 333 sq miles in the southern section of Lake Winnipeg is the most recent addition to the parks system. This park includes a group of islands of which Hecla is the largest. Grindstone Point, adjacent to Hecla Provincial Park, is also being developed as a recreation area in conjunction with the park. Hecla Island is connected by causeway to the mainland and Highway 8. Park developments will offer resort facilities for water sports, hiking, snowmobiling, hunting and fishing and will include a marina and an interpretative centre. Hecla village will be developed as a historic Icelandic fishing site.

Manitoba provincial parks have a total area of about 3,385 sq miles. In addition, there are 44 recreation areas ranging in size from four to 2,364 acres, and more than 87 roadside facilities. The park system contains 55 campgrounds. Hunting and fishing lodges are common and accommodation in some of the parks ranges from modern resorts and motels to hotels and cabins. Golf, tennis, boating, swimming, fishing, riding and hiking facilities are available, as well as children's playgrounds. A major ski area and a system of snowmobile trails provide for growing participation in winter outdoor activities. There are 73 commercial concessions operating within the parks system, offering a variety of services ranging from restaurants to riding stables and marinas.

Rehabilitation and expansion of existing recreation areas are continuing in an effort to provide new camping and improved day-use facilities. Development is continuing, too, in the heritage-area program to preserve and interpret sites, large and small, illustrating the natural and human history of the province. Surveys have been conducted to study potentials along the shores of Lake Winnipeg, along the rivers flowing into Lake Winnipeg from the east and to provide guidance for future development of recreational facilities in Manitoba's Interlake area. In northern Manitoba studies are being made along the Nelson and Churchill Rivers.

Popularity of the Manitoba provincial parks and recreation areas is indicated by impressive annual increases in the number of park visitors. In the three years ended March 31, 1972 the numbers were estimated at 2,420,000, 2,650,000 and 3,058,000, respectively. An estimated 114,946 families and groups in tents, trailers and truck campers utilized campground

facilities across the province in the 1971-72 fiscal year. The admission fee to Manitoba's provincial parks is \$1 per day or \$5 for the season.

Saskatchewan. Saskatchewan's 15 provincial parks, comprising 1,821 sq miles of recreation land, range from forested parklands in the midst of the sprawling prairie and valley parks between the soft hillsides of the legendary Qu'Appelle Valley to rugged northland settings. Each park offers camping, picnicking, boating and swimming facilities and a variety of recreational activities. Eleven of the parks operate a supervised recreation program of regularly scheduled activities for all ages - arts and crafts, hikes along park nature trails, social functions and numerous team sports. Moose Mountain boasts a split-fieldstone chalet and other modern cabin accommodation. Cabin facilities are also found at Cypress Hills, Battlefords, Duck Mountain and Greenwater Lake parks. Golf courses are found at Cypress Hills, Moose Mountain and Duck Mountain parks. The unique forest cover of stately lodgepole pine and white spruce in Cypress Hills Park provides cover for elk, antelope, deer, beaver, sharp-tailed grouse and quiet trout-stocked streams. In Duck Mountain, Moose Mountain and Greenwater Lake parks, moose, elk, and bear appear randomly and deer and beaver are common to all, as are several varieties of grouse and many species of waterfowl and smaller land birds. Pike, pickerel and perch abound in almost all park lakes and brook and rainbow trout are ardently sought in northern waters. Canoe routes and commercially operated fishing and hunting camps are found in the province's three semi-wilderness parks - La Ronge, Nipawin and Meadow Lake. Hundreds of roadside camp and picnic grounds are in operation. Four official campgrounds and several other camping areas dot the province's 406-mile stretch of Trans-Canada Highway. Saskatchewan also operates 83 regional parks which, although designed primarily with local patrons in mind, attract large numbers of tourists. Davidson Park, associated with the largest earth-fill dam in Canada, has a modern visitors' centre with cafeteria and interpretative displays. A 40,000-acre wilderness area in east-central Saskatchewan is appropriately named Wildcat Hill. Marked sites of historic interest total 143 and include the Wood Mountain NWMP Post, Last Mountain House, Touchwood Hills, Cannington Manor, Steele Narrows, Fort Carlton and Cumberland House historic parks.

Alberta. Alberta has 51 provincial parks containing 218 sq miles; 46, with a total area of approximately 208 sq miles, are in use and continuing development. Cypress Hills Provincial Park with an area of 78 sq miles is the largest and is situated in the southeast portion of the province. Other parks are: Aspen Beach, Beauvais Lake, Big Hill Springs, Big Knife, Bow Valley, Bragg Creek, Calling Lake, Chain Lakes, Crimson Lake, Cross Lake, Dillberry Lake, Dinosaur, Dry Island Buffalo Jump, Entrance, Garner Lake, Gooseberry Lake, Gregoire Lake, Hasse Lake, Hommy, Jarvis Bay, Kinbrook Island, Lac Cardinal, Lesser Slave Lake, Little Bow, Little Fish Lake, Long Lake, Ma-Me-O, Miquelon, Moonshine, Moose Lake, O'Brien, Park Lake, Pembina River, Pigeon Lake, Police Outpost, Red Lodge, Rochon Sands, Saskatoon Island, Sir Winston Churchill, Taber, Thunder Lake, The Vermilion, Tillebrook, Trans-Canada Campsite, Wabamun Lake, Williamson, Willow Creek, Winagami Lake, Woolford, Writing-On-Stone, Youngs Point. These parks, which are generally provided with picnic, camping and playground facilities, are maintained by the Department of Lands and Forests, Provincial Parks Division, primarily for the recreation and enjoyment of residents and visitors. There is a park within easy reach of almost every town. The most northerly park is Gregoire Lake, about 20 miles south of Fort McMurray, and the southernmost park is Police Outpost which adjoins the Alberta - Montana border. Alberta's provincial parks were visited by 4,752,023 tourists and vacationers between April 1, 1971 and March 31, 1972.

In addition to the recreational parks, 26 sites have been established to mark and preserve locations of historical interest. They are Athabasca Landing, Buckingham House, Bugnet Plantation, Coronation Boundary Marker, Early Man Site, Fort DeL'Isle, Fort George, Fort Vermilion, Fort Victoria, Fort White Earth, Frog Lake Massacre, Grizzly Bear Telegraph Station, Hay Lakes Telegraph Station, Head-Smashed-In Buffalo Jump, Massacre Butte, Ribstones, Rocky Mountain House Fort, Standoff, Stephansson, Twelve Foot Davis, Shaw Woolen Mill, Rev. George McDougall's Death Site, McLeod Fort, Indian Stone Pile, St. Joseph Industrial School and Old Women's Buffalo Jump.

Willmore Wilderness Provincial Park adjoins Jasper National Park in the north and extends along the British Columbia border. Wilderness areas have been set aside to preserve as

far as possible the natural scene and are neither subject to development nor provided with roads. Two wilderness areas were established under the Forest Reserves Act in 1961. Willmore Wilderness Provincial Park has an area of 2,149 sq miles, Siffleur Wilderness 159 sq miles and White Goat Wilderness 489 sq miles. The Ghost River Wilderness area of 59 sq miles was established under the Provincial Parks Act in 1967. The wilderness areas are complemented by six natural areas established during 1968-70 in representative zones of the province: Kootenay Plains in the mountain region, 13 sq miles; Foothills, 160 acres; Parkland, 159.2 acres; Brown-Lowrey, 640 acres; Red Rock Coulee, 801 acres; and Plateau Mountain, 320 acres.

British Columbia. There are 294 (175 developed) provincial parks in British Columbia, having a total area of about 10,664 sq miles. These parks are classified as A, B and C. Class A parks are intended to preserve outstanding natural, scenic and historic features of the province for public recreation; they have a high degree of legislative protection against exploitation and alienation. Class B parks are also primarily for the protection of natural attractions but other resource use may be permitted if it does not unduly impair recreational values. Class C parks are intended primarily for the use of local residents and are usually managed by local park boards. Nature Conservancy Areas in any park are fully protected from resource development and are dedicated to a variety of recreational uses. There are immense wilderness areas such as Tweedsmuir Park and Wells Gray Park and outstanding scenic and mountain reserves such as Garibaldi, Mount Robson, Manning and Bowron Lake Parks. Mount Edziza Park and Recreation Area, established in 1972, is a wilderness area located in the northwest section of the province near historic Telegraph Creek. It contains outstanding examples of recent volcanic activity and covers 898 sq miles (509 sq miles Class A park, 389 sq miles recreation area). The formal gardens of Peace Arch Park are a monument to the goodwill between Canada and the United States. Vancouver Island has a chain of small forested parks that have achieved tremendous popularity with tourists; the best known are Little Qualicum Falls, Miracle Beach and Goldstream. The famous gold town of Barkerville was restored and became the first provincial historic park; Fort Steele in the East Kootenay area is also being restored to preserve another of British Columbia's pioneer settlements. Sixteen marine parks with mooring facilities and campgrounds have been developed on mainland inlets and coastal islands for the benefit of water-borne vacationers.

The popularity of British Columbia's parks, with their integrated campgrounds and picnic areas, is attested by the fact that about 7,840,000 park visits were recorded during 1972; about 18% of the visitors were campers and the remainder day visitors. Records show that Mount Seymour, Cultus Lake and Golden Ears Parks were the most widely used.

1.4.4 The National Capital Region

Canada's Capital lies in a magnificent natural setting, with its hub on the limestone bluff on the south shore of the Ottawa River below the Chaudière Falls. The original inhabitants in this area were the Algonquin Indians, who were driven out by the Iroquois in the middle of the 17th century. Champlain explored the Ottawa in 1613 and called it "la grande rivière des Algonquins". Early English traders called it the Grand River. "Ottawa" is the anglicized form of Outaouac or Outaouais, the name of the Indian tribe from Lake Huron which traded with the French in the 17th century. They carried their furs by this river. Explorers, fur-traders, missionaries and, during the 19th century, lumbermen and settlers travelled up and down the Ottawa River.

The first settlement in the region was founded by Philemon Wright, from Woburn, Massachusetts. Early in 1800 he led a small group of farmers and established a settlement in what is now Hull. He also brought in tradesmen and soon had a small self-sufficient community. Wright started the great Ottawa Valley timber trade by taking a raft to Quebec City in 1806, fortuitously meeting England's need for an alternative source of timber when Napoleon had closed the Baltic timber trade.

Settlement on the south shore of the river commenced in earnest about a generation later. The War of 1812 drew attention to the vulnerability of the line of communications along the St. Lawrence River linking Quebec City with the settlements in Upper Canada; a secure alternative route was needed. After many delays and studies, a new route to Kingston via the Ottawa River and Rideau and Cataraqui river systems was approved. Finally, in 1826, Lieutenant-Colonel John By of the Royal Engineers was sent to the Chaudière area to build a canal from that point to Kingston. By employed two companies of Royal Sappers and Miners

and a labour force, mainly Irish, of several thousand men to construct the canal. In 1823, the Earl of Dalhousie, Governor-in-Chief of British North America, had secured commanding ground for the Town. In 1827, By laid out two settlements, Upper Town and Lower Town, adjacent to this Crown land, at that time called Barrack Hill. The canal was completed in 1832 and Bytown began to grow and prosper. Stores, factories, banks, churches and schools appeared. Steamboats plied the river and canal. A newspaper, the *Bytown Gazette*, was started in 1836.

Bytown was now the inland centre of the squared timber trade and by 1850 could boast of some fine stone buildings, among them the home of Thomas MacKay which today forms the central part of the residence of the Governor General of Canada. A change then occurred in the timber industry; the British system of preferential import duties on squared white and red pine logs was abandoned and trade began to decline. However, by this time the accessible forest stands of the eastern United States were depleted and sawn lumber was needed to house a growing population. Also, the American railway and canal network had extended to the Canadian border making transportation easy. Encouraged by these favourable conditions American industrialists came to Bytown and established large sawmills by the Chaudière Falls. Soon the islands about the falls and the flats on both shores were covered with lumber piles and loaded barges were on their way to the American market. The lumber industry began its rise to dominating importance. At the beginning of 1855, Bytown became a city and took the name Ottawa.

The United Province of Canada, since its formation in 1841, had shuttled its capital between Kingston, Toronto, Montreal and Quebec and was now trying to agree on a permanent site. At the end of 1857, Queen Victoria settled the dispute by choosing Ottawa. Government buildings for the new capital were designed and contracts were let in 1859 for their construction. However, the cost was much greater than expected and it was not until 1866 that the government of the Province of Canada actually moved to Ottawa. The next year the first Parliament of the new Dominion of Canada met in an incomplete Parliament Building, situated on the former Barrack Hill.

The nation was prosperous during most of the next decade. Ottawa grew and the government expanded as the Dominion extended its authority over more and more of British North America. In 1871 the city had a population of about 22,000. Many fine homes and stores in stone and brick were built. The Departmental Buildings, flanking the Parliament Building on the Hill, were enlarged. An old wooden City Hall near the Rideau Canal was replaced in 1876 by a fine stone building and a large post office was erected at the city's centre. By the end of the century, Ottawa was a flourishing industrial centre with a population of 59,000. It remained the hub of the lumber industry of eastern Canada, had the largest paper mills in the country and the leading match factory in the world. However, little effort had been made to preserve or enhance its natural beauty until the Ottawa Improvement Commission was formed in 1899 and the Driveway along the Rideau Canal was begun. Progress was slow but in the years up to the beginning of World War I the city centre began to take on a new face. Many new government buildings were built — the Dominion Observatory and Geodetic Building at the Experimental Farm, the Archives Building, the Victoria Memorial Museum, the Royal Canadian Mint and the Connaught Building. In 1912, the Grand Trunk Railway completed construction of the Union Station and the Chateau Laurier. During this period several studies were made and plans recommended for the improvement of the National Capital, but these were deferred because of the War and for other reasons. Fire destroyed the Parliament Building in 1916, leaving standing only the Library now forming part of the magnificent building of neo-Gothic architecture which replaced it. The beautification of the Capital was continued by the Ottawa Improvement Commission until 1927, when it was replaced by the Federal District Commission. However, the first concrete step in the redevelopment of the National Capital took place in 1951 with the tabling of a comprehensive master plan for the National Capital Region. The plan, referred to as the "Gréber Plan", brought a solution to the many problems impeding the growth of the region and the National Capital Commission was formed in 1959 to carry out the recommendations.

Ottawa today, with its population of some 300,000, together with the city of Hull on the north side of the Ottawa River with its population of about 63,000, comprises the core of the National Capital Region, an area of about 1,800 sq miles in Ontario and Quebec. In lineal distance, the nearest extremity of the Region to Parliament Hill is 18 miles and the farthest is

35 miles. Within that area there are 57 municipalities and a total population of about 600,000. Industrial development in the Region is limited, a good proportion of the work force being employed by the federal government or associated with government functions.

Although the terms of reference of the National Capital Commission are "to prepare plans for and assist in the development, conservation and improvement of the National Capital Region in order that the nature and character of the seat of the Government of Canada may be in accordance with its national significance", it should be noted that the Commission does not have jurisdictional authority over any of the municipal or regional authorities or the two provincial governments concerned. Most matters affecting the municipalities — such as planning, zoning, land use, building density, public transit, parking and construction of streets, arterial roads and highways — are within their sole jurisdiction, subject only to provincial government approval, so that the National Capital Commission in its development efforts depends essentially upon the co-operation of each municipality and provincial government. As a result of this co-operation, the cities of Ottawa and Hull and their surrounding areas have, as a whole, become an efficient and aesthetically satisfying place in which to carry on the nation's business and a fitting symbol of Canada's cultural and linguistic values.

In recent years, the efforts of the Commission have focused on the development of a unified and lively core for the Capital. At a constitutional conference in Ottawa in 1969, the federal and provincial first ministers declared "the cities of Ottawa and Hull and their surrounding areas" to be the Canadian Capital Region. Almost immediately, work began to remove the longstanding economic disparity between Hull and Ottawa. Fifty-nine acres have been acquired in Hull for a federal building program to house various government departments. These 59 acres include 44 acquired in 1972 by the Commission from the E.B. Eddy Company. Within weeks of this acquisition, pulpwood piles and mills began to vanish from the landscape and a long-cherished goal came at least partially into view: an Ottawa - Hull necklace of park, promenade and rushing water encircling Parliament Hill. Also in 1972, work neared completion on the new Portage Bridge linking Ottawa and Hull and the new Airport Parkway from the airport to downtown Ottawa - Hull was officially opened.

The recreational amenities of the Region, and especially those in Ottawa and Hull, have been developed for people to use and enjoy. To the advantages of the well-known scenic driveways and large parks and playgrounds have recently been added the pleasures of a four-mile ice skating rink in winter and boating in summer along the Rideau Canal through the heart of Ottawa, maple sugar shanties, large garden allotments where families may hoe and chat in open air and sun, and 50 miles of looping bicycle paths winding past waterways and through pleasant wooded areas. Public concerts in the parks, walking tours, attractive pedestrian malls and museums are there for the participation of all Canadians and their visitors and the Region has become a centre of national significance in which all may have a sense of pride and possession.

1.5 Preservation of the environment

Over the past several years Canadians have become increasingly aware of the problems of environmental quality management. The deteriorating quality of Canada's waters, its air and its soils, the noise and congestion of urban life, and the exploitation of its mineral resources, its fisheries and forests and its wildlife became vitally important to many concerned and conscientious citizens. Man was clearly having a greater and greater impact on his natural environment and yet he had no definite idea of what the delicate ecosystem could bear in the way of man's intrusion. A range of problems relating to the wise use of the natural environment became one of the major issues of the late 1960s and promises to remain so through the rest of the century. Obviously, an issue of this magnitude required an immediate response from all governments in Canada. It was vital to develop a consistent philosophy regarding man's place in the Canadian and world environments and to develop a series of policies that could give effect to this philosophy.

The goals of the federal government in this respect are, on the one hand, to ensure that all Canadians have access to a style of life befitting a nation rich in natural resources and, on the other hand, to safeguard these natural resources for future use by the present generation and the generations to follow. To this end, the Department of the Environment has been established to help ensure the protection, preservation and enhancement of Canada's environment while encouraging efficient use of its natural resources.

The Department is concerned primarily with renewable resources — air, water, fish, forests and wildlife. Its research, planning and management programs are directed toward incorporating environmental design into resource management processes. How many salmon can be taken from the Fraser River without jeopardizing future generations of fish? How much effluent can be discharged safely into a river? How rigidly can sanctions be employed against polluters without causing adverse economic consequences in an area? These are examples of the extremely difficult questions that need to be faced, and different answers apply in different cases.

1.5.1 Federal programs

1.5.1.1 The federal Department of the Environment

The federal Department of the Environment was established by the Government Reorganization Act, 1970 (SC 1970-71, c.42) which received Royal Assent on June 10, 1971. The general goals of the Department are as follows: to maintain the capacity to meet historical and statutory responsibilities for research and management of air, water, fish, forest and wildlife resources; to clean up and control pollution; to assess and control the environmental impact of major new programs, projects and developments; to improve the understanding of long-term environmental phenomena; to promote and support international environmental initiatives; and to create a better public awareness and understanding of environmental issues.

Since almost all of these goals involve co-operation and co-ordination with other departments and with other governments both in Canada and internationally, the Department of the Environment is engaged in a co-operative endeavour in which it acts both to carry out programs of its own and to catalyze programs of others in order to improve the Canadian environment.

The Department was originally organized in seven "Services", each with responsibility for some particular area of departmental programs. In December 1972 the Department was reorganized to reduce the number from seven to five under two principal components, Fisheries and Marine Service, and Environmental Services, each headed by a Senior Assistant Deputy Minister. The following new organization came into effect January 1, 1973.

The Fisheries and Marine Service is responsible for fisheries research, fisheries development, fishing operations on both coasts and on inland waters, the administration of Canada's role in international fisheries and the Fisheries Prices Support Board, also all ocean-oriented activities which include oceanography and hydrography, as well as the administration of small craft harbours. The Chairman of the Fisheries Research Board functions closely with the Senior Assistant Deputy Minister, Fisheries and Marine, though he reports through the Deputy Minister.

The second component comprises three Environmental Services and Planning and Finance.

The Environmental Management Service has nation-wide responsibilities related to forests, inland waters, wildlife, lands, and major environmental effects studies; these responsibilities are discharged by four Directorates. The Canadian Forestry Service is responsible for forestry and forest products research, consultative services, and forest management services on federal lands. The Inland Waters Directorate plans for and manages national inland water research and data network programs, including hydrometric surveys, and co-operative federal-provincial programs for water resource management. The Canadian Wildlife Service is responsible for the conservation and management of migratory birds, wildlife habitat acquisition and management, wildlife research, and consultative services. The Lands Directorate is responsible for land classification, land inventory, and land use study and planning.

The Atmospheric Environment Service is responsible for planning, establishing and operating air-quality networks and surveys, for providing an information service on the state of the atmosphere and trends in its quality, for collecting and analyzing weather data and ice-movement data, for atmospheric research, for air and noise pollution research and finally for weather forecasting.

The Environmental Protection Service takes action to prevent or combat environmental problems for which the Department has responsibility, including pollution control in water and air, solid wastes management and control and disposal of environmental contaminants. It

is responsible for the control of activities having an ecological impact, for noise control, for the operation of an emergency pollution centre, and for environmental protection related to federal activities and facilities.

The Planning and Finance Service provides an over-all framework of policy and planning advice; co-ordinates the government's relationships respecting environmental and resource matters with the provinces and other countries; develops and co-ordinates a comprehensive approach to departmental science policy and research activities; supports the over-all departmental program by assisting in the acquisition and deployment of the human, physical and financial resources required for the efficient and effective fulfillment of departmental objectives.

1.5.1.2 Federal legislation

A large number of Acts that are important in renewable resources and environmental quality management are already on the statute books. Major pieces of legislation and the responsible department include the following:

The Department of the Environment: The Fisheries Act (RSC 1970, c.F-12, amended 1970); The Canada Water Act (and phosphate regulations) (SC 1969-70, c.52); The Migratory Birds Convention Act (RSC 1970, c.M-12); The International River Improvements Act (RSC 1970, c.I-22); The Game Export Act (RSC 1970, c.G-1); The Fisheries Development Act (RSC 1970, c.F-21); The Clean Air Act (SC 1970-71, c.47); The Forestry Development and Research Act (RSC 1970, c.F-30).

The Ministry of Transport: The Navigable Waters Protection Act (RSC 1970, c.N-19); The Canada Shipping Act (RSC 1952, c.29, amended 1971); The National Harbours Board Act (RSC 1970, c.N-8); The St. Lawrence Seaway Authority Act (RSC 1970, c.S-1); The Motor Vehicle Safety Act (SC 1969-70, c.30).

The Department of Indian Affairs and Northern Development: The Arctic Waters Pollution Prevention Act (SC 1969-70, c.47); The Northern Inland Waters Act (SC 1969-70, c.66); The National Parks Act (RSC 1970, c.N-13); The Dominion Water Power Act (RSC 1970, c.W-6).

The Department of Regional Economic Expansion: The Prairie Farm Rehabilitation Act (RSC 1970, c.P-17); The Fund for Rural Economic Development Act (SC 1966-67, c.41).

The Department of Energy, Mines and Resources: The Atlantic Provinces Power Development Act (RSC 1970, c.A-17); The National Energy Board Act (RSC 1970, c.N-6); The Resources and Technical Surveys Act (RSC 1970, c.R-7).

The Department of Veterans Affairs: The Veterans Land Act (RSC 1970, c.V-4).

As the list indicates, not all federal agencies dealing with environmental and renewable resource matters have been brought together in the new Department of the Environment. For example, the Department of Energy, Mines and Resources with its responsibilities for the Geological Survey of Canada and the Fuels Combustion Research Centre provides an important contribution to the environmental and renewable resource field; the Department of Agriculture carries out environmental research and administers the Canada Committee on Pesticide Use in Agriculture; the Department of Indian Affairs and Northern Development is significantly involved in environmental and renewable resource activities through its responsibilities for northern development and for the national and historic parks. Other departments having responsibilities in this area include: the Department of Regional Economic Expansion; the Department of Finance which funds resource programs and promotes economic development; the Ministry of Transport which administers the Canada Shipping Act containing legislation respecting the prevention of marine pollution; the Department of External Affairs which is responsible for co-ordinating international relations and environmental and resource issues of a multinational nature; and the Ministry of State for Urban Affairs which is responsible for promoting research into urban environmental problems. Indeed, all departments of government are concerned with the impact of their activities upon the environment.

In addition, there are Crown corporations, boards, and quasi-governmental organizations with an interest in resource development and the environment; these include the Northern Canada Power Commission, the Northern Transportation Company, the National Harbours

Board and the St. Lawrence Seaway Authority. The Central Mortgage and Housing Corporation provides funds for municipal sewage treatment facilities. Other agencies, such as the National Research Council, award grants-in-aid of research into resources and environmental problems.

1.5.2 Federal-provincial programs

Jurisdiction over some natural resources, such as water, is shared by the federal and provincial governments. In other instances where jurisdiction rests with one level of government, such as the federal responsibility for fisheries and provincial responsibility for forests, management practices for one resource may affect the management of others. Consequently, many of the federal government's environmental programs are carried out in co-operation with the provinces.

For water resources there are only two areas in which jurisdiction is not shared — the northern territories, and the sea and sea-bed beyond the recognized boundaries of the coastal provinces and out to the limits established by national claim and international convention. Within the boundaries of the provinces, however, both the federal and provincial governments possess significant, and sometimes overlapping, responsibilities.

Given the fact of divided jurisdiction, integrated water management requires institutional arrangements within which all jurisdictions, competences and capabilities can be brought together for joint goal-setting, planning and operation. These arrangements include consultative committees, set up with each province, to develop improved understanding of mutual problems and to advise governments on priorities for joint action. Consultative committee discussions pave the way for federal-provincial agreements to study particular river basins. For example, the Qu'Appelle Basin Study Agreement signed in August 1970 was a joint undertaking by the federal government and Saskatchewan and Manitoba to prepare a plan to guide the future development and management of the water and related land resources of the basin. Similarly, the preparatory work for the Saint John River Basin Agreement between Canada and New Brunswick, now in its third year under authority of the Canada Water Act, was facilitated by the Canada - New Brunswick Consultative Committee. When public controversy arose in 1970 over the reduced water levels in the Peace-Athabasca Delta, the Canada - Alberta Consultative Committee was used to provide a preliminary overview of the situation. A joint study was subsequently launched to determine possible remedial measures. It is anticipated that more integrated water management programs jointly undertaken by the provincial and federal governments will be agreed to throughout Canada; the Churchill River Basin is one such program that is envisaged for 1973.

Some other examples of established federal-provincial co-operative arrangements on the subject of water include the Prairie Provinces Water Board which apportions water among the three provinces, the Fraser River Joint Advisory Board which advises on a program to reduce the flood threat to the Fraser River Basin, and the Saskatchewan-Nelson River Basin Board which completed a major water supply study in 1972. There are joint federal-provincial arrangements for the protection and use of other renewable resources as well.

Current programs of major importance can be cited to exemplify the federal government's concern for the environment. On August 31, 1970, a major integrated management study agreement was signed by the governments of Canada and Manitoba. The purpose of the agreement is to determine the environmental effects of changing the levels of Lake Winnipeg and the stream flows in the Churchill and Nelson river systems caused by the development of the hydro-electric potential of north-central Manitoba. Another such program, undertaken in co-operation with Québec, is an assessment of potential environmental impact associated with a large hydro-electric and other resource development proposal for the watersheds of southern James Bay. The potential environmental impact of the construction and operation of a major oil or gas pipeline and support facilities from the Arctic to central Canada is being assessed. Results of these study programs will be incorporated into the design of the development projects.

Co-operative research programs have been developed with industry and other organizations to reduce water pollution from pulp and paper mills. Recipients of contracts were: the Pulp and Paper Research Institute, Pointe Claire, Que.; the BC Research Council, Vancouver, BC; Domtar Limited, Cornwall, Ont.; MacMillan Bloedel Research Limited, Vancouver, BC; and the Research and Productivity Council of New Brunswick, Fredericton.

1.5.3 International programs

Canada must co-operate with other countries in order to make progress toward many important environmental and resource objectives. The following are some of the international bodies concerned with environmental and resource matters in which Canada participates.

The *International Joint Commission* assists Canada and the United States in carrying out the provisions of the Boundary Waters Treaty of 1909. It consists of six Commissioners, three appointed by the President of the United States and the other three by the Government of Canada. The Treaty requires that projects for the use, obstruction, and diversion of boundary waters and, in certain instances, of rivers crossing the International Boundary, must be approved by the Commission.

In addition, the Commission is requested by the governments of the two countries to investigate and report on other matters of concern along the common border. In recent years the Commission has received a number of requests to investigate and report on air and water pollution problems. Much of its work is done under the aegis of advisory boards of various types, usually charged with specific area or functional responsibilities. They report to the Commission which drafts the final reports and recommends appropriate action.

Following several years of research carried out by its advisory boards for Lake Erie and for Lake Ontario - International St. Lawrence River, the Commission issued its final report on pollution in the Lower Great Lakes and the international section of the St. Lawrence River in 1971. This report led to the conclusion of a Canada - US Agreement on Great Lakes Water Quality which was signed in Ottawa in April 1972 by Prime Minister Trudeau and President Nixon. The Agreement contains a series of water quality objectives which both countries agree to attain within specified time limits, by implementing programs to control the input of pollution into the Great Lakes. Under the terms, the International Joint Commission will monitor the progress in each country toward fulfilling the Agreement. In addition, the Commission has been requested to undertake two major studies, one concerned with pollution in the Upper Great Lakes and the other with pollution of the Lakes from land sources and agriculture.

During 1972, the Commission issued its final report on transboundary air pollution in the Detroit and St. Clair River areas. Meetings between the two federal governments, the province of Ontario and the state of Michigan were held to examine and to seek ways of implementing the IJC's recommendations for the abatement of air pollution in the area.

In that same year work continued on a number of other water matters along the Canada - US boundary. As its name implies, the IJC International Great Lakes Levels Board is concerned with water levels in the Great Lakes as a whole. Its International St. Lawrence Board of Control deals with water levels in Lake Ontario and the regulation of outflow from the lake. The St. Croix Board is concerned with water levels and supervision of dam construction in the St. Croix River. The Lake of the Woods Board, the Lake Superior Board, the Rainy Lake Board, and the Kootenay Board, are concerned with water levels in these lakes and rivers. The Souris River Board is responsible for allocation of water in that river. The Niagara Board deals with water levels in Grass Island Pool, and the operation of the Lake Erie ice boom. The International Joint Commission has an interest in the measurement and apportionment of water in the St. Mary and Milk rivers. Also reporting to the International Joint Commission are international engineering boards for the Saint John, the St. Croix, the Souris, and the Red rivers. An IJC Technical Advisory Board on Air Pollution is concerned with the occurrence of air pollution anywhere along the International Boundary. There is an IJC Advisory Board for Pollution Control in the St. Croix River and another for the Red River.

Canada is a member of nine international fisheries commissions, as well as the *International Council of Exploration of the Sea*. The latter, composed of Belgium, Canada, Denmark, Finland, France, Germany, Iceland, Ireland, Italy, the Netherlands, Norway, Poland, Portugal, Spain, Sweden, the USSR and the UK, encourages and co-ordinates studies of the marine environment with particular reference to the living resources of the sea, primarily in the north Atlantic area. The international fisheries commissions, established under the terms of formal Conventions, assume responsibility for the investigation of specific living marine resources in defined areas, in order to further rationalize development and conservation of fisheries of common concern to member states. These commissions are: the *International Pacific Halibut Commission*, the *International Pacific Salmon Fisheries*

Commission, the International North Pacific Fisheries Commission for the High Seas, the North Pacific Fur Seals Commission, the International Commission for the Northwest Atlantic Fisheries, the Great Lakes Fisheries Commission, the International Whaling Commission, the Inter-American Tropical Tuna Commission and the International Commission for the Conservation of Atlantic Tuna.

Canada is taking part in the *International Hydrological Decade* (January 1, 1965 - December 31, 1974), with participation by 108 countries, which was set up under UNESCO auspices to facilitate a better understanding of hydrological phenomena to allow prediction of the results of development of water resources, in the interests of better management. The National Co-ordinating Committee is composed of representatives from federal, provincial, university and specialized agencies. Canada is a member of the international working groups on the water balance, representative and experimental basins, and hydrological problems related to water quality; there are International Hydrological Decade Committees in eight provinces.

Canada is also involved in the *International Field Year for the Great Lakes (IFYGL)*, established within the framework of the International Hydrological Decade. The period of intensive field activity is April 1, 1972 - March 31, 1973, to be followed by organization and reporting of data to the end of 1974. The IFYGL is an intensive study of the Lake Ontario basin involving a large number of Canadian and United States federal, provincial and state agencies and universities; a steering committee guides the planning program. This study will involve the examination of problems associated with the geology, limnology, hydrology, meteorology, biology and chemistry of the lake and its basin.

The *Canadian National Committee for Geography* of the *International Geographical Union* was responsible for the establishment of the organizing committee to host the 22nd International Geographical Congress in 1972. The Union was established to further international co-operation in the field of geography. The Congress is held every four years to bring all members together to study various problems relating to global aspects of geography. The secretariat of the Canadian committee is located in the Department of the Environment.

The *International Commission on Irrigation and Drainage*, of which Canada is a member, meets every three years to pool world knowledge on specific current problems in irrigation, drainage and flood-control engineering.

Canada is a member of the NATO-sponsored *Committee on the Challenges of Modern Society (CCMS)*. The Committee's main purpose is to consider specific problems of the human environment with the deliberate objective of stimulating action by member governments. To this end pilot projects on a number of subjects are being carried out under the aegis of the CCMS. Canada is involved in pilot projects on disaster assistance, road safety, pollution of coastal and inland waters, waste-water treatment, and advanced health care.

The *Organization for Economic Co-operation and Development* established an *Environment Committee* which includes Canada among its members. A number of Sector Groups were set up to accomplish the objectives of the Committee in various fields of environmental problems. The Urban Environment Group will suggest measures to reduce pollution levels and attempt to improve management practices relating to the protection and improvement of the urban environment. The Unintended Occurrence of Toxic Chemicals Group will look into the possibility of reducing the number of occurrences of toxic chemicals being introduced into the environment, and the relative costs and effects of the various methods utilized. The Air Quality Group will investigate and define problems of air pollution and suggest policies and actions for pollution control and air-quality maintenance as well as means by which governments may implement those policies. The Water Management Group will investigate and define the problems of managing water resources and suggest measures for the improvement and preservation of water quality by various management methods and the socio-economic effects of such schemes. The Steering Group on Eutrophication, a sub-group of water management, will oversee a series of studies to assess the costs of controlling the discharges of detergents, fertilizers and agricultural wastes into waterways.

In addition, Canada will work toward elucidation of a set of guidelines on the economic aspects of environmental policies at the international level, the development of realistic pollution control cost data and the reasonable and measured application of the 'polluter pays' principle. Several ad hoc Groups were established to undertake short-term investigations into

the following problem areas: impact of the motor vehicle; pollution by the pulp and paper industry; air pollution from fuel combustion in stationary sources; and environmental degradation from mediterranean development.

A Canadian national committee has been established which is responsible for the co-ordination and implementation of all *International Biological Program* projects in which Canada has active participation.

Canada played a prominent role in the *United Nations Conference on the Human Environment* held in Stockholm, June 5-16, 1972. The Canadian delegation, with representatives from the provinces and from industry, helped to frame many important resolutions and to ensure that recommendations important to Canada were embodied in the final United Nations Action Plan. Canada also provided a major impetus to the preparation of the "Declaration of the United Nations on the Human Environment"; the 26 principles of the Declaration were agreed to by all participating countries. A United Nations Governing Council on Environmental Programs was established to oversee the implementation of the Action Plan. A secretariat, headed by Mr. Maurice Strong of Canada, has been established at Nairobi to serve this Council.

The Stockholm Conference also resulted in Canada's participation in a number of conferences designed to reply to international environmental concerns; while, on the national scene, a federal-provincial task force has been formed to draw up a National Action Plan flexible enough to permit a co-operative and co-ordinated approach to national environmental issues by the federal and provincial governments and, at the same time, provide an appropriate response to the recommendations of the United Nations Action Plan.

Canada plays an active role in the *Inter-Governmental Maritime Consultative Organization* (IMCO), a specialized agency of the United Nations concerned mainly with maritime affairs. It is also a member of the Assembly or plenary body and of the Council (the 18-member governing body) as well as of the Maritime Safety Committee. This latter includes the sub-committee on marine pollution on which Canada is also represented. IMCO will sponsor an international conference on marine pollution in 1973 to draft an international agreement placing restraints on intentional contamination of the sea, land and air by ships and other equipment operating in the marine environment.

The *International Convention on Dumping of Wastes at Sea*, formulated in accordance with a recommendation of the Stockholm Conference, and concluded and opened for signature on December 29, 1972, has already been signed by this country.

Canada is engaged in preparations for the *UN World Population Conference* to be held in 1974.

Canada, with the world's longest coastline (which borders on three oceans), is deeply involved in intensive preparations for the *1973 Law of the Sea Conference*. The preservation of the marine environment in all its aspects is of the utmost concern to this country, and it can only be effected by an elaboration of international controls on the legitimate uses of the sea and hence the development of international environmental law, fully cognizant of the rights of coastal states.

Several monitoring programs sponsored by one or more of the United Nations specialized agencies receive Canadian support. All monitoring programs, such as those employed by Canada to monitor foods and man for residue build-up, submit their results to the Food and Agriculture Organization and the World Health Organization. Canada is a member of the World Weather Watch which forecasts weather patterns, etc., as well as of the Background Air Pollution Network which is responsible for the monitoring of atmospheric variables. The ten stations in this network which Canada has established fulfil our commitment under the UN Earthwatch Program. The Environmental Protection Service of the Department of the Environment, in co-operation with the provincial governments, monitors air quality in a number of Canadian cities and the results of this program are forwarded to the World Health Organization. This country also participates in the Working Group for the Integrated Global Ocean Station System (IGOSS) and the Group of Experts on the Scientific Aspects of Marine Pollution (GESAMP); the administrative secretariat of GESAMP is provided by IMCO. Canada is also a member of the International Atomic Energy Agency (IAEA) which monitors the oceans and the atmosphere with regard to the level of radioactivity present and the amount of radioactive substances in these two spheres.

Canada has water-quality monitoring and surveillance programs on lakes, rivers and streams crossing the International Boundary, some of which are conducted under the auspices of the International Joint Commission. Canada is a member of the *UN Committee on the Peaceful Uses of the Sea-Bed and the Ocean Floor*, concerned with questions relating to marine pollution caused by the exploration and exploitation of marine mineral resources beyond the limits of national jurisdiction. The Committee has sought proposals for the establishment of an international body to regulate the exploitation of the sea-bed.

UNESCO has developed a program entitled *Man and the Biosphere (MAB)* which will seek to develop the scientific basis for the rational use and conservation of the resources of the biosphere; two committees, the Inter-departmental Committee for MAB and the Canadian Committee for MAB, will co-ordinate all aspects of this program. Canada has also been re-elected to a second term on the *International Coordinating Council* with representatives from 24 other member states and representatives from the United Nations Food and Agriculture Organization, World Meteorological Organization, International Committee for Scientific Unions, and International Union for the Conservation of Nature and Natural Resources.

Chapter 2

History

It is 50 years since the *Canada Year Book* included a chapter on Canadian history and it seemed appropriate to inaugurate the new format with a review of the historical background to the events recorded elsewhere in the book.

The first part of the chapter describes the present knowledge of Canada's earliest inhabitants. The second covers the early explorations which opened up the country to European colonization. The third section sketches the political and economic evolution and the fourth part discusses the events of this century.

2.1 Canada before Cartier

The following outline of Canada's prehistory updates an article on Canadian archaeology that appeared in the *1968 Canada Year Book*. Since archaeology is a cumulative discipline such periodic revisions are necessary. Future research will undoubtedly modify many aspects of the present outline but the very fact that a revision is needed reflects the increasing pace and quality of archaeological research in Canada. For a history of this archaeological research the reader is referred to the original article.

2.1.1 Prehistory of eastern Canada

Eastern Canada, consisting of Ontario, Quebec and the Atlantic Provinces south of the treeline, can be roughly divided into two major archaeological areas — Northern and Southern. Physiographically, the Northern Area coincides with the Canadian Shield and the predominantly coniferous forests that cover northern Ontario, most of Quebec, and Newfoundland. The Southern Area incorporates southern Ontario, the Eastern Townships, the upper St. Lawrence Valley of Quebec, and the Maritime Provinces, an area of predominantly hardwood forests.

There is clear evidence that the faunal and floral resources of the Southern Area were able to support a far greater prehistoric population than the less kindly endowed Northern Area. The richer archaeology of the south, however, has been complicated by the development of local cultural groups which interacted with each other and with outside areas in a highly complex fashion. Conversely, the Northern Area is characterized by a high degree of cultural similarity which allows certain general interpretations to be drawn from relatively limited archaeological data. In both areas, the maritime-adapted cultures differed significantly from contemporaneous interior cultures. Indeed, along the southern and eastern coastal regions of the Northern Area, Indian and Eskimo cultures replaced one another on more than one occasion as major climatic changes favoured the maritime-adaptive patterns of one group over the other.

The earliest evidence of man in eastern Canada dates between 10,000 and 11,000 years ago. During this period, small bands of hunters roamed the Southern Area near the edge of the glacier which covered the north. These people, referred to as the Clovis culture, were part of an extensive but thinly distributed population which entered the New World from Asia and rapidly occupied most of North America.

In western North America, the Clovis culture became differentiated into a number of regional complexes, collectively termed Plano. The Plano people, like their Clovis ancestors, were big-game hunters. Eastward penetration by Plano peoples seems limited to the Southern Area of Ontario and the southern fringe of the Northern Area of the same province which was still partially covered by glacial ice and associated glacial lakes 8,000 to 9,000 years ago. Although the data are very incomplete, it appears that the earlier Clovis population in the east evolved into various regional complexes called Archaic. Early representatives of the Archaic cultures, therefore, already occupied most of eastern Canada before the eastward movement of the Plano people began. Indeed, a number of sites have produced associated early Archaic and Plano artifacts indicating that the two populations were, on occasion, in direct contact with one another.

Through a process of gradual change, the Archaic population of the Southern Area became more diversified with numerous local varieties of culture developing in a number of different directions. There is evidence that by 3500 B.C., polished stone tools such as adzes and

finely ground slate dart heads were used as they are found for the first time along with a wide range of flaked stone implements and bone artifacts. Associated with this complex was an elaborate burial cult involving the use of red ochre and grave offerings. The subsistence pattern of the Archaic populations became more diversified than the preceding pattern of the Clovis and Plano hunters. Although big game was still of primary importance, a significant portion of the diet stemmed from smaller animals, fish and wild vegetable foods. In the Northern Area, a variety of Archaic, termed the Shield Archaic, was apparently developing in a parallel fashion. This northern variant, with its large knives, scraping implements, distinctive dart heads, and general absence of polished stone tools, drifted eastward following the caribou who were then reoccupying the territory vacated by the retreat of the continental ice sheet.

Contrary to the regional variations seen in the Archaic of the south, the northern culture exhibits amazing similarity over enormous tracts of land. An exception to this occurs in the Atlantic coastal region and Newfoundland where a distinctive maritime-adapted population developed early in the 3rd millennium B.C. The material culture of these coastal peoples shares some similarities with Archaic groups of the Southern Area. However, considerable future archaeological research is yet required to determine the full extent of this relationship.

In the Southern Area, about 3,000 years ago, a number of changes took place among the Archaic peoples, marking the beginning of what is known as the Woodland period, the most notable being the introduction of a ceramic technology. Stylistic changes can also be seen in the flaked stone tool inventories. Burial practices became even more elaborate; burial mounds, exotic trade materials and elaborately decorated artifacts are typically associated with these burials. The subsistence base for the early stages of this period remained essentially unchanged. In the western portions of the Northern Area, ceramics appeared approximately 300 to 400 years later. To the east, among the Algonkian-speaking peoples of northern Quebec and Labrador, the basic Archaic way of life continued with only minor Woodland influence.

During the Woodland period, the gradual development and evolution of many of the historic native populations can be traced in the archaeological record. The events which led to the historic Huron, Petun, Neutral and St. Lawrence Iroquois are relatively well known. It is generally accepted that the ancestry of these peoples represents an indigenous development, rather than extensive migrations of peoples from other areas. One of the most significant factors influencing the development of the Iroquois was the acquisition of corn, introduced from the south between 500 and 800 A.D. This change in the subsistence base had a gradual, yet profound effect on the settlement pattern and social life of these people. Villages grew as great numbers could be supported by an increased food supply. Daily life became increasingly

Rock paintings are widely distributed throughout the Shield country of Ontario, Manitoba, and Saskatchewan. They were still being produced during the historic period and are believed to be associated with certain religious rites. This particular painting is located near the city of Thunder Bay, Ontario. (*Archaeological Survey of Canada*)

sedentary as more emphasis was placed on plant crops as a food source. Population pressures contributed to greater rivalry between tribal groups or villages, evidenced by the appearance of palisaded villages prior to 1000 A.D. Before 1450 A.D. cultivated beans were acquired, and squash and sunflower seeds appear even earlier, providing additional food sources to this largely sedentary existence.

In the Northern Area during the Woodland period the development that led to the historic Ojibwa, Algonkin, Cree and Montagnais is not characterized by a similar change in the subsistence pattern as with the Iroquois. This is also true of the ancestral Micmac, Malecite and other maritime populations. In these areas the social and economic system was adapted to the surrounding natural environment and does not appear to have changed significantly from earliest times.

2.1.2 Prehistory of western Canada

Western Canada, as described here, is the area lying west of Ontario and south of the Yukon and Northwest Territories. It is an area of extremely varied topography, climate and natural resources, features that strongly affected the distribution and density of the aboriginal population.

The date of man's first arrival in the area, coming from northeast Asia via the Bering Strait, remains uncertain. The crucial factors include the chronology of the advances and recessions of the Cordilleran and Continental glaciations and the question of the extent and duration of the Bering Strait land bridge — matters still in dispute. Human occupation has been documented to the south within the period of the last major glacial advance, indicating penetration of western Canada at some earlier date. However, evidence for such earlier movements is still under study and cannot be summarized at the present time. The oldest recognized cultures date no earlier than 9,000 to 11,000 years ago.

These cultures are represented by surface finds of projectile points of styles attributed to early big-game hunters elsewhere in North America. These are relatively large lanceolate forms characterized by longitudinal fluting, and probably used as points for spears or darts. Two major styles, an earlier Clovis and a later Folsom form are differentiated in terms of degree of fluting and other attributes. Where found to the south of what is now Canada, the earlier type is often associated with kill-sites of mammoth and mastodon, and the latter with various kinds of extinct bison. In western Canada, these point types are reported only from the southern part of the prairie area, suggesting that perhaps these cultures were replaced by later ones before the northern part of the prairie region was inhabitable. On the other hand, fluted points have been found far to the northwest, in unglaciated parts of Alaska; their absence from the intervening area would seem to indicate that they may have been destroyed by subsequent glacial action.

The succeeding complexes, generally dated from about 8000 to 5000 B.C., are characterized by lanceolate points lacking flutes and exhibiting a fine parallel flaking technique. They derived directly from the earlier point styles and are part of what is called the Plano tradition. Big-game hunting continued to be the basis of the economy, but the number and distribution of the finds indicate an increase in population and an expansion northward into areas not previously occupied.

Perhaps contemporary with the early big-game hunters of the prairies was a complex characterized by the occurrence of bipointed, leaf-shaped projectile points. The centre for this complex was in British Columbia, but similar points have been reported from the north. Radiocarbon dates indicate a relatively early occupation of one site in the Fraser River canyon. However, it has been questioned whether all points of this relatively simple form necessarily represent a single cultural group or time period. In any case, the evidence from Fraser Canyon indicates a quite different economy from that east of the mountains, one in which dependence on salmon fishing already prevailed even at this early date.

In the succeeding period, lasting from approximately 3000 B.C. to about 1 A.D., a number of changes are noticeable. One is an increase in tempo, with alterations in artifact styles, particularly projectile points, following one another in more rapid succession than previously. Another is an apparent increase in the variety of food resources exploited, although this may reflect inadequate knowledge of the food economy of earlier times. Several local cultural variants now become recognizable, but the geographic distribution of certain artifact types indicates considerable contact between these different cultural groups.

Restoration of a Chilcotin semi-subterranean house structure in Anahim Lake, British Columbia plateau. The restoration is based upon archaeological and historical evidence. In the illustration the framework has been completed and sod will be used to cover the entire outside of the house. These dwellings were entered through the roof. (*Archaeological Survey of Canada*)

In the prairie region, the earlier lanceolate projectile points were gradually replaced by smaller stemmed points with indented bases. The change apparently represented an evolutionary sequence, rather than a series of sharp breaks. Contemporary with the earlier part of this sequence were large side-notched points from southern Alberta, Saskatchewan and Manitoba, which show affiliations with points from bison kill-sites and campsites in Nebraska and western Iowa. In fact, the many resemblances to what is known as the Archaic in the eastern United States and Canada suggest that people from the east were moving into the prairie area with the improvement of the climate. Although bison seem to have remained the major food source, there is now evidence of the hunting of birds and small animals and the collecting of shell fish and other foods. A number of these southern hunters also spread into the Boreal Forest sections of the Prairie Provinces and even farther north.

In the plateau of British Columbia, available evidence indicates a continuation of the pattern associated with dependence on salmon fishing. There is evidence of the diffusion of northern technologies into the area and for the first time semi-subterranean house structures appear. That the region was not isolated from the country east of the mountains is confirmed by the discovery in the plateau of projectile point types like those of the prairies and the finding of plateau artifact types in Alberta. During this period on the coast of British Columbia, a rapid adaptation to the inter-tidal resources and to the salmon migration took place. This is evidenced by a shift from a hunting technology to a fishing technology featuring an assortment of bone implements. This basic technology maintained itself throughout the whole west coast cultural development.

From approximately 1 A.D. to the beginning of historic times, further development in the prairie area centred around a dramatic increase in the importance of bison hunting. This shift followed the general adoption of the use of buffalo jumps, a hunting technique which

consisted of driving the animals over cliffs or steep declines, where they were slaughtered by hunters waiting below. Concomitant with the increasing use of this technique was a continued diminution in the size of projectile points, culminating in the appearance of small, triangular notched forms used as tips for arrows rather than for darts.

Another innovation of this period was the introduction of pottery-making. Occurring only sporadically in the early part of the period, ceramics gradually increased in importance, both in the prairie area and in the Boreal Forest. Some of the wares show close relationships to the pottery of the woodland region of Minnesota and of the middle Missouri area of North Dakota, while others occur in Canada only and are of northeastern origin. In southern Alberta an earth-lodge village clearly derived from those of the Missouri valley indicates the spread of new people into the area. North of the prairie region, mixed economies continued to prevail, generally consisting of the hunting of a variety of mammals and birds as well as fishing. Continuing relationships with the south are suggested by the appearance of small arrow points typical of the prairies, reaching as far as the southwest Yukon.

In coastal British Columbia, the way of life based on salmon fishing continued to develop. The major technological change occurred around the beginning of the Christian era with the introduction of heavy woodworking tools of pecked and ground stone. In the interior plateau country small side-notched points made their appearance at about the middle of this period, gradually replacing earlier forms, and indicating the continuation of contact with the area east of the Rockies. Also at this time, based on evidence from the Yukon, Northwest Territories, and British Columbia, the Athabaskan language stock, the most important family in the northern area, appears to have spread to its present limits.

Trade goods finally began to appear in the archaeological sites of western Canada, ushering in the historic period. At this point identifications of archaeological complexes with historic tribes such as the Chilcotin, Carrier, Hidatsa and Blackfoot, are often possible. Such attempts are made difficult by the large-scale displacement of one group by another which resulted from the introduction of the fur trade and the use of fire-arms and, in the prairie area, of the horse. Nevertheless, the assignment of archaeological sites to such widely separated groups as the Salish and the Cree proceeds with growing confidence as excavation continues.

2.1.3 Prehistory of northern Canada

Northern Canada, as discussed here, refers to the Yukon Territory and the Northwest Territories including the Arctic archipelago. It is an area of great physiographic complexity, and the prehistory of its Indian and Eskimo occupants is equally complex. The rich sea mammal and fish resource, as well as the caribou, attracted prehistoric man into some of the most inhospitable regions of North America. Climatic fluctuations through time, that markedly affected the availability of both sea and land mammals, had a concomitant effect upon man who relied on them for food, clothing, shelter, and indeed for much of the material culture that permitted survival.

The earliest evidence of man thus far found in the New World comes from the northern Yukon Territory where, 25,000 to 30,000 years ago, hunters preyed on such animals as mammoth, horse, bison and caribou. These early hunters must have come from Siberia across the broad plain that connected Asia and North America at that time and penetrated through the interior of Alaska into the large portion of the Yukon that was free of ice during the last continental and mountain glaciation that covered the rest of Canada. Early man may have passed southward through a gap between the continental and mountain glaciers but subsequent re-advances of the ice have destroyed all traces of his passage. During the waning of the last ice sheets, bands of hunters possessing a distinctive stone tool kit including fluted spear points rapidly expanded to occupy most of the unglaciated portions of North America. These big-game hunters of ultimate Asiatic origin have been called Clovis. In southwestern Yukon and western Mackenzie District a sequence of cultural complexes can be tentatively traced from around 8,500 years ago to recent times. The evidence of palaeoecology and archaeology suggests that large herds of grazing animals such as caribou, bison and musk-ox, as well as smaller animals, were hunted on the open tundra-taiga until the area was forested 4,000 years ago.

Culturally, these people were related to their western neighbours in Alaska but all were influenced by groups of southern big-game hunters referred to as Plano. There is also evidence that northern technologies and ideas spread southward into the British Columbia plateau. The

Plano culture which evolved on the high plains drifted northward around 8,000 years ago to exploit the caribou and bison herds that were gradually occupying the territory being released by the continental glacier. In Keewatin District the Plano culture retained a relatively pure form but further to the west it appears to have intermingled with indigenous northern cultures. In the southern half of Keewatin District and southeast Mackenzie District the descendants of the Plano caribou hunters were forced out of the area around 1500 B.C. by a climatic deterioration that pushed the treeline as much as 200 miles further south. The area was largely unoccupied except for a transient appearance of an interior-adapted caribou-hunting Eskimo culture that had penetrated to the south in conjunction with the cooling climate. With this minor exception the southern half of the area was unoccupied until shortly before the beginning of the Christian era when a central Mackenzie District complex, that would eventually give rise to the historic eastern Athabaskan bands, occupied the region as well as the northern portions of the Prairie Provinces.

With the exception of the aforementioned penetration of Eskimo hunters deep into the interior around 1000 B.C., these cultures were Indian. In the west they gave rise to the Athabaskan-speaking Kutchin, Han, Tutchone, Tagish, Inland Tlingit and Kaska of the Yukon. Their linguistic and cultural kinsmen to the east in Mackenzie and Keewatin Districts included the Hare, Mountain, Bear Lake, Slave, Dogrib, Yellowknife and Chipewyan.

Canada's oldest artifact. This serrated scraper, found in northern Yukon Territory, was made by whittling and notching the upper end of a caribou leg bone. It was used to work animal skins. Since it was deposited the specimen has completely fossilized. A sample cut from the shaft was dated to around 27,000 years ago by the radiocarbon method. (*Archaeological Survey of Canada*)

The cultures that occupied the northern coastal regions of northern Canada are believed to be Eskimo. By approximately 3000 B.C., a distinctive Alaskan culture based on the seasonal exploitation of sea mammals and caribou spread eastward to occupy the northern coastal regions of the Yukon and Northwest Territories, Greenland, northern Manitoba and Quebec, and Labrador; their descendants eventually occupied the entire Newfoundland coast. As already mentioned, during the climatic deterioration following 1500 B.C. some of these Eskimo hunters, referred to collectively as the Arctic Small Tool tradition, penetrated the interior in search of the barrenland caribou herds and their distinctive tools have even been recovered from the northern fringes of Saskatchewan.

By 900 A.D., warming trends altered the ecology to favour the rapid migration of an Alaskan group of Eskimos called Thule and the Arctic Small Tool tradition population (Dorset) was replaced and absorbed by the newcomers. The Thule Eskimos were capable of exploiting the rich whale and other sea mammal resources and were eventually distributed across the northern coastal areas of the Yukon and Northwest Territories, Greenland, northern Manitoba and Quebec, and Labrador. With the gradual rise of land in the north and a shallowing of the water, the large whales disappeared and the Thule Eskimo developed into regional groups that represent the Central, Labrador, and Greenland Eskimos of the historic period. The Eskimos who historically occupied the mouth of the Mackenzie River, though related to this Thule expansion, show their closest connection with groups from the interior of western Alaska.

2.2 Exploration and settlement

The Norse sagas tell of the colonization of Iceland and Greenland in the 9th century and they also record exploratory voyages further to the west and south. Settlements in Greenland were founded about 985 A.D. by Eiríkr Thorvaldsson (Eric the Red), and some of these settlements lasted into the 16th century. Eric's son, Leifr Eriksson (Leif the Lucky) probably founded a settlement at L'Anse aux Meadows on the northern tip of Newfoundland about 1020 A.D. Carbon-14 dates on the meagre Norse remains at the site tend to confirm this date.

Norse sagas and archaeology do not always agree, but history can be used to confirm archaeology, and vice versa, and some triangulation of this obscure geography can be established within which further information can be added. Certainly a great number of voyages were made by Vikings and, later on, by other Europeans, fishermen especially, of which there is no record. Jacques Cartier (1491-1557) on his first major voyage of discovery in 1534 found a ship from La Rochelle 100 miles to the west of the Strait of Belle Isle, and directed it back onto a course for home. The voyage of John Cabot (fl. 1461-1499) in 1497 is documented in English archives, but whether he landed in Newfoundland or Nova Scotia to claim land for Henry VII is not clear. Cabot's purpose is, however, like that of Cartier, clear enough: to find land that produced things of value. Cabot found fish on the Grand Banks, something which had been known in the western ports of England and France for years, but he did not find much else of immediate value. Cartier found Indians and "*les diamants du Canada*", which later turned out to be quartz.

2.2.1 The search for riches

Canadian history thus begins as a quest for the riches of the New World. There are no voyages of discovery without incentives, and this particular stimulus is part of a continuing theme in Canadian history that lasts into the 19th and 20th centuries. Gilbert La Bine at Great Bear Lake in May 1930 was undoubtedly adding to our knowledge of Great Bear Lake but he was also looking for riches which in his case were silver, cobalt, and pitchblende. It was this search for economic gain that drove explorers westward in the 16th century. It was the basic driving force for the Spanish and Portuguese, for Cabot in 1497, Cartier in 1534, even perhaps for Champlain in 1603, many others after them, and most of all for the backers of these expeditions. No one would cross 2,500 miles of lonely, wild ocean in a small ship, no one would risk death and disease without powerful incentives. These dangers existed from the very first migrations westward in the 17th century, and it was not until the late 19th century that sea passages from Europe to North America could be thought of as reasonably safe and secure.

Many of the early enterprises of the French régime take their character from these fundamental conditions. That there were men of intelligence and high-mindedness who served New France, is, of course, beyond question — some of the Intendants, notably Jean Talon, and the Jesuits, are good examples and though the Company of 100 Associates had honest intentions they were frustrated by bad luck and the English — but most of the other early fur companies of New France, upon whom early colonization depended, fought in the court of Louis XIII for their monopoly control and made their money from the fur trade as rapidly as possible. They avoided, as much as they could, fulfilling conditions that they felt inconvenient or onerous, such as bringing out settlers.

The career of Samuel de Champlain (1567?-1635) illustrates this well. He was first an explorer with De Chastes at Tadoussac in 1603, then with De Monts in Acadia, 1605-7. When De Monts' Acadia trading privileges were revoked, Champlain returned to France, to reappear again under De Monts, to found Quebec in 1608. A new company was formed in 1610, and a whole series followed. Altogether he made some 21 voyages across the Atlantic, and died at Quebec in 1635.

Such vicissitudes illustrate the fact that the driving force behind these changes was the fur trade. This trade was mainly in beaver fur, especially the *castor gras*, prepared by being worn next to an Indian's skin all winter. Beaver was especially suited for the felting process available in France in the 17th century, and from this came the superb beaver hats so much in fashion in 17th and 18th century dress. It was in pursuit of the beaver trade that the French pushed far into the interior, to Hudson Bay, to the Mississippi valley, and reached the Canadian prairies by the early 18th century. This trade continued into the 19th century, moving farther and farther to the north and west. By 1808 Simon Fraser (1776-1862) had established fur trading

posts as far west as Fort St. James on Stuart Lake in north-central British Columbia, northwest of present-day Prince George.

The French were not the only ones interested in the fur trade. So also were the Dutch in New Amsterdam (New York) and in Fort Orange (Albany), and, after the cession of the Dutch colony to the English in 1664, still more formidable competition came from English traders. The Indians were the essential middlemen of the trade and both the French and the English vied for their loyalties.

The rivalry between the French and English in North America began early, and continued to affect the Indians for a long time. It seriously affected Indian life in the St. Lawrence Valley, Lake Ontario, Lake Erie and other Great Lakes areas, and reverberated westward from there: it also affected Indians in Hudson Bay in the late 17th century, in Newfoundland, and in Acadia, during a whole series of wars.

2.2.2 The French-English conflict

The French-English rivalry in Canada reflected the great European conflicts which began in 1689 and ended only with Napoleon's defeat in 1815. The year 1710 saw the fall of the peninsula of Nova Scotia to the English, confirmed in the Treaty of Utrecht in 1713. The French however still retained Île Royale (Cape Breton) and Île St-Jean (Prince Edward Island). They effectively occupied what is now New Brunswick and built Fort Beauséjour on the Chignecto isthmus to defend it. More important, they built Louisbourg at the southeast corner of Cape Breton Island, to defend the St. Lawrence approaches, and to act as an exchange point between New France, the French West Indies and France.

Louisbourg fell to the English in 1745, but was restored to France in the Treaty of Aix-la-Chapelle, 1748, that closed the War of the Austrian Succession. Halifax was then built

The King's Bastion Barracks, Fortress of Louisbourg, NS. Built between 1720 and 1745, the Fortress was captured by New England militia in 1745, restored to the French in 1748, recaptured by General Wolfe's forces in 1758 and destroyed in 1760. It is now being restored as a National Historic Site. (*Department of Indian Affairs and Northern Development*)

by the British government as a base to flank, and if possible to dominate, Louisbourg. The Seven Years' War (1756-1763) that followed, began with an undeclared war between Britain and France that started over the control of the Ohio valley. News of the defeat of the British army before Fort Duquesne (now Pittsburgh) in June 1755, helped to persuade the Governor of Nova Scotia, Charles Lawrence, to expel the 10,000 Acadians, an element in the colony that he believed dangerous for British control. Whether they were in fact dangerous has been much discussed since. The celebrated Acadian expulsion was to be followed later by an even more extensive *diaspora* — the Loyalist emigration from the United States after the Revolutionary war.

General James Wolfe (1727-1759) captured Louisbourg in 1758, and the following year captured Quebec City. Had France been in a position to send reinforcements to Canada in 1760, there is little doubt that Quebec could have been recaptured, for the French still held most of the rest of Canada; as it was, British ships were the first to be sighted in the St. Lawrence in May 1760, and the fall of New France became inevitable. The capitulation of Montreal followed in September 1760.

This final separation between New France and the mother country, the "old" France of Louis XV, was confirmed in the Peace of Paris of 1763. With this treaty France ceded to Britain all of her North American empire except her West Indian islands, French shore-fishing privileges on the Newfoundland coast, and the two small islands of St. Pierre and Miquelon.

Some 60,000 French Canadians and about 1,500 Acadians (who had drifted back) now faced a North America that was British from the Gulf of Mexico to Hudson Bay. A considerable debate has developed in recent years among Canadian historians over the effects of the cession on French Canadians. Some French Canadian historians argue that it had very little effect: that except for the loss of some senior French officials and the substitution of English officials and language at the upper levels of government, nothing much changed. Others, including some English Canadian historians, take the position that the cession was a disaster, making the French Canadians and Acadians a truncated people, cut off from the intellectual and physical resources of their own mother country.

Despite the scorched-earth policy that Wolfe had used ruthlessly in the environs of Quebec in the summer of 1759, the subsequent British military occupation to 1763 and the rule of Governor Murray (1760-1768) was on the whole benevolent. By force of circumstance French civil law was kept, but English criminal law was gradually adopted; both were officially recognized in the Quebec Act of 1774. What complicated matters was the immigration into the new province of Quebec by British Americans, Scots, and other English-speaking people in the 1760s and 1770s. They were to take up the main profit-making venture that Canada had: the fur trade. After the outbreak of the War of the American Revolution, 1775-1783, there was a further movement, this time of displaced farmers and gentry, mainly the former. This necessitated considerable shifts of policy, and it posed to governors like Sir Guy Carleton, Lord Dorchester (1768-78, 1786-96), formidable questions of adjustment between two quite different peoples and their different legal, religious and social systems.

Problems of this kind were partly solved in 1791 by dividing the old province of Quebec into two parts, Lower Canada and Upper Canada, each with its own legislature and legal system. About this time the old province of Nova Scotia was also split up: Prince Edward Island was established as a separate colony in 1769 (it was called the Island of St. John until 1799), and New Brunswick and Cape Breton Island were established as separate colonies in 1784, though Cape Breton was subsequently reannexed to Nova Scotia in 1820. Newfoundland was still nominally a fishing station with primitive jurisdiction and controls, and was to remain so until granted her own representative government in 1832.

2.2.3 Western explorations

To the north and the west of the Canadas lay the chartered territory of the Hudson's Bay Company, founded in 1670, comprising the enormous watershed of all the rivers flowing into Hudson Bay. Across the Rockies lay territory largely unexplored. Vitus Bering had surveyed the Bering Sea, Bering Strait, and part of the Alaskan and Kamchatkan coast for Peter the Great beginning in 1725 and continuing to 1741. The accuracy of his observations was confirmed by James Cook (1728-1779), the first Britisher to explore the west coast of Canada. This he did on his third Pacific voyage in 1776, going as far north as Bering Strait. One of

York Factory, chief depot of the Hudson's Bay Company, as it appeared at the height of its influence in 1853. The first building on this site was started in 1788 although earlier structures of the same name had been in the area since 1682. The Factory finally closed in 1957. Lithograph of a sketch by Chief Factor Alexander Hunter Murray. (*The Public Archives of Canada and the Hudson's Bay Company*)

Cook's midshipmen during this last voyage was George Vancouver (1757-1798). In 1791, as a Commander, Vancouver was sent to take control of the west coast from the Spaniards. From a base at Nootka Sound, he spent two years exploring the coasts of British Columbia and Vancouver Island. Vancouver narrowly missed meeting Alexander Mackenzie of the North-West Company who arrived at the head of Bella Coola inlet, on July 20, 1793, from Lake Athabaska. Mackenzie arrived at the Pacific just three weeks after Vancouver's exploring and surveying ships had passed.

In the years that followed it was mainly the senior wintering partners of the North-West Company who explored British Columbia. Simon Fraser (1776-1862) with tremendous fortitude and courage worked his way down the Fraser River in 1808 to tidewater. David Thompson (1770-1857) spent much of his life between 1798 and 1812 establishing new fur trading areas and working out the geography of the far western plains and especially the complexities of the Columbia River. The great enterprise that had sponsored all of these expeditions was the North-West Company of Montreal. This great Canadian company was finally amalgamated with the more efficient Hudson's Bay Company, operating from York Factory in Hudson Bay, in 1821.

During the War of 1812 the North-West Company had occupied and purchased, under threat of seizure, the American Fort Astoria, at the mouth of the Columbia River. This fort had been established by John Jacob Astor's fur company, and ended his adventures in the Oregon country. This area, around the lower Columbia in what are now the states of Washington and Oregon, was largely held by British Canadian interests, represented after 1821 by the Hudson's Bay Company. It was to continue there until the gradual drift of American settlers into the Willamette valley in the late 1830s and early 1840s made the position of the Company more difficult. The Oregon Boundary Treaty of 1846 forced the Hudson's Bay Company to move its trans-Rocky Mountain operations to Fort Victoria at the southern end of Vancouver Island.

2.2.4 The War of 1812

The War of 1812 was a war the Americans thought they won, the Canadians believed they won, and the British, who did no small share of fighting, have largely forgotten about. The war was caused by two disparate elements in the United States. There were those who were incensed at the occasionally harsh treatment of American merchant ships and seamen on the

high seas by the British Navy. This was owing to British insistence on control over neutral ships approaching Europe, then largely dominated by Napoleon. The second element in the United States was more vociferous: a group from the new western tier of states, Kentucky (1792), Ohio (1802), and Indiana Territory (a state in 1816), called the War Hawks, wanted Canada, especially Upper Canada, to be part of the United States. These elements joined to produce a clear but by no means overwhelming majority for a war resolution in the American Congress in June 1812. Canada was successfully defended, though not without difficulty, by British troops, British North American defence regiments, militia and Indians. At sea, despite some individual setbacks, the British Navy was able to control the coasts around the Atlantic seaboard. By the end of the war Britain had possession of Maine as far south as the Penobscot, and controlled Michilimackinac and part of what is now Michigan and Wisconsin.

The Peace of Ghent was made in December 1814, while the Congress of Vienna was preoccupied with the much more formidable question of a general European settlement. It was owing to these preoccupations that Great Britain accepted the *status quo ante bellum* as a definition of boundaries. The main issues between Britain and the United States were left until the Convention of 1818. This Convention regulated the North Atlantic fisheries' question and settled the western boundary between British North America and the United States as the 49th parallel from Lake of the Woods westward to the Rockies. The country west of the Rockies was left under joint occupation of both countries from the northern border of Spanish California, 42°N, to the southern border of Russian Alaska at 54° 40'N. Altogether, the settlement kept the British North American border relatively peaceful until the disruptions caused by the Rebellions of 1837.

2.2.5 The 1837 rebellion

In the 1830s serious problems arose in Lower Canada. Though similar structural and constitutional issues developed in other provinces, notably Upper Canada and Nova Scotia, in Lower Canada there was a complex of issues. There was the obvious constitutional one: an Assembly with a French Canadian majority trying to acquire, under the vigorous leadership of Louis-Joseph Papineau (1786-1871), control over an Executive Council composed mainly of British Canadians with a few French Canadian supporters. The British element wanted to keep control of the Executive Council and at the same time persuade the Assembly to spend more money on commercial development, such as improving the canal system, but the Assembly resisted. More deep-seated problems were, however, the agricultural crisis in Lower Canada caused by declining yields of wheat and other grains on old, long-used seigneurial lands, (wheat rust and declining yields became especially obvious in the area of the Richelieu valley by the 1830s), and the commercial crisis of 1837 which affected both the United States and British North America. These crises exacerbated all the other grievances.

The catalyst of the trouble was a constitutional quarrel with the British government and the Executive Council of Lower Canada. Sporadic fighting broke out in November 1837 in Montreal and warrants were issued by the Governor General for the arrest of the *Patriote* leaders. Fighting began in the Richelieu valley by mid-November and was put down by British troops and much more ruthlessly by British Canadian militia, who used the opportunity to settle numerous old scores. In Upper Canada a smaller rebellion took place under the volatile leadership of William Lyon Mackenzie (1795-1861). It too was put down by local militia — all the regular British troops having been sent to Lower Canada. Mackenzie however escaped, as had Papineau, to the United States, where both took the lead in fomenting border troubles for the next year. Americans, in New York state especially, believed that the time was now ripe for Lower Canada and Upper Canada to fall into American hands or, at the very least, that they should help the two colonies become separate republics.

2.3 Responsible government and Confederation

Lord Durham (1792-1840) was commissioned by the British government as Governor General to find the causes of the Lower and Upper Canada troubles and to recommend changes. He arrived in Quebec City in May 1838.

The result of these recommendations, incorporated in his *Report on the affairs of British North America*, was the union of the two provinces of Upper and Lower Canada into the one province of Canada in 1841. Durham believed that the French Canadians would have to be assimilated within an Anglo-Saxon community. Union was naturally disliked in Lower

Canada but, in any case, its prime purpose was to be frustrated by an alliance between French Canadian reformers under Louis-Hippolyte Lafontaine (1807-1864) and Upper Canada reformers under Robert Baldwin (1804-1858), both of whom were leaders in the movement for responsible government.

2.3.1 Toward responsible government

Responsible government had been one of Durham's recommendations, but the British government did not believe it was possible to implement it. After a change of ministry in London, however, and a great deal of manoeuvring in the province of Canada and in Nova Scotia, responsible government was effectively achieved by both in 1848. Newfoundland, Prince Edward Island and New Brunswick had their own approaches to this question though the forms of government were the same. Newfoundland and Prince Edward Island were sufficiently small and parochial that even a liberal-minded British government felt it difficult to concede responsible government to them but by 1855 all five colonies had their own working versions of the principle.

These constitutional changes of the 1840s were accompanied by rather drastic commercial ones, affecting wheat and lumber exports especially. Britain's need for wheat and lumber had grown rapidly as a result of the changes wrought by the industrial revolution. Britain lowered her customs duties on colonial produce which stimulated the export business from Canada and New Brunswick in lumber, wheat and flour. Canadian flour could be milled, by British regulation, from both Canadian and American wheat; and between 1843 and 1846 a considerable milling business was begun in the province of Canada. Then, in 1846, as a result of the pressure of bad harvests of 1845 and famine in parts of Ireland, Britain abandoned all forms of protection, eliminating the advantage enjoyed by the Canadian milling business. The preference for Canadian wheat and flour was broken and by 1848 Canada was suffering from a severe commercial crisis, aggravated by a general one which it shared with the United States. These conditions were largely responsible for the riots in Montreal in April 1849 when the Governor General, Lord Elgin (1847-1854), was harrassed as he signed the Rebellion Losses Bill. The Parliament buildings in Montreal were set on fire shortly afterward and Montreal was never to be a capital city again.

By the early 1850s the commercial depression was over, and Canada experienced its first railway boom. Railways changed all of British North America in the 1850s. The story of the inception and building of the Grand Trunk Railway, the Great Western Railway and others in the province of Canada, the European and North American in New Brunswick, the Nova Scotia railway, and long efforts to build the Intercolonial railway from Halifax to Quebec, is lengthy and complex, but the changes they produced in Canadian society were permanent. Railways made possible the growth of cities which began in the 1850s. Railways also changed the countryside as they broke down isolation. They also made possible the conceptions that were to lead to the union movement of the 1860s.

It was no accident that the 1860s were an age of political unions. Italy was made one country between 1859 and 1861; Germany was largely united in the North German Confederation of 1867; the United States defeated an attempt to split the country in the Civil War of 1861-1865. All of these events were, to a considerable degree, the concomitants of railways.

2.3.2 Events leading to Confederation

Some of the strongest forces that helped to produce Confederation were external to British North America. The American Civil War broke out in 1861 and soon created a climate of tension and unease throughout British North America, noticeably after the *Trent* crisis in November 1861, and increasingly as the war went on. Nor were these the only tensions in North America. In Mexico a revolutionary struggle had been going on since 1858, under the leadership of Juarez, and the eventual result was that Emperor Maximilian — the brother of Franz Joseph II of Austria — was shot on orders of Juarez, in June 1867. Well might Thomas D'Arcy McGee (1825-1868) declare in 1865 "...we were taught that the days of the colonial comedy of Government were over and gone, and that politics had become stern, and almost tragic for the New World". McGee himself was assassinated in 1868. These conditions made the far-reaching changes proposed by Confederation justifiable to some, essential to others, and made resistance to Confederation more difficult.

Moreover, Great Britain was going through a phase of anti-colonial attitudes, at least as far as her North American colonies were concerned. The most obvious symbols of this were the increasing reluctance to spend money on British North America, or to keep troops there, and the encouragement of the North American colonists to stand on their own feet as much as possible. British troops were indeed stationed in North America and more were sent out at the time of the *Trent* crisis, but a decade later, in November 1871, the last of the British troops left the Citadel of Quebec, leaving only Halifax with a garrison of British troops.

These external pressures would not of themselves have effected a union of British North America but they established conditions by which it was possible to justify very far-reaching changes. Internally, the driving force for change came from Canada West. That section of the province of Canada had become increasingly dissatisfied with the union of 1841, and wanted to have the political power that its million and a half people warranted. It now had half again as many people as Canada East, yet by the union constitution it had equal representation with Canada East in the Canadian Assembly. Hence arose the cry of the Reform party of Canada West, "rep. by pop.," that is, representation according to population.

John A. Macdonald and the Conservative party, and their Bleu allies in Canada East under George-Étienne Cartier (1814-1873) resisted these demands as long as they could. But by 1864 it became clear that unless some solution were found for the political demands of Canada West no government could long survive. In June 1864, a strong coalition was formed between the Conservatives and the Bleus on the one hand and the Reformers of Canada West led by George Brown (1818-1880) on the other, with the aim of achieving a British North American Confederation.

The Atlantic colonies were separated from the province of Canada by miles of forest, the mountains of Gaspé and the salient of Maine, and each had a different history and orientation. Prince Edward Island and Newfoundland were both somewhat distant from mainland concerns. Many of the Prince Edward Islanders whom George Brown met in 1864 had never left the island, and this was even more true of Newfoundlanders. Nova Scotia was a maritime colony of some importance with her ships, and those of New Brunswick, trading in the ports of the seven seas. Both Nova Scotia and New Brunswick evinced some interest in a union of the three Maritime colonies, but it was largely ephemeral. Nova Scotians had talked about both a Maritime union and a British North American union during the 1850s but none of the newspapers and few of the politicians who took part in these discussions seemed to have many practical suggestions as to how to achieve either of them.

A Maritime union conference called to meet at Charlottetown, Prince Edward Island, on September 1, 1864 showed some evidence of Maritime pressures, but mainly the pressure came from the province of Canada which wanted to present its own proposals for a Confederation of British North America. In the event, the Canadians swept the board at Charlottetown. Maritime union vanished and the Maritime delegates were caught up in the glittering Canadian proposal for Confederation, more easily since the Canadians brought with them a well-defined outline of just how it might be effected.

At the Quebec Conference in October 1864 the scheme was elaborated formally in 72 resolutions. It was accepted by the British government but then had to be ratified by the legislatures of the five colonies. The province of Canada passed it in March 1865 but a New Brunswick election at just that time defeated any further progress in the Maritime provinces. Nova Scotia was sufficiently opposed that there was no hope of passing it unless New Brunswick agreed. Prince Edward Island was to refuse to have anything to do with Confederation until special circumstances caused it to join in 1873. Newfoundland was less opposed to Confederation than Prince Edward Island, but it hesitated uneasily, and an election in 1869 defeated any hope of it joining at that time. The idea was not successfully revived in Newfoundland until 1948.

In 1866, however, strong pressure from the British government, together with threatening gestures from the United States, exemplified in the Fenian raids of April and June 1866, swung New Brunswick around, helped also by strong action from the Lieutenant-Governor of New Brunswick, Arthur Gordon (1861-1866). Nova Scotia then passed a Confederation resolution. The British North America Act was passed through the British Parliament early in 1867, and brought into effect on July 1, 1867.

The British North America Act had a number of noteworthy accomplishments to its credit, but there were also some things which it did not do. The Act effected a federal union

between Canada, New Brunswick and Nova Scotia, with provisions for the later addition of Prince Edward Island, Newfoundland, the Hudson's Bay Company's territory in the northwest, and the colony of British Columbia. It continued the old boundaries of New Brunswick and Nova Scotia as well as most of their old structures of government; and it split the province of Canada into two new provinces, Ontario and Quebec. It established a strong central government at Ottawa with the great bulk of the legislative and taxing power. It gave to the provinces a certain modest share of legislative powers exclusively their own. The only breaches in this exclusive provincial control over their own sphere of power lay in the federal right of veto of provincial legislation, and certain rights of appeal of a minority against breaches of their educational privileges. What the British North America Act did not do was to spell out how these governments were to work; it was simply assumed to be the British system of cabinet executive government responsible to an elected legislature. Thus the Canadian Constitution is partly written, and partly unwritten, the latter being quite as important in its own way as the former.

A Father of Confederation and probably its chief architect, Sir John A. Macdonald, 1815-1891, was the new nation's first Prime Minister. (*Portrait by Mrs. Irma Coucill*)

Sir John A. Macdonald was the first Prime Minister of the new Dominion of Canada, and created a Cabinet on national lines. Except for the years 1873-1878 he was to remain in power until he died in 1891. Manitoba, formed out of North-Western Territories which had been bought from the Hudson's Bay Company, joined Confederation in 1870; British Columbia joined in 1871 and Prince Edward Island in 1873.

The problems of governing the vast aggregations of western territories were formidable, and the Canadian government had as yet very little knowledge, experience, or even understanding of them. There would have been no province of Manitoba at all in 1870 but for the resistance of Red River people to the Canadian takeover from the Hudson's Bay Company. The Métis of Red River, under the leadership of 28-year-old Louis Riel (1841-1885) forced the Canadian government into granting provincial status to Manitoba.

Similar attitudes on the part of Ottawa affected the early history of the vast North-West Territories. Treaties with Indians were begun, but other problems were not considered very seriously until 1873. Partly as a result of the infiltration of American fur traders into what is now Alberta, and partly as a result of the Cypress Hills massacre in May 1873, the North-West Mounted Police was organized and dispatched westward in 1873, taking up a series of posts across the west, beginning in the summer of 1874.

2.3.3 Building a nation

At this early period, Canada was still mainly a moral and political union, a union on paper, without real economic and physical links to hold it together. Businessmen and MPs, travelling to Montreal or Ottawa from the Maritimes, had to go via Portland, Maine; MPs from Manitoba travelled via St. Paul, Minnesota; those from the west coast had to go to San Francisco by ship and thence eastward by the Union Pacific Railway. Canada needed to be joined together by railways. The first of these, the Intercolonial Railway, was embarked upon almost at once after 1867 with the government surveying the route, constructing the line and operating the railway. It went from Halifax via Moncton, Campbellton and the Matapédia valley to Quebec. The first through train from Halifax to Quebec arrived at Lévis on July 6, 1876.

The construction of the 561-mile Intercolonial Railway was by no means easy even with an Imperial government guarantee to back the required bond issues of the Canadian government. The building of the Pacific Railway, nearly 2,000 miles from North Bay, Ont. to Vancouver, BC, was far more formidable. In 1871, when British Columbia joined Confederation, the Macdonald government committed itself to starting the railway within two years and completing it within ten. This was impossible. For one thing, surveys of routes had to be made and no one had any idea where an economical and efficient route through British Columbia would be found. As a result of early experience with government construction of the Intercolonial, the Macdonald government decided to allow a private company to build the Pacific Railway. Macdonald knew the project was sufficiently large to absorb more than the available capital in Canada as Sandford Fleming (1827-1915) had estimated it would need at least \$100 million. Toronto and Montreal interests were both interested in building such a railway and Americans also wanted to supply capital. All these conflicting interests culminated in the famous Pacific Scandal which brought down the Conservative government of Sir John A. Macdonald in 1873.

The new Liberal Prime Minister, Alexander Mackenzie (1822-1892), pushed forward the work of government surveying and construction as government resources allowed. Throughout his term of office he struggled with the enormous costs of Sandford Fleming's surveys in British Columbia, and began construction of the line between Fort William and Winnipeg. Five years later the Conservative government was returned to office but progress on railway construction was hampered by lack of government finances until the fall of 1880 when a private company was formed that was strong enough financially to undertake the enormous task. The Canadian Pacific Railway Company began work and within five years the last spike was hammered home, thanks to a dynamic general manager, William Van Horne (1843-1915) and a good deal of support from the Canadian government. Furthermore, the government had constructed the most difficult part of the railway between Kamloops and Vancouver.

It was the CPR that enabled the Macdonald government to transport Canadian troops west to defeat the combined Métis-Indian forces in the North-West rebellion of March to May 1885. The North-West Mounted Police had controlled and pacified the west from 1873 onward, but could not handle a large-scale outbreak such as that of 1885. The trial and execution of eight Indians for the massacre at Frog Lake and other incidents of the rebellion did not arouse much controversy in the east but the execution of Louis Riel (1844-1885), the leader of the rebellion, did. Although the Catholic Church condemned Riel as an apostate, his fate engaged the sympathies of French Canadians. The Macdonald government was caught between two factions: Ontarians and some westerners who demanded Riel's death, and Québécois and other westerners who, while admitting Riel was guilty, felt that the Macdonald government was also guilty of having provoked a rebellion in the first place. One result of Riel's execution was that the Conservative party was weakened in Quebec sufficiently to allow Honoré Mercier (1840-1894) win a narrow victory in the 1886 election. The party recovered sufficiently to defeat Mercier decisively in 1892, however, it was never quite able to disassociate itself from the Riel affair.

Macdonald died in June 1891 and was succeeded by Sir John Abbott who in turn was succeeded by Sir John Thompson (1844-1894) who took office in December 1892, the first Nova Scotian to become Prime Minister of Canada. Thompson died suddenly in 1894 and the Conservative government fell in 1896 after 18 years in power, on a complicated and difficult issue, the Manitoba Schools Question. This was one of several awkward questions of provincial minority rights to separate schools. In the 1870s Manitoba had developed its

separate school system from its own local needs and traditions. By 1890, however, Protestant immigration had reduced the Roman Catholic population to a relatively small minority and the Manitoba government felt justified in establishing a "non-denominational" school system; but the Catholics felt it was a Protestant system in disguise. The Catholics had a good case against the new system on legal and constitutional grounds and the case of *Barrett vs. Winnipeg* went to court. The Supreme Court of Canada in 1892 accepted the Catholic contention, but that decision was thrown out by the Privy Council in London. The political remedies that were applied, as by the British North America Act they could be, brought down the Conservative government of Sir Mackenzie Bowell (1823-1917). Wilfrid Laurier (1841-1919), the Liberal leader, promised to negotiate the question with the Liberal government of Manitoba and, despite a good deal of opposition from the hierarchy of the Roman Catholic church, he won the election of 1896 defeating the Conservatives under the leadership of Prime Minister Sir Charles Tupper.

2.4 The 20th century

The Liberal government of Sir Wilfrid Laurier lasted for 15 years. It is customary to say that his régime inaugurated the real beginning of Canada's considerable growth in the 20th century, but the foundation for this growth had already been laid. Canada's industrial revolution had started the trend to the cities although even in 1900 70% of Canadians still lived in communities with a population of less than 500. Telephones came into general use in the 1880s and electric light began to be used about the same time. Typewriters were frequent in offices by the end of the 1890s. Even horseless carriages had begun to appear, although the bicycle was the current rage of the 1890s. Not all of these changes were considered good, however useful they may have been. There were complaints of the ghastly cribbing of wires and poles that had already substantially disfigured the neat-looking streets of the 1860s.

The Laurier years are also celebrated for the considerable immigration into the Canadian west. Factories and the transportation system to sustain such growth were already established, and two more transcontinental railways were added to Canada in those optimistic years before 1914. Canada's population in the 1901 Census was 5.4 million; ten years later it was 7.2 million with the growth heaviest in the west. Canada's wheat production was 56 million bushels in 1901; it leaped to 231 million in 1912.

Alberta and Saskatchewan were created as separate provinces in 1905. Ontario and Manitoba attained their present boundaries in 1912 and Quebec was extended northward to include mainland Ungava.

Laurier's Liberal government fell in 1911, due partly to a vigorous Quebec reaction against Laurier's new Canadian Navy. Even more important was a strong Canadian nationalist reaction to the proposed reciprocity treaty with the United States. This nationalism was taken full advantage of by the Conservatives under Robert Borden (1854-1937), who carried the election with 134 Conservatives to 87 Liberals. The Borden government drew much of its support from Ontario and some from Manitoba. The Maritime Provinces, Quebec and the rest of the western provinces returned a majority of Liberal members supporting Laurier.

The Conservative government's basic strength lay in its persuasive mixture of Imperial glory and Canadian nationalism. At that time it was not easy to separate them, as Laurier had found out on the occasion of the Diamond Jubilee in 1897 and during the Boer War, 1899-1902. A Canada independent of Britain was not easy to imagine: but while the kind of truculence the United States exhibited during the Alaskan boundary arbitration of 1903 seemed to recommend continued reliance on the British, the way in which Britain had conceded so many points to the Americans showed the merits of Canadian independence. Laurier was much influenced by the young generation of Canadian nationalists from Quebec, led by Henri Bourassa (1868-1952), grandson of Papineau, whose desire to be free of British entanglement was to reappear as English Canadian nationalism 50 years later. Conservatives were convinced that the Liberals, by backing away from Imperial commitments as Laurier had, were inviting disaster. Cartoons in Conservative papers in the 1911 campaign showed Conservative attitudes: the American tiger getting ready to gobble up Canada the moment it stepped out from British protection.

The naval issue also revolved around these two opposing points of view. Laurier sponsored, and Parliament passed, an Act in 1910 establishing the structure for a Canadian Navy. Conservative naval policy, on the other hand, was Imperial in character. It envisaged a

money contribution to the British Navy sufficient to build three dreadnoughts – then the latest weapon in naval design – to be used by the British Navy and ultimately perhaps to become part of a Canadian one. Borden did not offer this gift unconditionally: in return he wanted a Canadian voice in determining British naval and foreign policy. This was something that the British found difficult, if not impossible, to concede. However, after forcing the Naval Aid Bill through the House of Commons in 1912 under new rules of closure the government had to abandon the Bill as it was defeated by the Liberal majority in the Senate.

2.4.1 The First World War

Legally, when Britain was at war Canada was at war; in 1914 there was no question that most of Canada, including Quebec, supported a war waged by England, France and Russia against Germany and Austria. In October 1914, 33,000 Canadian troops sailed for overseas, many of them never to return, and other divisions followed. The Canadians were among the best Allied shock troops on the western front, in that hideous landscape of barbed wire, machine guns and mud, defensive techniques so effective that attacks of any kind, whether by Germans or Allies, resulted in staggering casualties. In Borden's view, the Canadian commitment to the war in men and material warranted a voice in the British conduct of the war. Information was indeed conveyed at the highest level; but consultation was another matter.

By 1917 the rate of Canadian casualties was already causing a crisis in Canada. Borden came back to Canada in May 1917 after a visit to Britain, convinced that the allied position was critical and that Canada would have to do more. Others at home were not so convinced. The Canadian army had enlisted French Canadians but generally the government had failed to enlist their sympathies. Some of this failure was undoubtedly attributable to the government itself. There was a dispute in Ontario over French-language schools and Henri Bourassa believed that domestic threats to French Canadian life at home ought to be eliminated before tackling enemies abroad.

Borden introduced conscription, but could not carry Laurier with him. The Liberal party split, some English-speaking Liberals joining Borden's government in a Unionist coalition. Essentially, Borden had to govern without French Canada. There was some opposition to conscription in Canada, not only in Quebec but also among farmers in Ontario, the west and in the Maritimes. Nevertheless, in the 1917 election, Borden and his colleagues took 153 seats, against 82 for the Liberals. This figure underestimates, however, the support of the Liberal party: Laurier and his Liberal remnant took 40% of the popular vote, 74% in Quebec and about 45% in the Maritime Provinces.

Borden insisted upon Canada's voice being heard in Imperial war policy and to a considerable degree carried this insistence right through to Canada's signing the Versailles Treaty in its own right. The first major step in the development of national sovereignty had thus been taken.

The war caused a good deal of inflation and economic maladjustment in Canada which was reflected in the postwar period by the Winnipeg General Strike of May 1919 and the great diversity of regional interests and political parties evident in the election of 1921. There were new men on the scene: Borden had retired in 1920 to be replaced by Arthur Meighen (1874-1960); Laurier had died in 1919 and was replaced by Mackenzie King (1874-1950) who became Prime Minister in 1921.

2.4.2 From prosperity to depression

Canada of the 1920s was already a perceptible distance from the Canada of a decade before: automobiles were now commonplace and women had the vote. Prohibition which had achieved temporary success during the war was now gradually being eased by the establishment of provincial government-owned liquor stores. The stock market blazed its meteoric course across the later twenties and many Canadians were caught both in its rise and more disastrously in the crash that came in October 1929. Savings large and small disappeared and the enormous liquidation of investment went on into the early thirties. Britain went off the gold standard in 1931, the beginning of the end for the British pound's 70-year role as the world's international currency. The economic plight and the frustrations of the unemployed took its vengeance on Mackenzie King whose Liberal government fell in 1930.

R.B. Bennett (1870-1947) and his new Conservative government urged Canadians to tighten their belts. Government budgets were cut and deflation went steadily on. Dollars

became fewer and more valuable, gross national income dropped 45% in the three years between 1929 and 1932. Wheat and other primary exports became unsalable. Canada's dependence upon exports of wheat, lumber, pulp and paper made it especially vulnerable to deteriorating overseas markets. By 1933 one quarter of Canada's labour force was out of work; those who still had work clung precariously to their jobs, even if wages were cut.

The world price of wheat dropped to 60 cents a bushel from a 1929 high of \$1.60; this paid only slightly more than the cost of threshing and gave the farmer a net return of 25 cents a bushel. Even with that low price the farmer might have mortgaged his equipment and squeezed by for a year or two, if there had been good crops, but what devastated the west was not just the low price of wheat — they could not grow it. A series of terrible droughts in the summers of 1931 to 1934 ruined thousands of western farmers and turned their farms into desolations of wind and dust. Provincial governments everywhere struggled with relief programs but those in the west were overwhelmed. Municipalities were, however, the hardest hit.

What the national economy needed was massive doses of money but no federal government of those days dreamed of bold monetary and fiscal measures. They thought in terms of balanced budgets and careful housekeeping, much as individuals themselves do at such times. What was needed was the opposite. Keynesian economics was applied successfully by the Nazis in Germany who had hardly heard of Keynes, and it was also tried tentatively by President Franklin D. Roosevelt in the United States, with much backing and filling and amid a great deal of public criticism. Broadly speaking, it can be said that World War II cured the Great Depression in Canada by bringing about the application of what amounted to Keynesian techniques.

Oil and grain, the two products of the mid-west which enabled Canada to build a strong national economy from coast-to-coast. (*Imperial Oil Limited*)

In the meantime, some Canadians, disillusioned with the vagaries of the free enterprise system, were turning to other economic philosophies: The Co-operative Commonwealth Federation (CCF) was founded in 1932 and the new Social Credit party won the Alberta provincial election of 1935. R.B. Bennett, in desperation, launched his own version of Roosevelt's "New Deal" early in 1935. It did not save him or his party; they crashed to defeat in the October 1935 election, winning only 40 seats. "King or Chaos" had been the Liberal election slogan; the voters may not have wanted King that much but they wanted R.B. Bennett even less and the depression so unhappily associated with his government.

2.4.3 The Second World War

Canada's entry into World War II came at a time when the government and a considerable section of the Canadian population had been slowly weaned away from Europe and to a degree from Britain too. Mackenzie King's government had cultivated the development of Canada as a separate Dominion within the British Commonwealth and equal status with Britain had been officially recognized in the Statute of Westminster in 1931. Mackenzie King disliked European commitments of any kind and was prone to regard the foreign policies of Britain and France as old-fashioned balance-of-power diplomacy. He was confirmed in these views by an interview with Hitler in 1937 which convinced him of the sincerity of what he believed were Hitler's peaceful intentions. King also cultivated cordial relations with the United States through his friend Franklin D. Roosevelt.

The Canadian government declared war on Germany on September 10, 1939, nine days after Britain. At first there was only a limited commitment to overseas service but within nine months all was changed; by June 1940 the war was vastly different and profoundly disturbing. Between Hitler and the complete mastery of Europe stood only Britain, Canada, and the three other Commonwealth countries, Australia, New Zealand and South Africa. Canada's war effort now became total.

The Canadian Navy, with a more substantial base to begin from than in 1914, expanded rapidly, taking on virtually all convoy duty in the northwest Atlantic. Canada also administered the British Commonwealth Air Training Plan under which air crews from all Commonwealth countries were trained. Division after division of Canadian troops crossed to England. Their restlessness there — one can only train for so long — helped persuade the British and Canadian commands to test the German defences on the north coast of France and the disastrous Dieppe raid of August 1942 was the result. While the lessons of Dieppe proved invaluable for the great Allied invasion of June 1944, Canadians paid a terrible price for the experience.

Japan forced the United States into the war in December 1941 by the raid on Pearl Harbor and United States troops landed with the British in North Africa in the autumn of 1942. The Canadians joined in the assault on Sicily the following summer, crossed the Italian mainland and fought in the long and bitter Allied campaign against tenacious and skilful German resistance in Italy throughout 1943-44.

The campaigns of 1944 in Italy and in northwest Europe were fraught with heavy casualties for Canadian troops and by the early autumn of 1944 reinforcements were badly needed. In the October 1939 Quebec general election, when they sought the reinstatement of a Liberal government in that province, Ministers of the King government — most notably Ernest Lapointe (1876-1941) and P.J.A. Cardin (1879-1946) — had promised no conscription for overseas service. In 1942, by means of a plebiscite, the government sought release from this pledge. The result of the vote, however, was not clear: 64% of the voters were willing to release the government from their promise but in Quebec the vote was only 28% while in the rest of Canada it was 80%. There was already conscription for home defence, but should conscripted troops be sent overseas? The question nearly broke the King government in 1944. After a three-week crisis and the resignations (although for opposite reasons) of J.L. Ralston (1881-1948), Minister of Defence, and C.G. Power (1888-1970), Minister for Air, the Canadian government ordered the home defence troops overseas on November 23, 1944.

A general election was held in June 1945 shortly after the end of the European conflict. Mackenzie King was re-elected but with a narrow majority of only five seats. He retired in 1948 having held office longer than any previous Prime Minister in the British Commonwealth. He was succeeded by Louis St. Laurent (1882-1973).

Mr. St. Laurent presided over the entrance of Newfoundland into Canada on March 31,

1949, although the groundwork for this had been laid in 1947 and 1948. In 1949, the Canadian electorate, now including Newfoundland, gave him an overwhelming victory with a majority of nearly 70 seats.

2.4.4 Postwar development

The St. Laurent era covered the first years of remarkable postwar development in Canada. Gross national product rose from \$12 billion in 1946 to \$31 billion in 1956 and to \$61 billion in 1966. Much of this growth came from profound changes in the structure of the Canadian economy: the development of the service industries, the increased development of forest and mining products and their processing, and the expansion of the steel and aluminum industries. Oil discoveries, however, provided the real impetus to the economy. Before 1947 the old Turner Valley field accounted for less than 10% of Canadian consumption. Then in February 1947 Leduc No. 1, just south of Edmonton, came in, the first revelation of the enormous potential in both oil and natural gas. By 1956 oil led all other minerals in value and supplied 75% of Canada's needs. Much the same story is true in the development and exploitation of iron ore in Ungava, along the Quebec - Labrador boundary. The first shipment of ore in 1954 spurred the development of the St. Lawrence Seaway which was completed in 1959.

One of these developments was the natural gas pipeline planned to run 2,200 miles from Alberta to Montreal. The financing was complicated, involving substantial amounts of American capital and with Canada building the uneconomic sections through northern Ontario. The measure passed through Parliament but it was a stormy and disputed passage. The famous pipeline debate contributed heavily to the fall of the St. Laurent government in the 1957 election. The Progressive Conservative party, under the leadership of John G. Diefenbaker (b.1895), won the most seats in this election, although it was by no means a clear majority. Another election was held in 1958 and Mr. Diefenbaker secured the largest majority of any party in Canadian history with 208 seats to the Liberals' 49 and the CCF's 8. However, in the next election held in 1962 Mr. Diefenbaker was reduced to leading a minority government and in 1963 the Liberal party took over again, a minority government itself, but one which managed to stay in office.

Lester B. Pearson (1897-1972) became leader of the Liberal party on the retirement of Mr. St. Laurent in 1958, and was Prime Minister from 1963 to 1968. Mr. Pearson's career paralleled the development of the nation from a country concerned primarily with its own internal problems to one of international stature and importance. Canada's participation in the creation of the United Nations brought the attention of the world to the value of diplomacy as practised by a "middle" power. While that role has been modified by recent events it was at the time of considerable importance in world affairs.

The domestic economy also experienced radical changes during this period. In response to the demand of returning veterans for a better deal on demobilization and pressure from the general public not to allow a return to prewar economic conditions, the government embarked on social programs which were similar to those being introduced in Britain and other Commonwealth countries. The Unemployment Insurance Act was introduced in 1940, Family Allowances in 1944, Old Age Security in 1951, Unemployment Assistance in 1956, the Canada and Quebec Pension Plans in 1965, the Guaranteed Income Supplement and the Canada Assistance Plan in 1966.

After much debate a new Canadian flag was chosen and raised on Parliament Hill for the first time on February 15, 1965. Perhaps it can be said that the single maple leaf symbolizes a political entity built upon a diversity of regional, even local, loyalties. The Canadian federation is not only a political reality, but one might almost say an emotional one. Canada has survived as a federation because the binding political and emotional forces have been stronger than the forces favouring disintegration. Canadians are conscious of both their country and their province, but the weight given to the orders of jurisdiction varies greatly from province to province, and over time. The very survival of a federal state of Canada's size — 3.85 million sq miles, and the second largest country in the world — is a feat in itself. Canadians have committed large material resources and invested considerable emotional energy in efforts to preserve national unity against internal disruption, to establish national independence, and to maintain that independence in the face of a neighbour to the south of nearly Canada's area but with ten times its population and economic power.

Canada celebrated the one hundredth anniversary of Confederation in 1967 in a year-long birthday party which included events ranging from local efforts involving a few individuals to the supremely successful Expo 67 in Montreal. This exhibition showed Canadians and the world what could be achieved through the peaceful blending of cultures in one society.

Chapter 3

The Constitution and the law

As the society of a country becomes more highly developed, the body of law governing its citizens becomes more complex. This chapter has been planned to explain, in a systematic manner, the law as it has evolved in Canada. The basis of written law, the Constitution, is dealt with in some detail, followed by a discussion of the distribution of powers between federal and provincial jurisdictions. Application of the law involves the Courts, the legal profession and the various agencies charged with enforcement. The ultimate concern of these agencies, the lawbreaker, and correctional institutions are studied in the concluding sections.

3.1 The Constitution

The Canadian federal state, which today comprises ten provinces and two northern territories, had its beginning over one hundred years ago in the enactment by the British Parliament on March 29, 1867 of the British North America Act, 1867. Fashioned largely out of the Seventy-two Resolutions drafted at Quebec (1864) by the Fathers of Confederation, the BNA Act, 1867 provided for the federal union of the three British North American provinces (Canada, New Brunswick and Nova Scotia) in one Dominion under the name of Canada.

Although the new nation that came into being on July 1, 1867 was a federation comprising four provinces (Ontario, Quebec, New Brunswick and Nova Scotia) Section 146 of the Act provided for admission into the Union of the Crown colonies of Prince Edward Island and Newfoundland on the Atlantic and the united (1866) island and mainland colony of British Columbia on the Pacific, and also of the vast expanse of Hudson's Bay Company territory in the northwest known as "Rupert's Land and the North-Western Territory". Following negotiation of an agreement on terms comprising the Company's surrender of its authority and territories to the Crown (which was to transfer them at once to Canada) and the retention of one twentieth of the land of the fertile belt (the southern territories) with designated blocks of land around its trading posts and a Canadian cash payment of £300,000, the new nation of Canada was ready to expand westward with considerable momentum across the continent to the Pacific.

The acquisition by Canada of Rupert's Land and the North-Western Territory permitted limited provincial establishment of the Red River settlement under the name of Manitoba in 1870; provided the federal government with public lands needed to help subsidize a transcontinental railway linking the Pacific with the Canadian east, thereby fulfilling the pledge to British Columbia to begin the Canadian Pacific Railway within two years and laid, through the provision of millions of acres of public lands, the land and economic bases for the federal government's adoption of a free-homestead policy for the Canadian prairies that, in conjunction with the completion of the Canadian Pacific Railway and the launching of other railway lines, brought wave after wave of settlers into the northwest in such numbers as to justify the creation of Saskatchewan and Alberta in 1905 out of the portion of the Northwest Territories south of the 60th parallel of north latitude. Although provision for their entry was included in the BNA Act, 1867, Prince Edward Island held back from the Union until 1873 and Newfoundland became Canada's tenth province on March 31, 1949 (see Table 3.1).

The Constitution of Canada, which had a corporate beginning in 1867, combines, in a set of rules determining the creation and operation of the machinery or institutions of government, the Cabinet system of responsible government (based on an inheritance from Britain) with a Canadian adaptation of federalism (as then practised in the United States for 80 years). A written document, the BNA Act of 1867, contains a substantial portion of Canada's Constitution and this Act, with its various amendments, is popularly held to be the Canadian Constitution. There is, however, another and perhaps more important part which appears, through the evolutionary processes of historical growth, in various guises including well-established usages and conventions found in the unwritten provisions of the Constitution.

Thus, the BNA Act is not a comprehensive constitutional document presenting an exhaustive statement of fundamental laws and rules by which Canada is governed. The Constitution of Canada in its broadest sense includes other British statutes (such as the Statute of Westminster, 1931) and Orders in Council (notably those admitting various provinces and

territories to the federation), Statutes of the Parliament of Canada relating to such matters as the succession to the Throne, the Royal Style and Titles, the Governor General, the Senate, the House of Commons, the creation of courts, the establishment of government departments, the franchise, elections, and also statutes of provincial legislatures relating to provincial constitutional institutions and government matters. Federal and provincial Orders in Council, legally authorized by their respective statutes, provide further constitutional material as do the decisions of the courts which interpret the BNA Act and all ordinary statutes and indeed possess the power to set aside any laws which they hold to be *ultra vires* or beyond the jurisdiction of the enacting legislative bodies, whether federal or provincial. Moreover, the Canadian Constitution comprises, in addition to the statutory law and its judicial interpretation, substantial sections of the common law, unwritten constitutional usages and conventions and principles of democratic government which were transplanted from Britain over two hundred years ago and since then have been thriving and evolving in the Canadian environment. For example, the Cabinet system of responsible government and its functioning through close identification of the executive and the legislative powers (that is, of the Cabinet and the House of Commons) is not mentioned in the BNA Act but derives from an unwritten convention of the Constitution.

Although the essential principles of Cabinet government are based on custom or constitutional usage, the federal structure of Canadian government rests on the explicit written provisions of the BNA Act. Apart from the creation of the federal union, the dominant feature of the Act and indeed of the Canadian federation was the distribution of powers between the central or federal government on the one hand and the component provincial governments on the other. In brief, the primary purpose was to grant to the Parliament of Canada legislative jurisdiction over all subjects of general or common interest, while giving to the provincial legislatures jurisdiction over all matters of local or particular interest.

Unlike the written constitutions of many nations, the BNA Act lacks comprehensive "bill of rights" clauses, although it does accord specific constitutional protection to the use of the English and French languages (clause 133) and special safeguards with respect to sectarian or denominational schools. Freedom of speech, freedom of assembly, freedom of religion, freedom of the press, trial by jury and similar liberties enjoyed by the individual citizen are not recorded in the BNA Act but rather depended on the statute law and the common law inheritance until these rights were confirmed by the passage of a Canadian Bill of Rights — An Act for the Recognition and Protection of Human Rights and Fundamental Freedoms (SC 1960, c.44), assented to August 10, 1960.

The right to use either the English or the French language in the House of Commons, the Senate or the federal courts is constitutionally guaranteed by Section 133 of the BNA Act. The use of the English and French languages in the administration of the Government of Canada is dealt with in the Official Languages Act (RSC 1970, c.O-2). That Act provides that government notices to the public, certain orders and regulations, and final decisions of federal courts are to be made or issued in both languages and that, in the National Capital Region and in federal bilingual districts, government services are to be available in both languages. The Commissioner of Official Languages for Canada is responsible for ensuring that the Act is complied with.

Amendment of the Constitution. No provision was made in the BNA Act of 1867 for amendment thereof by any legislative authority in Canada but both the Parliament of Canada and the provincial legislatures were given legislative jurisdiction with respect to some matters relating to government. Thus, for example, the Parliament of Canada was given jurisdiction with respect to the establishment of electoral districts and election laws and the privileges and immunities of members of the House of Commons and the Senate, and each provincial legislature was empowered to amend the constitution of the province except as regards the office of Lieutenant-Governor. Amendments to the BNA Act have been made on 14 occasions since 1867 by the British Parliament. By an amendment to the BNA Act passed in 1949, the authority of the Parliament of Canada to legislate with respect to constitutional matters was considerably enlarged and it may now amend the Constitution of Canada except as regards the legislative authority of the provinces, the rights and privileges of provincial legislatures or governments, schools, the use of the English or the French language, and the duration of the House of Commons other than in time of real or apprehended war, invasion or insurrection.

The search for a satisfactory amending procedure within Canada which satisfies the need

to safeguard basic provincial and minority rights and yet possesses sufficient flexibility to ensure that the Constitution can be altered to meet changing circumstances has been the subject of repeated consideration in the Parliament of Canada as well as in a series of formal federal-provincial conferences and meetings in 1927, 1935-36, 1950 and 1960-61. In 1964 the text of a draft Bill "to provide for the amendment in Canada of the Constitution of Canada", which embodied the amending procedure or formula recommended by the Conference of Attorneys General, was unanimously accepted by the Conference of the Prime Minister and the Premiers in October of that year. However, Quebec subsequently withdrew its approval of the formula and it was never adopted.

Between February 1968 and June 1971, eight federal-provincial conferences were held on the constitution. A committee of officials was established to provide assistance in the study of constitutional questions. The provincial governments with one exception and the federal government submitted proposals for a new constitution. The discussions culminated in the drafting of the Canadian Constitutional Charter 1971, which set out specific constitutional reforms including a revised amendment procedure. The Charter was considered at the Constitutional Conference in Victoria, BC, in June 1971 but as yet has not been accepted by all governments.

Treaty-making powers. The federal government has exclusive responsibility for the conduct of external affairs as a matter of national policy affecting all Canadians. The policy of the federal government in discharging this responsibility is to promote the interest of the entire country and of all Canadians of the various provinces within the over-all framework of a national policy.

In matters of specific concern to the provinces of Canada, it is the policy of the Canadian government, in a spirit of co-operative federalism, to do its utmost to assist the provinces in achieving the particular aspirations and goals that they wish to attain. The attitude of the federal government in this respect was illustrated by the "entente" signed by representatives of Quebec and France in the field of education in February 1965. Provincial and federal authorities co-operated actively in a procedure that enabled Quebec, within the framework of the Constitution and the national policy, to participate in international arrangements in a field of particular interest to that province.

Thus, under existing procedures, once it is determined that what a province wishes to achieve through agreements in the field of education or in other fields of provincial jurisdiction falls within the framework of Canadian foreign policy, the provinces may discuss detailed arrangements direct with the competent authorities of the country concerned. When a formal international agreement is to be concluded, however, the federal powers relating to the signature of treaties and the conduct of over-all foreign policy must necessarily come into operation.

3.2 Distribution of federal and provincial powers

The most important provisions of the BNA Act relate to the distribution of powers between the federal and provincial governments. Sections 91 and 92 are particularly important:

91. It shall be lawful for the Queen, by and with the Advice and Consent of the Senate and House of Commons, to make Laws for the Peace, Order, and good Government of Canada, in relation to all Matters not coming within the Classes of Subjects by this Act assigned exclusively to the Legislatures of the Provinces; and for greater Certainty, but not so as to restrict the Generality of the foregoing Terms of this Section, it is hereby declared that (notwithstanding anything in this Act) the exclusive Legislative Authority of the Parliament of Canada extends to all Matters coming within the Classes of Subjects next herein-after enumerated; that is to say:

1. The amendment from time to time of the Constitution of Canada, except as regards matters coming within the classes of subjects by this Act assigned exclusively to the Legislatures of the provinces, or as regards rights or privileges by this or any other Constitutional Act granted or secured to the Legislature or the Government of a province, or to any class of persons with respect to schools or as regards the use of the English or the French language or as regards the requirements that there shall be a session of the Parliament of Canada at least once each year, and that no House of Commons shall continue for more than five years from the day of the return of the Writs for choosing the House: Provided, however, that a House of Commons may in time of real or apprehended war, invasion or insurrection be continued by the Parliament of Canada if such continuation is not opposed by the votes of more than one third of the members of such House.

[Note: Added by the British North America Act (No. 2), 1949, 13 Geo. VI, c.81 (U.K.).]

1A. The Public Debt and Property.

[Note: Re-numbered 1A by the British North America Act (No. 2), 1949, 13 Geo. VI, c.81 (U.K.).]

2. The Regulation of Trade and Commerce.

2A. Unemployment insurance.

[Note: Added by the British North America Act, 1940, 3-4 Geo. VI, c.36 (U.K.).]

3. The raising of Money by any Mode or System of Taxation.

4. The borrowing of Money on the Public Credit.

5. Postal Service.

6. The Census and Statistics.

7. Militia, Military and Naval Service, and Defence.

8. The fixing of and providing for the Salaries and Allowances of Civil and other Officers of the Government of Canada.

9. Beacons, Buoys, Lighthouses, and Sable Island.

10. Navigation and Shipping.

11. Quarantine and the Establishment and Maintenance of Marine Hospitals.

12. Sea Coast and Inland Fisheries.

13. Ferries between a Province and any British or Foreign Country or between Two Provinces.

14. Currency and Coinage.

15. Banking, Incorporation of Banks, and the Issue of Paper Money.

16. Savings Banks.

17. Weights and Measures.

18. Bills of Exchange and Promissory Notes.

19. Interest.

20. Legal Tender.

21. Bankruptcy and Insolvency.

22. Patents of Invention and Discovery.

23. Copyrights.

24. Indians, and Lands reserved for the Indians.

25. Naturalization and Aliens.

26. Marriage and Divorce.

27. The Criminal Law, except the Constitution of Courts of Criminal Jurisdiction but including the Procedure in Criminal Matters.

28. The Establishment, Maintenance, and Management of Penitentiaries.

29. Such Classes of Subjects as are expressly excepted in the enumeration of the Classes of Subjects by this Act assigned exclusively to the Legislatures of the Provinces.

And any Matter coming within any of the Classes of Subjects enumerated in this Section shall not be deemed to come within the Class of Matters of a local or private Nature comprised in the Enumeration of the Classes of Subjects by this Act assigned exclusively to the Legislatures of the Provinces.

92. In each Province the Legislature may exclusively make Laws in relation to Matters coming within the Classes of Subjects next hereinafter enumerated; that is to say:

1. The Amendment from Time to Time, notwithstanding anything in this Act, of the Constitution of the Province, except as regards the Office of Lieutenant Governor.

2. Direct Taxation within the Province in order to the raising of a Revenue for Provincial Purposes.

3. The Borrowing of Money on the sole Credit of the Province.

4. The Establishment and Tenure of Provincial Offices and the Appointment and Payment of Provincial Officers.

5. The Management and Sale of the Public Lands belonging to the Province and of the Timber and Wood thereon.

6. The Establishment, Maintenance, and Management of Public and Reformatory Prisons in and for the Province.

7. The Establishment, Maintenance, and Management of Hospitals, Asylums, Charities, and Eleemosynary Institutions in and for the Province, other than Marine Hospitals.

8. Municipal Institutions in the Province.

9. Shop, Saloon, Tavern, Auctioneer, and other Licenses in order to the raising of a Revenue for Provincial, Local, or Municipal Purposes.

10. Local Works and Undertakings other than such as are of the following Classes:-

a. Lines of Steam or other Ships, Railways, Canals, Telegraphs, and other Works and Undertakings connecting the Province with any other or others of the Provinces, or extending beyond the Limits of the Province;

- b. Lines of Steam Ships between the Province and any British or Foreign Country;
- c. Such Works as, although wholly situate within the Province, are before or after their Execution declared by the Parliament of Canada to be for the general Advantage of Canada or for the Advantage of Two or more of the Provinces.
- 11. The Incorporation of Companies with Provincial Objects.
- 12. The Solemnization of Marriage in the Province.
- 13. Property and Civil Rights in the Province.
- 14. The Administration of Justice in the Province, including the Constitution, Maintenance, and Organization of Provincial Courts, both of Civil and of Criminal Jurisdiction, and including Procedure in Civil Matters in those Courts.
- 15. The Imposition of Punishment by Fine, Penalty, or Imprisonment for enforcing any Law of the Province made in relation to any Matter coming within any of the Classes of Subjects enumerated in this Section.
- 16. Generally all Matters of a merely local or private Nature in the Province.

Certain important subject matters are not included in Sections 91 and 92. For example, education, which (subject to guarantees provided the Catholic or Protestant minority) falls within the exclusive jurisdiction of the provincial legislatures, is dealt with in Section 93; and agriculture and immigration, over which both levels of government have jurisdiction, are dealt with in Section 95.

3.3 The legal system

3.3.1 Common law and Quebec civil law

With one exception, in all the provinces as well as in the two territories, the legal system derives from the common law system of England. The exception is Quebec where the system has been influenced by the legal developments of France. Quebec has its own Civil Code and Code of Civil Procedure. Over the years, both Canadian common law and Quebec civil law have developed unique characteristics. The body of law changes as society changes. In many of the provinces there are now Law Reform Commissions which have been charged with the function of inquiring into matters relating to the reform of the law having regard to both the statute law and the common law. In Quebec a general revision of the Civil Code is taking place under the auspices of the Civil Code Revision Office. At the federal level there is the Law Reform Commission of Canada whose purpose is "to study and keep under review on a continuing basis the statutes and other laws comprising the law of Canada with a view to making recommendations for their improvement, modernization and reform".

3.3.2 Criminal law

The criminal law of Canada has as its foundation the criminal common law of England built up through the ages and consisting first of customs and usages and later expanded by principles enunciated by generations of judges. There is no statutory declaration of the introduction of English criminal law into those parts of Canada that are now New Brunswick, Nova Scotia and Prince Edward Island. Its introduction there depends upon a principle of the common law itself by which English law was declared to be in force in uninhabited territory discovered and planted by British subjects, except in so far as local conditions made it inapplicable. The same may be said of Newfoundland although the colony dealt with the subject in a statute of 1837. In Quebec, its reception depends upon a Royal Proclamation of 1763 and the Quebec Act of 1774. In each of the other provinces and in the Yukon and Northwest Territories, the matter has been dealt with by statute.

The judicial systems of the provinces as they exist today are based upon the British North America Act of 1867. Section 91 of the Act provides that "The exclusive legislative authority of the Parliament of Canada extends to ... the criminal law, except the constitution of courts of criminal jurisdiction but including the procedure in criminal matters". By Section 92(14), the legislature of the province exclusively may make laws in relation to "the Administration of Justice in the Province, including the Constitution, Maintenance, and Organization of Provincial Courts, both of Civil and Criminal Jurisdiction and including Procedure in Civil Matters in those Courts". The Parliament of Canada may, however (Sect. 101), establish any additional courts for the better administration of the laws of Canada. It should be noted that the Statute of Westminster, 1931 effected important changes, particularly by abrogating the Colonial Laws Validity Act, 1865 (Br.) and confirming the right of a Dominion to make laws having extraterritorial operation.

At the time of Confederation each of the colonies affected had its own body of statutes relating to the criminal law. In 1869, in an endeavour to assimilate them into a uniform system applicable throughout Canada, Parliament passed a series of Acts, some of which dealt with offences of special kinds and others with procedure. Most notable of the latter was the Criminal Procedure Act, but other Acts provided for the speedy trial or summary trial of indictable offences, the powers and jurisdiction of justices of the peace in summary conviction matters and otherwise, and the procedure in respect of juvenile offenders.

Codification of the criminal law through a Criminal Code Bill founded on the English draft code of 1878, Stephen's *Digest of criminal law*, Burbridge's *Digest of the Canadian criminal law*, and the relevant Canadian statutes was brought about by the Minister of Justice, Sir John Thompson, in 1892. This Bill became the Criminal Code of Canada and came into force on July 1, 1893. It must be remembered, however, that the criminal code was not exhaustive of the criminal law. It was still necessary to refer to English law in certain matters of procedure and it was still possible to prosecute for offences at common law. Moreover, Parliament has declared offences against certain other Acts, e.g., the Narcotic Control Act, to be criminal offences.

An examination and study of the criminal code was authorized by Order in Council dated February 3, 1949, and the Commission which had been assigned the task of revising the code presented its report with a draft Bill in February 1952. After coming before successive sessions of Parliament it was finally enacted on June 15, 1954 and the new Criminal Code SC 1953-54, c.51 (now RSC 1970, c.C-34) came into effect on April 1, 1955. Since the new Code came into force a number of important amendments have been made. These include an amendment in 1956 providing that motions for leave to appeal to the Supreme Court of Canada in criminal cases should be heard by a quorum of at least five judges of that Court instead of by a single judge; amendments effected in 1959, providing a statutory extension of the definition of "obscenity" and making provision for seizure and condemnation of offending material without a charge necessarily being laid against any person; extensive amendments relating to the allowing of time for payment of fines; amendments dealing with offences committed in aircraft in flight over the high seas; and an amendment forbidding the publication in a newspaper or broadcast of a report that any admission or confession was tendered in evidence at a preliminary inquiry or a report of the nature of such admission or confession unless the accused has been discharged or, if the accused has been committed for trial, the trial has ended. (In 1969 a new amendment laid down that the accused may apply to the magistrate or justice holding a preliminary inquiry for an order forbidding publication of any of the evidence until the accused has been discharged or the trial itself ended.)

It is most important to note that in 1960 (SC 1960, c.44) Parliament enacted what is known as the Canadian Bill of Rights. Although the Act sets out further details, its general scope appears in Section 1, which reads as follows:

1. It is hereby recognized and declared that in Canada there have existed and shall continue to exist without discrimination by reason of race, national origin, colour, religion or sex, the following human rights and fundamental freedoms, namely, (a) the right of the individual to life, liberty, security of the person and enjoyment of property, and the right not to be deprived thereof except by due process of law; (b) the right of the individual to equality before the law and the protection of the law; (c) freedom of religion; (d) freedom of speech; (e) freedom of assembly and association; and (f) freedom of the press.

Although the Bill of Rights has been invoked on various occasions, the courts have not held it to affect the operation of the criminal code.

In 1961, the offence of murder was divided into capital and non-capital, the death penalty was abolished in relation to the offence of non-capital murder, and the term "criminal sexual psychopath" was dropped and the term "dangerous sexual offender" substituted; in 1965, provision was made for the right to appeal in habeas corpus proceedings.

The concept of "non-capital murder" was introduced into Canadian criminal law in 1961. At that time, capital murder was defined to include, for example, planned and deliberate murder, murder in the course of certain violent acts and murder of peace officers and prison officers. Life imprisonment was substituted for the death penalty in cases where the accused was convicted of non-capital murder.

In 1966 the House of Commons, in a free vote, rejected a Bill under which the death penalty for murder would have been completely abolished. The next year, in 1967, an Act was passed under which the definition of capital murder was restricted to the murder of police officers or prison officers. This Act was brought into force on December 29, 1967, and

continued in force for a period of five years from that day. The Act then expired and the broader definition of capital murder, introduced in 1961, again came into operation.

Some very comprehensive amendments to the criminal code are contained in the Criminal Law Amendment Act which was assented to on June 27, 1969 and, with certain exceptions, came into force on August 26, 1969. Among the changes were amendments relating to gaming and lotteries, "drinking and driving", homosexual acts and therapeutic abortion. It also affected the law relating to the publication of evidence, as mentioned above, and it affected the law relating to the issue of fitness to stand trial on the grounds of insanity.

In 1971 Parliament passed the Bail Reform Act which changed the criminal code by restricting police power of arrest for minor offences and requiring the police, as a general rule, to release persons arrested for minor or less serious offences as soon as possible. In addition, a justice is required to issue a summons unless the public interest requires a warrant of arrest. Save in very exceptional cases "cash bail" was abolished and, as a general rule, a person charged with an offence will be released simply on his written undertaking to attend court.

In 1972 the Criminal Law Amendment Act introduced a wide variety of reforms. Rules regarding jury duty were changed and men and women were made equally eligible and responsible to serve. The possibility of more flexible and appropriate law enforcement was enhanced by providing that individuals accused of certain kinds of crimes, such as obstructing the police, could be tried either by summary conviction or indictment. New offences were created with regard to hijacking and endangering the safety of aircraft, to soliciting for the purpose of prostitution by either male or female and to disturbing the peace of an apartment building. The offences of vagrancy and attempted suicide were abolished. Important changes were introduced with respect to sentencing — maximum sentences were increased for certain crimes connected with the administration of justice, whipping was abolished, and provision was made to permit a judge not to sentence an accused found guilty if the public interest would not be served by sentencing him. Provision was made whereby jail sentences under 90 days could be served at night and on weekends in order that the individual might continue to earn a living and support his family.

3.4 Courts and the judiciary

3.4.1 The federal judiciary

The Parliament of Canada is empowered by Section 101 of the British North America Act from time to time to provide for the constitution, maintenance and organization of a general Court of Appeal for Canada and for the establishment of any additional courts for the better administration of the laws of Canada. Under this provision, Parliament has established the Supreme Court of Canada, the Federal Court of Canada and certain miscellaneous courts.

Supreme Court of Canada. This Court, first established in 1875 and now governed by the Supreme Court Act (RSC 1970, c.S-19), consists of a chief justice, who is called the Chief Justice of Canada, and eight puisne judges. The chief justice and the puisne judges are appointed by the Governor in Council and hold office during good behaviour but are removable by the Governor General on address of the Senate and the House of Commons. They cease to hold office upon attaining the age of 75 years. The Court sits at Ottawa and exercises general appellate jurisdiction throughout Canada in civil and criminal cases. The Court is also required to consider and advise upon questions referred to it by the Governor in Council and it may also advise the Senate or the House of Commons on private Bills referred to the Court under any rules or orders of the Senate or of the House of Commons.

Appeals may be brought from any final judgement of the highest court of final resort in a province in any case where the amount or value of the matter in controversy exceeds the sum of \$10,000. An appeal may be brought from any other final judgement with leave of the highest court of final resort in the province; if such court refuses to grant leave, the Supreme Court of Canada may grant leave to appeal. The Supreme Court may grant leave to appeal from any judgement whether final or not. Appeals in respect of indictable offences are regulated by the criminal code. Appeals from federal courts are regulated by the statute establishing such courts. The judgement of the Supreme Court of Canada in all cases is final and conclusive.

Chief Justice and Judges of the Supreme Court of Canada as at December 31, 1972

Chief Justice of Canada, Rt. Hon. Mr. Joseph Honoré G  rald Fauteux (*Appointed March 23, 1970, first appointed a Judge of the Supreme Court, December 23, 1949*)

Hon. Mr. Justice Douglas Charles Abbott (*Appointed July 1, 1954*)
 Hon. Mr. Justice Ronald Martland (*Appointed January 15, 1958*)
 Hon. Mr. Justice Wilfred Judson (*Appointed February 5, 1958*)
 Hon. Mr. Justice Roland A. Ritchie (*Appointed May 5, 1959*)
 Hon. Mr. Justice Emmett M. Hall (*Appointed November 23, 1962*)
 Hon. Mr. Justice Wishart Flett Spence (*Appointed May 30, 1963*)
 Hon. Mr. Justice Louis-Philippe Pigeon (*Appointed October 6, 1967*)
 Hon. Mr. Justice Bora Laskin (*Appointed March 19, 1970*).

Federal Court of Canada. The Federal Court of Canada was constituted by Act of the Parliament of Canada under Section 101 of the British North America Act, 1867, which, after authorizing the creation of the Supreme Court of Canada, confers on the Parliament of Canada authority to constitute other courts for the better administration of the laws of Canada. The Federal Court of Canada is a court of law, equity and admiralty and it is a superior court of record having civil and criminal jurisdiction (Sect. 3 of the Act). It was established in 1875 as the Exchequer Court of Canada, which it replaced in December 1970 (SC 1970-71, c.1).

The Court has two divisions called the Federal Court — Appeal Division, and the Federal Court — Trial Division. The Appeal Division may be called the Court of Appeal or Federal Court of Appeal (Sect. 4 of the Act). The Court of Appeal consists of the Chief Justice of the Federal Court of Canada and three other judges. The Trial Division consists of the Associate Chief Justice of the Federal Court of Canada and seven other judges. Every judge is an ex officio member of the Division of which he is not a regular member (Sect. 5). In addition to the establishment of full-time judges, an added capacity to cope with the purely judicial work of the Court is provided by the authority to invite retired federally appointed judges to act as Deputy Judges of the Court (Sect. 10). This authority extends also to federally appointed judges who are still in office, but only with the consent of the appropriate Chief Justice or Attorney General. Former District Judges in Admiralty are also Deputy Judges of the Court and their services can be utilized on a limited basis (Sect. 60(3)).

Provision is also made in the Act for quasi-judicial officers called Prothonotaries (Sect. 12). Their duties are defined by the Rules and may be of a judicial nature (Sect. 46(1) (h)). In addition to being taxing-masters, they can, subject to supervision by the Court, deal with interlocutory work, and even take trials in minor matters as the Associate Chief Justice may find expedient in order to ensure the expeditious dispatch of the Court's business.

While all the full-time judges must reside in or near the National Capital Region (Sect. 7), each Division of the Court can sit any place in Canada and the place and time of the sittings must be arranged to suit the convenience of the litigants (Sects. 15 and 16). In addition, there is authority in the statute (Sect. 7(2)) for a rota of judges to provide for a continuity of judicial availability in any place where the volume of work, or other circumstances, makes such an arrangement expedient.

Judges of the Federal Court of Canada as at December 31, 1972

Chief Justice, Hon. Wilbur Roy Jockett (*Appointed June 1, 1971*)

Associate Chief Justice, Hon. Camilien Noël (*Appointed June 1, 1971*)

Court of Appeal Judges: Hon. Jacques Dumoulin (*Appointed June 1, 1971*), Hon. Arthur Louis Thurlow (*Appointed June 1, 1971*)

Trial Division Judges: Hon. Angus Alexander Cattanaach (*Appointed June 1, 1971*), Hon. Hugh Francis Gibson (*Appointed June 1, 1971*), Hon. Allison Arthur Mariotti Walsh (*Appointed June 1, 1971*), Hon. Roderick Kerr (*Appointed June 1, 1971*), Hon. Louis Pratte (*Appointed June 10, 1971*), Hon. Darrel Verner Heald (*Appointed July 9, 1971*), Hon. Frank U. Collier (*Appointed September 16, 1971*)

Deputy Judges of the Federal Court: Hon. Robert S. Furlong, Hon. James D. Higgins, Hon. Harold G. Puddeste, Hon. George Eric Tritchler, Hon. Dalton C. Wells.

Miscellaneous courts. The Railway Act, 1903 (RSC 1970, c.R-2) established the Board of Railway Commissioners for Canada as a court of record; by the Transport Act, 1938 (RSC 1970, c.T-14) the name was changed to the Board of Transport Commissioners for Canada, and by the National Transportation Act, 1967 (RSC 1970, c.N-17) to the *Canadian Transport Commission*. This court exercises jurisdiction with respect to transport matters under the Railway Act and the National Transportation Act, and with respect to telegraph and telephone matters under the Railway Act. The Governor in Council is given jurisdiction to vary or rescind any order of the Commission and an appeal lies from the Commission to the Supreme Court of Canada on a question of jurisdiction or of law.

By virtue of Section 91(21) of the British North America Act, 1867, Parliament has exclusive legislative jurisdiction in relation to bankruptcy and insolvency. By the Bankruptcy Act (RSC 1970, c.B-3) the superior courts of the provinces are constituted *bankruptcy courts*; original jurisdiction is conferred upon the trial courts and appellate jurisdiction is conferred upon the appeal courts of the provinces.

The Tax Review Board, created in 1949 as the Income Tax Appeal Board and later changed to the Tax Appeal Board, now operates under the Tax Review Board Act 1970 (SC 1970-71, c.11). The Board is a court of record and has jurisdiction to hear appeals by taxpayers against their assessment under the Income Tax Act and also appeals under the Estate Tax Act, the Old Age Security Act and certain sections of the Canada Pension Plan. An appeal lies from the Board to the Federal Court of Canada and a further appeal from that Court to the Supreme Court of Canada.

The Court Martial Appeal Court was established in 1959 by an amendment to the National Defence Act (RSC 1970, c.N-4). The judges of the Court are not fewer than four judges of the Federal Court of Canada designated by the Governor in Council and such additional judges of a superior court of criminal jurisdiction as are appointed by the Governor in Council. The Governor in Council designates one of the judges to be president of the Court. The Court hears appeals from courts martial respecting the legality of a finding of guilty on any charge and the legality of a sentence passed by a court martial. An appeal lies from the Court Martial Appeal Court to the Supreme Court of Canada on a question of law only.

The Immigration Appeal Board was established in 1967 by the Immigration Appeal Board Act (RSC 1970, c.I-3). The Board is a court of record, with broad discretionary powers to permit the temporary or permanent admission of individuals, notwithstanding contrary provisions of the Immigration Act. The establishing Act provides for the operation of the Board and in particular for the legal and administrative processes involved in appeals by individuals against deportation, detention and the refusal of admission of sponsored relatives ordered under the provisions of the Immigration Act or Regulations. An appeal lies to the Federal Court of Canada and to the Supreme Court of Canada on leave.

3.4.2 The provincial judiciary

Certain provisions of the British North America Act govern to some extent the provincial judiciary. Under Section 92(14) the legislature of each province exclusively may make laws in relation to the administration of justice in the province including the constitution, maintenance and organization of provincial courts of both civil and criminal jurisdiction. Section 96 provides that the Governor General shall appoint the judges of the superior, district and county courts in each province, except those of the courts of probate in Nova Scotia and New Brunswick.

3.4.3 The territorial judiciary

On April 1, 1971, amendments to the Yukon Act were promulgated into force simultaneously with certain ordinances of the Yukon Territory allowing the Yukon territorial government to assume the administration of justice. Ordinances coming into force that day provided for a Territorial (now Supreme) Court, a Magistrate's Court, justices of the peace and a Court of Appeal. The Supreme Court consists of a single judge of superior court rank and the Magistrate's Court. Both are located in Whitehorse, although from time to time Magistrate's Court sittings are held in other communities. There are 32 justices of the peace, appointed by the Commissioner, located at 15 points in the Territory. The Judge of the Supreme Court of the Northwest Territories is ex officio Judge in the Yukon Territory and vice versa. The Court of Appeal consists of the Chief Justices of British Columbia, the Justices of Appeal of British Columbia and the Judge of the Supreme Court of the Northwest Territories.

The court system in the Northwest Territories consists of a superior court called the Supreme Court of the Northwest Territories, presided over by one judge located in Yellowknife. The Court of Appeal of the Territories consists of the Justices of Appeal of Alberta and the Judges of the Yukon Territory and Northwest Territories Supreme Courts. There are also two full-time magistrates appointed by the Commissioner who have jurisdiction similar to provincial judges; a number of justices of the peace, also appointed by the Commissioner, serve in widely scattered settlements in the Territories.

3.4.4 Salaries, allowances and pensions of judges

Section 100 of the British North America Act provides that the "Salaries, Allowances, and Pensions of the Judges of the Superior, District, and County Courts (except the Courts of Probate in Nova Scotia and New Brunswick) and of the Admiralty Courts in Cases where the Judges thereof are for the Time being paid by Salary, shall be fixed and provided by the Parliament of Canada". These are provided under the Judges Act (RSC 1970, c.J-1 as amended by SC 1970-71, c.55).

The salary of the Chief Justice of Canada is \$47,000 per annum and those of the puisne judges of the Supreme Court of Canada, \$42,000. The salaries of the Chief Justice and the Associate Chief Justice of the Federal Court of Canada are \$39,000 per annum and of the other judges of the Federal Court, \$35,000. The salaries of deputy judges of the Federal Courts, who are judges of other superior courts and were formerly district judges in admiralty pursuant to the Admiralty Act, which was repealed (admiralty jurisdiction now being provided for by the Federal Court Act), are as follows: Ontario, \$1,500 and Newfoundland three judges at \$333.33 each.

All Chief Justices of provincial superior courts and the Associate Chief Justice of the Superior Court of Quebec receive annual salaries of \$39,000; the puisne judges of these courts and the judges of the two territorial courts receive \$35,000 per annum. Where judicial offices are created for supernumerary judges, the incumbents will receive \$35,000 per year. Supernumerary judges are those judges of a superior court of a province who have given up their regular judicial duties to hold themselves available to perform such special judicial duties as may be assigned to them from time to time by the Chief Justice or Associate Chief Justice of the Court of which they are a member. The chief judges of county and district courts receive salaries of \$27,000 per annum and the remaining judges and junior judges of all county and district courts, \$25,000 per annum.

Every judge who is in receipt of a salary under the Judges Act is paid an additional salary of \$3,000 per annum as compensation for any extra-judicial services that he may be called upon to perform by the Government of Canada or the government of a province, and for the incidental expenditures that the fit and proper execution of his office as judge may require. In the case of each judge of the Federal Court of Canada and of the territorial courts of the Yukon Territory and the Northwest Territories an additional allowance of \$2,000 per annum is paid as compensation for special incidental expenditures inherent in the exercise of his office as judge.

The Judges Act provides that a judge of a superior or county court who, for the purpose of performing any function or duty as such judge, attends at any place other than that at which or in the immediate vicinity of which he is by law obliged to reside is entitled to be paid, as a travelling allowance, his moving or transportation expenses and reasonable travelling and other expenses incurred by him in so attending. If a judge uses his personal automobile because of the lack of good public transportation facilities, he is paid a mileage allowance.

Judges' annuities are non-contributory and the statutory retirement age is 75 years except for judges of the Federal Court of Canada who cease to hold office at the age of 70 and judges of the county courts who are compulsorily retired at 70. Those judges of the county courts who held office at the time the retirement age was reduced to 70 years (1971) are not affected by the earlier retirement age but are allowed to serve as judges until they reach 75 years of age, the retirement age in force previously. The Governor in Council may grant an annuity to: a judge who has continued in judicial office for at least 15 years and has attained the age of 65, if he resigns his office; a judge who has continued in judicial office for at least 15 years, if he resigns his office and in the opinion of the Governor in Council the resignation is conducive to the better administration of justice or is in the national interest; a judge who has become afflicted with some permanent infirmity disabling him from the due execution of his office, if he resigns his office or if, by reason of such infirmity, he is removed from office; or a judge who ceases to hold office because he has attained the age of retirement, if he has held judicial office for at least ten years. The amount of the annuity may not exceed two thirds of the salary annexed to the office held at the time of resignation, removal or ceasing to hold office, as the case may be. An annuity granted to a judge commences on the day of his resignation, removal or ceasing to hold office and continues during his natural life.

The Governor in Council may grant to the widow of a judge who dies while in office an annuity not exceeding two ninths of the salary of the judge at the date of his death, to commence immediately after the death of the judge and to continue thenceforth during her

natural life. The Governor in Council may also grant to each of a maximum of four dependent children of a judge who dies while holding office or of a judge who is in receipt of an annuity under the Judges Act, an annuity equal to one fifth of the annuity payable to his widow, or if the judge dies without leaving a widow or such widow is dead, two fifths of the annuity that would have been payable to the judge's widow. Where a judge who was granted an annuity upon his retirement dies, the Governor in Council may grant to the widow an annuity not exceeding one third of the annuity that was granted to him. Two ninths of salary and one third of annuity are the same amount in dollars. An annuity granted to the widow of a judge ceases upon her remarriage. No annuity may be granted if the widow married the judge after he ceased to hold office.

3.5 The legal profession

The adjective "fused" is sometimes used to describe the legal profession in common law Canada since practising lawyers are both called as barristers and admitted as solicitors. Admission to practise is a provincial matter. Statutes setting out the powers and responsibilities of the provincial organizations are: [Alberta] The Legal Profession Act RSA 1970, c.203 as am.; [British Columbia] the Legal Professions Act RSBC 1960, c.214 as am.; [Manitoba] The Law Society Act RSM 1970, c.L-100; [New Brunswick] The Barristers' Society Act, 1931, SNB, 1931, c.50 as am.; [Newfoundland] The Law Society Act RSN 1952, c.115 as am.; [Nova Scotia] Barristers and Solicitors Act RSNS 1967, c.18 as am.; [Ontario] The Law Society Act RSO 1970, c.238; [Prince Edward Island] The Legal Profession Act RSPEI 1951, c.84 as am.; [Saskatchewan] The Legal Profession Act RSS 1965, c.301 as am.; [Northwest Territories] The Legal Profession Ordinance RONWT 1956, c.57 as am.; [Yukon] The Legal Profession Ordinance ROY 1958, c.64 as am. In Quebec the legal profession is divided into the separate branches of advocate and notary and their statutes are the Bar Act, SQ 1966/67, c.77 as am. and the Notarial Act, SQ 1968, c.70.

3.6 Legal aid

For many years the provision of legal services to persons unable to afford the fees normally charged by a lawyer was viewed as a responsibility to be assumed by individual lawyers on a voluntary basis as a form of charity. In more recent times most of the provincial governments have moved to establish publicly funded legal aid programs under which persons of limited means are able to obtain the services of a lawyer in a number of criminal and civil matters at either no cost or modest cost to themselves depending upon the client's financial circumstances. The lawyers who act for clients in matters covered by a provincial legal aid program are then paid by the government, usually at a reduced rate, on a fee for services basis or as a salary depending upon the type of legal aid program operated in the province. The provincial legal aid programs vary considerably in terms of formality, scope of coverage and method of providing the legal services. Some are established by legislative enactment while others exist and operate by way of informal agreements between the provincial government and the law society. Some programs provide for fairly comprehensive coverage in both criminal and civil matters while others at present encompass only criminal offences. Again, some plans operate on a fee for services basis whereas others rely partially or mainly on the services of state salaried lawyers. In some provinces a mixed system is in operation.

In 1971 the federal government entered the field and concluded an agreement with the government of the Northwest Territories for sharing the costs of providing legal aid in both criminal and civil matters for persons in the Territories financially unable to retain the services of a lawyer. This comprehensive legal aid program was implemented on August 17, 1971. In the Yukon Territory the legal aid program is at present a service operated by the territorial bar with the government paying the fees to lawyers who act for legal aid clients charged with criminal offences.

In August 1972, the federal government announced that it was prepared to enter agreements with the provincial governments under which federal funds would be paid to the provinces to assist them in developing or expanding their legal aid programs in matters related to criminal law. Under the agreements, which have now been concluded with the governments of British Columbia, Quebec, New Brunswick, and Nova Scotia, the federal government will contribute up to 50 cents per capita of the provincial population toward the costs of providing lawyers' services to eligible persons subject to criminal charges or proceedings under federal

laws. These federal-provincial agreements enable the provincial governments to determine the method or methods by which legal services will be provided to persons who qualify for assistance, but in cases where an individual is charged with a criminal offence carrying a penalty of capital punishment or life imprisonment that person is entitled to retain a lawyer of his or her own choice. The agreements also ensure that a person otherwise eligible to receive legal aid will not be disqualified as a recipient only because he or she is not a resident of the province in which the criminal proceedings take place.

3.7 Police forces

3.7.1 Organization of police forces

The police forces of Canada are organized in three groups: (1) the federal force, which is the Royal Canadian Mounted Police; (2) provincial police forces — Ontario and Quebec have their own provincial police forces but all other provinces engage the services of the Royal Canadian Mounted Police to perform parallel functions within their borders; and (3) municipal police forces — most urban centres of reasonable size maintain their own police forces or engage the services of the provincial police, under contract, to attend to police matters. In addition, the Canadian National Railways, the Canadian Pacific Railway Company and the National Harbours Board have their own police forces.

The Royal Canadian Mounted Police. The Royal Canadian Mounted Police is a civil force maintained by the federal government. It was established in 1873 as the North-West Mounted Police for service in what was then the North-West Territories and, in recognition of its services, was granted the use of the prefix "Royal" by King Edward VII in 1904. Its sphere of operations was expanded in 1918 to include all of Canada west of Thunder Bay and in 1920 it absorbed the Dominion Police, its headquarters was transferred from Regina to Ottawa and its title was changed to Royal Canadian Mounted Police.

The force now operates under authority of the Royal Canadian Mounted Police Act (RSC 1970, c.R-9). It is responsible to the Solicitor General of Canada and is controlled and managed by a Commissioner who holds the rank and status of a Deputy Minister and is empowered under the Act to appoint members to be peace officers in all provinces and territories of Canada.

The administration of justice within the provinces, including the enforcement of the Criminal Code of Canada, is part of the power and duty delegated to the provincial governments. All provinces, except Ontario and Quebec, have entered into contracts with the Royal Canadian Mounted Police to enforce criminal and provincial laws, under the direction of the respective Attorneys General. In addition, in these eight provinces, the force is under agreement to provide police services to 162 municipalities, thereby assuming the enforcement responsibility of municipal as well as criminal and provincial laws within these communities. The Yukon and Northwest Territories are policed exclusively by the Royal Canadian Mounted Police and therefore criminal offences, federal statutes and all ordinances of the territories fall within the ambit of force responsibility. The force maintains liaison officers in London, Paris, Hong Kong and Washington and represents Canada in the International Criminal Police Organization, which has its headquarters in Paris.

The 12 Operational Divisions, alphabetically designated, make up the strength of the force across Canada; they comprise 41 subdivisions which include 689 detachments. "Headquarters" Division, as well as the Office of the Commissioner, is located at Ottawa. Divisional headquarters, for the most part, are located in the provincial capitals, except for "C" Division which is in Montreal and "A" and "G" Divisions which are in Ottawa. "Air" Division, also with headquarters in Ottawa, supports the Operational Divisions by providing transportation and related services. "N" Division in Ottawa and "Depot" Division in Regina are training divisions.

A teletype system links the widespread divisional headquarters with the administrative centre at Ottawa and a network of fixed and mobile radio units operates within the provinces. The focal point of the criminal investigation work of the force is the Directorate of Laboratories and Identification; its services, together with those of divisional and subdivisional units and of five Crime Detection Laboratories, are available to police forces throughout Canada.

The Canadian Police Information Centre at RCMP Headquarters, a duplexed computer

system, is staffed and operated by the force. Law enforcement agencies throughout Canada have access via a series of remote terminals to information on stolen vehicles, licences, and wanted persons.

The RCMP operates the Canadian Police College at which force members and selected representatives of other Canadian and foreign police forces may study the latest advances in the fields of crime prevention and detection.

As at March 31, 1972 the force had a total strength of 13,726 including regular members, special constables, civilian members and Public Service employees.

Ontario Provincial Police. The Ontario Provincial Police, a Crown force, is the third largest deployed force on the North American continent, having a total authorized strength of more than 5,000 (1972) uniformed and civilian personnel.

The OPP is administered from general headquarters at Toronto by a Commissioner who has the rank and status of a Deputy Minister under the Ministry of the Solicitor General. Other senior executive officers include two Deputy Commissioners and six Assistant Commissioners. The force has two principal sides — Operations and Services — which are administered by the Deputy Commissioner Operations and the Deputy Commissioner Services, respectively. In turn, six divisions at the next level — Field, Traffic, Administration, Staff Services, Special Services, and Personnel — are administered by their respective Assistant Commissioners. Specialized branches under the Special Services Division include Auto Theft, Criminal Investigation, Anti-rackets, Security Intelligence, Criminal Intelligence, Anti-gambling and Liquor Laws Enforcement.

For policing and administration purposes, the province is divided geographically into 17 districts. In the field, there are 186 detachments controlled through 17 district headquarters located at Chatham, London, Burlington, Niagara Falls, Downsview, Mount Forest, Barrie, Peterborough, Belleville, Perth, Long Sault, North Bay, Sudbury, Sault Ste. Marie, South Porcupine, Thunder Bay and Kenora. Twelve municipalities are policed under special contract.

Under provisions of the Ontario Police Act, the force is responsible for: (1) enforcing federal and provincial statutes in those areas that are not required to maintain their own police department; (2) maintaining a traffic patrol on the more than 10,000 miles of King's Highways and 65,000 miles of secondary county and township roads; (3) enforcing the Liquor Licence Act and the Liquor Control Act for Ontario; (4) maintaining a Criminal Investigation Branch and other specialized branches to assist all other forces in the investigation of major crimes; and (5) assisting other forces by providing additional manpower in the event of emergencies.

Under the Staff Services Division, the Central Records and Communications Branch offers 24-hour seven-day-week service to all police departments in Ontario on such matters as criminal records, fingerprint records, missing and wanted persons, dry cleaning and laundry mark identification, and stolen and recovered property lists.

The OPP operates one of the largest frequency-modulation radio networks in the world, with 107 fixed radio stations and more than 1,300 radio-equipped mobile units including motorcycles, marine units and aircraft. It also operates the Ontario Provincial Police telecommunications network connecting all 17 districts as well as other police departments on a local, national and international basis. Extensions to routine police service are provided by canine, SCUBA and marine-bush rescue units strategically located throughout the province and available to other law-enforcement agencies upon request.

In addition to regular constable recruitment, the force has a cadet program permitting qualified young men to make a career in a long-established police force. Ranking officers, from inspector up to and including the Commissioner, receive the Queen's Commission in the same manner as members of the Canadian Armed Forces.

Quebec Police Force. The Quebec Police Force is responsible for order and public safety in the province, and for prevention and investigation of criminal offences and violation of any provincial law.

The province is divided into two almost equal areas: the Montreal Division and the Quebec Division. The Montreal Division has two subdivisions with headquarters in Hull and Montreal as well as the Estrie District composed of six detachments with headquarters in Sherbrooke; the Quebec Division has two subdivisions with headquarters in Chicoutimi and Quebec City as well as the Lower St. Lawrence District made up of three sections operating 20

detachments with headquarters in Rimouski. There are 106 detachments throughout the province — 58 in the Montreal Division and 48 in the Quebec Division. At the end of 1972, the force had 3,872 members including officers, non-commissioned officers and constables, and 794 office workers.

The QPF is under the command of a Director General, aided by four Assistant Directors General and a Controller of Personnel. Each division is headed by a Chief Inspector and each district and subdivision by a commissioned officer having the rank of Inspector.

Municipal police forces. Provincial legislation makes it mandatory for cities and towns to furnish adequate municipal policing for the maintenance of law and order in their communities. Also, all villages and townships or parts of townships having a population density and a real property assessment sufficient to warrant maintenance of a police force, and having been so designated by Order in Council, are responsible for adequate policing of their municipalities.

3.7.2 Uniform crime reporting

The present method of reporting police statistics (police administration, crime and traffic enforcement statistics), known as the Uniform Crime Reporting Program, was started on January 1, 1962, and was developed by the (then) Dominion Bureau of Statistics in co-operation with the Canadian Association of Chiefs of Police Committee on Uniform Crime Reporting.

As shown in Table 3.2, police personnel in Canada numbered 48,548 at the end of 1970, including 40,295 sworn-in policemen, 7,716 other full-time employees serving as clerks, technicians, artisans, commissionaires, guards, special constables, etc., and 537 cadets. The ratio of police personnel per 1,000 population was 2.3 and the ratio of police was 1.9. Provincial ratios for police personnel ranged from 1.3 to 4.0 per 1,000 persons and for police only from 1.2 to 3.2. In 12 selected metropolitan areas there were 17,124 police personnel including 14,728 police and 2,396 cadets and other full-time employees. Total municipal police personnel numbered 27,472 made up of 25,676 members of municipal forces, 1,750 Royal Canadian Mounted Police and 46 provincial police under municipal contracts.

Three policemen were killed by criminal action during 1970 and six policemen lost their lives accidentally while on duty. Police transport facilities at the end of the year included 8,385 automobiles, 848 motorcycles, 747 other motor vehicles, 431 boats, 22 aircraft, 234 horses and 85 service dogs.

Table 3.3 shows the number of crimes dealt with by the police in 1970, including offences under the criminal code, federal statutes, provincial statutes and municipal by-laws; offences cleared by charge and otherwise; and the number of adults and juveniles charged. Offences reported or known to police but proved unfounded are not shown in the Table but numbered 90,923, including 72,125 under criminal code classifications, 9,993 under federal statutes, 6,487 under provincial statutes and 2,318 under municipal by-laws, except traffic.

During 1970, police reported 90,728 offences committed against the person, including 430 murders, 11,025 rape and other sexual offences, and 78,979 offences of wounding and other assaults (not indecent); all offences against the person resulted in the charging of 32,771 persons, 2,152 of them juveniles. During the year there were 692,878 cases of robbery, theft and other offences against property, resulting in 126,834 persons charged, 37,470 of them juvenile males and 4,015 juvenile females; 67,271 cases of fraud, false pretences, forgery, etc.; 1,887 of prostitution; 1,838 gaming and betting; 6,440 offensive weapons; and 246,407 other criminal code offences. In addition to 36,494 various offences under federal statutes reported, there were 14,071 under the Narcotic Control Act and 4,718 under the controlled drug part of the Food and Drugs Act; these two classifications resulted in the charging of 13,462 persons.

Provincial and territorial fire marshals and commissioners reported 2,539 suspected or known incendiary offences, of which 235 were proved unfounded; 545 offences were reported cleared by charge; charges were laid against 541 adults and 166 juveniles.

The number of motor vehicles stolen was 62,584 (an estimated 736.4 per 100,000 vehicles registered); 56,324 or 90% of these vehicles were recovered. Police were asked to locate 21,758 missing adults and 47,373 missing juveniles; 20,471 adults and 46,630 juveniles were found. The number of drownings reported by police was 1,395.

During 1970, police departments in Canada reported 142,486 (1969, 110,734) criminal code traffic offences, resulting in 100,154 (70,208) persons charged, 2,540 (1,765) of them

females. Total charges reported under federal statutes numbered 3,980 (6,148), provincial statutes 1.8 million (2.0 million) and municipal by-laws 412,261 (387,397), excluding parking violations; the latter numbered 5.4 million (4.9 million), most of them reported by municipal police. There are certain traffic offences under provincial statutes which are almost identical to those under the criminal code. These are shown separately for 1970 in Table 3.4.

The number of traffic accidents reported was 544,088 (543,199), of which 4,483 (4,644) involved fatalities, 122,816 (116,935) resulted in injuries and 416,789 (421,620) involved property damage of over \$100. There were 5,660 (5,543) persons killed in traffic accidents, including 4,201 (4,098) drivers and passengers, 1,210 (1,225) pedestrians, 174 (187) cyclists and 75 (33) others; persons injured numbered 180,633 (173,845).

3.8 Crime and delinquency

3.8.1 Adult offenders and convictions

Offences may be classified under two headings, "indictable offences" and "offences punishable on summary conviction". Indictable offences are grouped in two main categories: offences that violate the criminal code and offences against federal statutes. These include the more serious crimes. Offences punishable on summary conviction — those not expressly made indictable — include offences against the criminal code, federal statutes, provincial statutes and municipal by-laws. Increases in the total number of summary conviction offences do not measure adequately the increase in the seriousness of crime. Many summary conviction offences amount to mere disturbances of the peace, minor upsets to public safety, health and comfort such as parking violations, intoxication, practising trades without licence. Nevertheless, summary conviction offences may include more serious charges such as assault and contribution to juvenile delinquency.

Adults convicted of indictable offences. Statistics are available for persons convicted of indictable offences. Thus it is possible to determine the population engaged in prohibited activities and to help in the treatment of anti-social behaviour in terms of subject-centred action. In the present counting system, although individuals may be charged with more than one offence, only one offence is tabulated for each person and is selected according to the following criteria: (1) if the person were tried on several charges, the offence is that for which proceedings were carried to the farthest stage — conviction and sentence; (2) if there were several convictions, the offence is that for which the heaviest punishment was awarded; (3) if the final result of proceedings on two or more charges were the same, the offence is the more serious one, as measured by the maximum penalty allowed by the law; (4) if a person were prosecuted for one offence and convicted of another — for example, charged with murder and convicted of manslaughter — the offence is the one for which the person was convicted.

In 1970 there were 51,866 adults charged with 86,597 indictable offences of whom 45,880 were found guilty of 75,334 offences (see Table 3.5). All data for 1969 and 1970 exclude returns for Quebec and Alberta. It should be noted that figures given in Tables 3.5-3.16 are based on information received through the provincial judicial systems and consequently cannot be compared with data reported by police under the Uniform Crime Reporting Program (Tables 3.2-3.4) which include these two provinces.

Table 3.6 classifies indictable offences by type of offence for 1969 and 1970. Class I covers offences against the person and in 1970, 5,560 males and 355 females were convicted in this category, mostly for assaults of various kinds. Classes II to IV deal with offences against property. Thefts predominate among the offences in these classes, and breaking and entering, extortion and robbery — serious crimes which involve acts of violence — are the next most numerous. Class V deals with offences relating to currency and Class VI with miscellaneous offences; among the latter, the most numerous convictions are for offences connected with gaming, betting and lotteries. In 1970, 1,972 men and 222 women were convicted under federal statutes of whom 1,556 men and 187 women were offenders under the Narcotic Control Act.

The number of female offenders convicted of indictable offences increased from 5,067 in 1969 to 6,997 in 1970 with Ontario accounting for 3,878 and British Columbia for 1,535 of the total. The ratio of female offenders convicted to total persons convicted increased from 13.3% in 1969 to 15.3% in 1970; the increases ranged from 4.2% in Prince Edward Island to 16.9% in British Columbia. Table 3.7 summarizes the most serious court sentences given for indictable offences, and Table 3.8 shows the method of trial and disposition of cases.

Two kinds of sentences — probation and commitment to an institution — maintain, for a certain period of time, a relationship between the person dealt with by the court and the legal institutions of a community. There are several types of institutions to which a person can be committed, such as penitentiaries, reformatories, jails and industrial farms. Theoretically, every institution has a specific purpose which is supposed to be taken into account when arriving at a legal decision. In practice, however, the availability of an institution in a given community is a factor in determining the decision rendered by the court.

Young adult offenders (16-24 years). Attention is focused on the needs of the young adult offenders, 16-24 years of age, who constitute a promising group for rehabilitation in modern reception and diagnostic centres equipped with educational, trade training and other formative disciplines. The young men and women in this age group accounted for 23.4% of the total population 16 years of age or over in 1968 but they formed over half of the criminal population committing indictable offences. The group includes some of the most daring offenders, who already may be experienced criminals, as well as first offenders likely to be turned from crime by further education and training. There were 23,118 young adult offenders in 1970, an increase of 19.1% over the previous year (see Tables 3.9 and 3.10).

Convictions for summary conviction offences. Offences punishable on summary conviction under the criminal code or under the provincial summary conviction Acts as the case may be, are triable by magistrates and justices of the peace. Data relating to these offences are based on convictions; no information is available on either the number of persons involved in these offences or the number of charges (see Table 3.11).

Appeals. Appeal is an important safeguard in Canada's legal system. The conviction or the sentence pronounced by a judge of a first instance court may be appealed on the grounds that the verdict was unreasonable, that there was a wrong decision on some question of law or that there was a miscarriage of justice. In 1970 there were 2,910 appeals in indictable cases disposed of by the courts, of which 410 were Crown appeals and 2,500 appeals of the accused. Of the Crown appeals, 65 were from acquittal and 345 from sentence. Appeals in summary conviction cases disposed of by the courts numbered 1,727 in 1970. Of these, 337 were appeals of the informant and 1,390 appeals of the accused. The informant appeals comprised 262 from acquittal and 75 from sentence, and appeals of the accused comprised 1,129 from conviction and 261 from sentence.

3.8.2 Juvenile delinquents

Juvenile delinquent, as defined in the Juvenile Delinquents Act, means any child who violates any provision of the criminal code or of any federal or provincial statute, or of any by-law or ordinance of any municipality, or who is guilty of sexual immorality or any similar form of vice, or who is liable by reason of any other act to be committed to an industrial school or juvenile reformatory under the provision of any federal or provincial statute. The commission by a child of any of these acts constitutes an offence known as a delinquency. The upper age limit of children brought before the juvenile courts in the provinces varies. The Act defines a child as meaning any boy or girl apparently or actually under the age of 16 years, or such other age as may be directed in any province. In Prince Edward Island, Nova Scotia, New Brunswick, Ontario and Saskatchewan under 16 is the official age; in Alberta under 16 for boys and under 18 for girls; in Newfoundland under 17; in Quebec, Manitoba and British Columbia under 18 years. Up to 1967, it was the practice of Statistics Canada to publish information about juvenile delinquents 16 years of age or over separate from that of juveniles under 16 years of age. From 1967 on, the figures include all those considered as juveniles by the respective provinces, regardless of the differing upper age limits.

Included in the statistics of juvenile delinquents (Tables 3.12-3.16) are cases (alleged as well as adjudged) which were brought before the courts and dealt with formally. A case was counted separately each time a child appeared before the court for a new delinquency or delinquencies. In instances where multiple delinquencies were dealt with at one court appearance, only one delinquency — the most serious — was selected for tabulation. Delinquencies reported as informal cases by the courts were not included nor were cases of children presenting conduct problems which were not brought to court or which were dealt with by the police, social agencies, schools or youth-serving agencies. Thus, community facilities for dealing with children's problems may have an influence on the number of cases

referred to court and, therefore, an effect on the statistics of juvenile delinquents.

Figures from 1969 in Tables 3.12-3.14 exclude those for Manitoba because of the initiation of a revised reporting program in that province. Statistics for Manitoba are given separately in Tables 3.15 and 3.16; a description of the change is given below. In 1971 Alberta also revised its juvenile court reporting program and Tables 3.12-3.14 exclude those for Alberta for that year. Table 3.16 includes statistics for Alberta for 1971.

Delinquents in Manitoba. Manitoba initiated a revised reporting program for delinquency in 1969. Basically, there are three groups of figures included in the new program: (1) those showing juveniles involved in judicial, non-judicial and no-contact procedures where the juvenile is counted only once in the year; (2) a count of all delinquencies recorded during the year; and (3) a group of all delinquencies against the Highway Traffic Act, including a duplicate count of juveniles who have more than one charge against them and regardless of the number of appearances at court. The information on informal or non-judicial and no-contact cases, under (1), was previously unreported.

In 1970, 5,573 juveniles were charged with delinquencies in Manitoba. Of this number 2,037 were found delinquent, 42 were freed with no action, 24 were dismissed, 926 had their cases adjourned, 26 were referred to adult court, and 2,518 were dealt with informally. The disposition of sentence for those found delinquent was: reprimand, 162; indefinite detention, 2; probation, 1,041; fine or restitution, 428; training school, 89; mental hospital, 1; suspended disposition, 265; and suspended driver's licence, 49.

Delinquents in Alberta. Alberta initiated a revised reporting program for delinquency in 1971. Basically, there are two groups of figures included in the new program: (1) those showing juveniles involved in delinquencies who are counted only once in the year; and (2) a count of all delinquencies recorded during the year.

3.9 Correctional institutions

Correctional institutions may be classified under three headings: (1) training schools — operated by the provinces or private organizations under provincial charter for juvenile offenders serving indefinite terms up to the legal age for children in the particular province; (2) provincial adult institutions; and (3) penitentiaries — operated for adult offenders by the federal government in which sentences of over two years are served.

3.9.1 Institutions and training schools

There is a limited amount of statistical information available with respect to correctional institutions (see Table 3.17). "In-custody" figures shown in Table 3.18 for penitentiaries refer only to those persons under sentence, but the figures for admissions include those received from courts as well as by transfer from other penitentiaries and by cancellation of paroles. Figures for releases include expiry of sentences, transfers between penitentiaries, releases on parole, deaths, pardons and releases on court order. In-custody figures for provincial and county institutions may include, in addition to those serving sentences, persons awaiting trial, on remand for sentence or psychiatric examination, awaiting appeal or deportation, any others not yet serving sentence and, for training school population, juvenile on placement.

Population figures in Tables 3.17 and 3.18 are for a given day of the year. These figures represent, in effect, a yearly census of correctional institutions and, as such, are not indicative of the daily average population count. For instance, if an abnormal number of commitments is made to a certain institution on or just prior to the end of the year, the result will be an unrepresentative population total for the institution in that year.

With regard to the fluctuations that might have occurred during the year between census days, the total population of correctional institutions has shown a general increase, however, totals for each type of institution have shown a tendency to level off. The marked decline in training school population is due to the closing of training schools in some provinces.

3.9.2 The Canadian Penitentiary Service

The Penitentiary Service operates under the Penitentiary Act (RSC 1970, c.P-6) and is under the jurisdiction of the Solicitor General of Canada. It is responsible for all federal penitentiary institutions and for the care and training of persons sentenced or committed thereto.

The Commissioner of Penitentiaries, under the direction of the Solicitor General, has

control and management of the Service and all matters connected therewith. In the year ended March 31, 1972 the federal penitentiary system consisted of 7 maximum security institutions, 9 medium security, 12 minimum security and 20 specialized institutions.

Maximum security institutions receive inmates sentenced by the courts to imprisonment for terms of from two years to life. These are located at Dorchester, NB; Ville de Laval and Ste. Anne des Plaines, Que.; Kingston and Millhaven, Ont.; Prince Albert, Sask.; and New Westminster, BC. The maximum security institutions at Ste. Anne des Plaines and Millhaven were constructed as part of a plan to gradually abandon the St. Vincent de Paul and Kingston penitentiaries.

Medium and minimum security institutions and correctional camps receive inmates transferred from the maximum security institutions on the basis of their suitability for special forms of training including vocational training. Medium security institutions are located at Springhill, NS, Ville de Laval, Que., Cowansville, Que., Collins Bay and Joyceville near Kingston, Ont., Campbellford, Ont., Stony Mountain, Man., and Drumheller, Alta. Minimum security institutions are located as follows: farm annexes at Dorchester, NB, Joyceville and Collins Bay, Ont., Stony Mountain, Man., Prince Albert, Sask.; minimum security institutions at Ville de Laval and Ste. Anne des Plaines, Que., Millhaven, Ont.; correctional camps at Agassiz, BC, Beaver Creek near Gravenhurst, and Landry Crossing near Petawawa, Ont.; and the William Head Institution at Metchosin, BC. The Penitentiary Service operates specialized institutions located as follows: the Correctional Development Centre at Ville de Laval, Que., for the treatment of special cases and the training of staff; the Regional Medical Centre at Ville de Laval, Que.; the Regional Reception Centre at Ste. Anne des Plaines, Que.; the Matsqui Institution for the treatment of narcotic addicts and the Regional Medical Centre at Abbotsford, BC; the Mountain Prison near Agassiz, BC, for older male recidivists; the Prison for Women, the Regional Medical Centre and the Regional Reception Centre at Kingston, Ont.; and the following community correctional centres: the Parr Town Centre at Saint John, NB; the Carleton Centre at Halifax, NS; the St. Hubert Centre at Montreal, Que.; the Portsmouth Centre at Kingston, Ont.; the Montgomery Centre at Toronto, Ont.; the Osborne Centre at Winnipeg, Man.; the Oskana Centre at Regina, Sask.; the Crieson Centre at Edmonton, Alta.; the Scarboro Centre at Calgary, Alta.; the West Georgia Centre and the Burrard Centre at Vancouver, BC.

Some inmates sentenced to penitentiary terms in Newfoundland are held in the provincially operated centres at St. John's under the provisions of Section 14 of the Penitentiary Act.

Headquarters of the Penitentiary Service is located at Ottawa and regional directorates are located in Vancouver, BC, Kingston, Ont., and Ville de Laval, Que., for the western, Ontario and Quebec areas, respectively. Three correctional staff colleges — at Kingston, Ville de Laval and New Westminster — are operated for the training of recruits, and for refresher courses for senior penitentiary officers. These staff colleges also provide excellent facilities for Service-wide conferences of institutional heads and other special groups of officers.

As at March 31, 1972, 36% of the inmates were in maximum security institutions, 51% in medium security and 13% in minimum security. New institutions have been carefully designed to provide facilities for the rehabilitation of their inmates. All afford space for both indoor and outdoor recreation. Some of the old institutions are being brought up to date to meet present-day needs and others are being phased out.

Every inmate enters the federal penal system through a regional reception centre or a receiving institution. The prime purpose of the reception centre is to allow a complete diagnosis of each individual inmate and, based upon the results of that diagnosis, to place the inmate in the institution within the system that would provide the best mix of training program and degree of security needed in each case. Facilities provide for admission in one of three categories: age 21 years and younger, age 22 years and older and first offenders, and, recidivists. Young or first offenders are segregated from the recidivists. Doctors, psychologists, and social workers examine them from the viewpoint of physical and mental health, abilities, training and need for schooling in order to launch them on a rehabilitation program. The program of the correctional services is directed primarily toward assisting the inmate in every possible way to regain his proper place in society. Better facilities to achieve this are constantly becoming available and the staff involved in the process is highly dedicated. Academic

opportunities are provided and inmates attend classes on either a full-time or part-time basis. Other students advance their education by correspondence courses offered at the elementary, secondary or university level. In 1971-72, approximately 3,500 inmates participated in adult education and vocational training programs offered by the Penitentiary Service, often with a view to acquiring a trade or profession. Expanded use was made of day parole and temporary absence in order to enable students to attend community education facilities. Fifty inmate-students were attending university, high school or community colleges at year-end. Religious programs are provided for all inmates and from 20% to 50% of them participate in worship services. Most chapels run multi-purpose chapel programs during the week where, besides religious instruction, other activities related to religious services are carried out. There is active inmate involvement in this section of the program which also includes suitable community participation.

Plans have been finalized to introduce interdisciplinary teams to be responsible for groups of inmates on a living unit basis in additional institutions besides the five originally selected as pilot institutions. The Living Unit Concept is an attempt to personalize the contacts between staff and inmates, to activate interpersonal relationships so that inmates, many of whom have regarded authority — whether inside or outside institutions — as antagonistic, can learn how to relate to it. This concept breaks down the inmate population into smaller groups with assigned staff, and facilitates the development of interpersonal relationships. The living unit training program will be conducted on a continuing basis as additional institutions are designated as "Living Unit Institutions". The training program for living unit officers is scheduled to keep up with the demand in order that training will occur immediately following the competitive and/or selection process. The program cannot function properly without establishing simultaneously adequate and indispensable security teams. The principles of the living unit cannot be implemented successfully without clearly dividing responsibilities between Security and Living Unit Officers. Therefore, each institution will have its own security force. The separation into two groups of correctional officers will help in providing better specialized training, more frequent and effective staff meetings and over-all improved security control.

Temporary absences continue to increase and during the 1971-72 fiscal year exceeded 35,000. Such leaves are granted for periods of up to three days by the institutional staff and up to 15 days by the Commissioner for humanitarian, rehabilitative and medical reasons. The failure rate of this program was a fraction of one percent.

A sound and healthy program of evening and weekend activities has been expanded over the past year. Eighteen citizen participation committees, comprising 150 citizens, operate in institutions. More than 1,500 citizen volunteers are involved in inmates' programs both institutional and community oriented. A number of those involved are ex-inmates who are responsible for organizing their own groups in consultation with institutional authorities. The programs include Alcoholics Anonymous, drama, singing, music instruction, guitar groups, public speaking lectures, films, sports and recreation as well as a diversified and varied assortment of discussion groups run by private agencies, professional, voluntary citizens and community groups.

An inmate in need of professional treatment or counselling receives such services from staff specialists serving an inmate population of about 7,800. There are 20 full-time physicians and 5 on contractual arrangements or part-time; 19 full-time dentists and 3 part-time; 10 psychiatrists on permanent strength, 15 on contract or part-time; 28 full-time psychologists, 10 part-time; and 125 classification officers and social workers.

3.9.3 The national parole system

Parole is a means by which an inmate in any correctional institution in Canada, if he gives definite indication of his intention to reform, can be released to finish his sentence in the community. The purpose of parole is the protection of society through the rehabilitation of the inmate. The true purpose of corrections should be the reformation of the offender and not merely vengeance or retribution. Nevertheless, the National Parole Board is as much concerned with the protection of society as with the reformation of the offender and supervision is as much a part of the parole system as is guidance. The Board selects those inmates who show sincere intention to reform and assists them in doing so by granting parole.

The inmate then is allowed to serve the remainder of his sentence in society, but under supervision, subject to certain restrictions and conditions. The Board is not a reviewing authority and is not concerned with the propriety of the conviction or the length of the sentence; this is the function of the court. Nor is parole granted for clemency or mercy.

The National Parole Board is composed of a chairman and eight other members. It has jurisdiction for parole over any adult inmate of any prison in Canada who was convicted of an offence against an Act of the Parliament of Canada and has authority to revoke or suspend any order made under the criminal code prohibiting any person from operating a motor vehicle. It has no jurisdiction over a child under the Juvenile Delinquents Act, or an inmate serving a sentence for a breach of a provincial statute, such as a liquor control Act.

Through the Parole Act, the National Parole Board is involved in the pardon granting process under the Royal Prerogative of Mercy, when asked to do so by the Solicitor General of Canada. This concerns free pardons, ordinary pardons, and remissions of fines, forfeitures, or penalties. Under the Criminal Records Act (RSC 1970, c.12, 1st Supp.) the Board also has specific responsibilities for investigations and recommendations concerning pardons of people who were convicted and subsequently rehabilitated. Under that Act a pardon may be granted two years after the end of a sentence for a summary offence or five years after a sentence for an indictable offence.

A person is sent to a federal institution if his sentence of imprisonment is two years or more, or to a provincial institution if his sentence is less than two years. All inmates can become eligible to apply for parole and need not obtain the services of a lawyer to do so. The date of parole review, to grant or refuse parole, for an inmate in a federal penitentiary is set within six months of his entry into the institution. If the sentence is under two years, the inmate is eligible for parole after one third of the sentence is served; if the sentence is two years or more, the inmate is eligible after one third of the sentence is served or after four years, whichever is less, although he must serve at least nine months of his sentence. The Board has the authority to grant an earlier release in exceptional circumstances where the case is deserving and where the best interests of the community and the inmate will be served. Where the sentence is for life, eligibility comes after seven years. If the inmate is serving a life sentence where the death sentence has been commuted, or a life sentence as a minimum punishment, parole cannot be granted until ten years of the sentence have been served; in both cases consent for parole must be given by the Governor in Council.

Unless an inmate advises the Board in writing that he does not want parole, the Board will review his case every two years, whether he applies or not, until he is either granted parole or his sentence is served. However, once eligible for parole, the inmate may apply at any time. An inmate in a provincial institution must either apply or have someone apply on his behalf. When an application is received an investigation lasting about four months is begun and the results presented to the Board for decision. In addition, a representative of the Board interviews the inmate.

The decision of the Board about any one inmate is based on reports it receives from the police, from the trial judge or magistrate and from various people at the institution who deal with him. Reports are also obtained, when available, from a psychologist or a psychiatrist and, if necessary, a community investigation is conducted to secure as much information as possible about his family and background, his work record and his position in the community. From these reports, an assessment is made to determine whether or not he has changed his attitude and is likely to lead a law-abiding life.

When all the reports are received and the community investigation completed, they are analyzed and presented to the Board for consideration. Parole for inmates in provincial institutions is granted or refused on the basis of these reports and investigations. For the inmate in a federal institution there is one more step before the Board makes its decision. He is interviewed by a panel of two or more Board members before his parole eligibility date to clarify or amplify his reasons for requesting parole and other aspects of his case that may have come to light through the reports and investigations.

A person on parole is under the care of a supervisor in one of the Board's 34 district offices, an after-care agency worker, or a probation officer. If he violates the conditions of his parole or commits a further offence or misbehaves in any manner, the Board may suspend or revoke his parole and return him to the institution to serve the part of his sentence that was

outstanding at the time his parole was granted. If a parolee commits an indictable offence, his parole is automatically forfeited and he is returned to the institution to serve the unexpired balance of his sentence plus any new term to which he is sentenced for the commission of the new offence. The district representative may also issue a Warrant of Suspension and have a parolee placed in custody if it is necessary to prevent a breach of any term or condition of the parole. These officers are thus able to exercise effective and adequate control over all parolees in their respective areas.

During the 14 years of its operation, up to December 1972, the Parole Board granted parole (of all types) to 44,471 inmates. During the same period, 6,874 parolees were returned to prison; 2,539 paroles were revoked for misbehaviour or the commission of a minor offence, and 4,335 paroles were forfeited for the commission of an indictable offence. In 1972 the Board granted 4,869 paroles of all types; 442 were revoked and 1,041 forfeited.

¹ The area of Ontario was extended by the Ontario Boundaries Extension Act, 1912 (SC 1912, c. 40).

² Extended by Quebec Boundaries Extension Act, 1912 (SC 1912, c. 45) and diminished Mar. 1, 1927 in consequence of the Award of the Judicial Committee of the British Privy Council whereby approximately 112,000 sq miles of territory (formerly considered as part of Quebec) was assigned to Newfoundland.

³ Extended by the Extension of Boundaries Act of Manitoba, 1881 and the Manitoba Boundaries Extension Act, 1912 (SC 1912, c. 32).

⁴ Saskatchewan and Alberta created as provinces in 1905 from the area formerly comprised in the provisional districts of Assiniboia, Athabaska, Alberta and Saskatchewan established May 17, 1882 by minute of Canadian Privy Council concurred in by Dominion Parliament and Order in Council, Oct. 2, 1895.

⁵ By an Imperial Order in Council passed on June 23, 1870 pursuant to the Rupert's Land Act, 1868 (Br. Stat. 1868, c. 105), the former territories of the Hudson's Bay Company known as Rupert's Land and the North-Western Territory were transferred to Canada effective July 15, 1870. These territories were designated as the North-West Territories by the Act of SC 1869, c. 3, and as the Northwest Territories by RSC 1906, c. 62. By Imperial Order in Council of July 31, 1880 (effective Sept. 1, 1880), all British territories and possessions in North America not already included within Canada and all islands adjacent thereto (with the exception of the Colony of Newfoundland and its dependencies) were annexed to Canada and these additional territories were formally included in the North-West Territories by SC 1905, c. 27. The province of Manitoba was formed out of a portion of the territories by the Manitoba Act, 1870 (SC 1870, c. 3) and a further portion was added to Manitoba in 1881 by SC 1881, c. 14. The provinces of Alberta and Saskatchewan were formed out of portions of the territories in 1905 and in 1912 other portions were added to Manitoba, Ontario and Quebec.

⁶ By SC 1876, c. 21, a separate district to be known as the District of Keewatin was established and provision was made for the local government thereof. The Act was expressed to come into force by proclamation. It provided that portions of the District might be re-annexed to the North-West Territories by proclamation; in 1886 a portion of the District of Keewatin was re-annexed and in 1905 the entire Keewatin District was re-annexed. The Act of 1876 was never proclaimed. By Order in Council of May 8, 1882 the provisional districts of Assiniboia, Saskatchewan, Alberta and Athabaska were created for the convenience of settlers and for postal purposes. By Order in Council of Oct. 2, 1895 the further provisional districts of Ungava, Franklin, Mackenzie and Yukon were created. The boundaries of these provisional districts were re-defined by Order in Council of Dec. 18, 1897. Subsequently the Yukon Territory was formed, the provinces of Alberta and Saskatchewan were created and other portions of the territories were annexed to Quebec, Ontario and Manitoba. By Order in Council dated Mar. 16, 1918 (effective Jan. 1, 1920) the remaining portions of the Northwest Territories were divided into three provisional districts known as Mackenzie, Keewatin and Franklin.

⁷ The provisional district of Yukon established in 1895 was created a judicial district of the North-West Territories by proclamation issued pursuant to Sect. 51 of the North-West Territories Act (RSC 1886, c. 50) on Aug. 16, 1897 and, by the Yukon Territory Act (SC 1898, c. 6), was declared to be a separate territory.

3.2 Police personnel, actual strength, 1969 and 1970

Force	1969				1970			
	Police	Cadets	Other full-time employees	Total	Police	Cadets	Other full-time employees	Total
Royal Canadian Mounted Police	9,201	—	2,623	11,824	9,498	—	3,106	12,604

Chapter 4

Government organization

4.1 Organization of the federal government

In any political system there are processes whereby people express their demands to the government; whereby priorities are established among those demands and policies formulated for their implementation; and, finally, whereby the policies are implemented. The institutions, both governmental and non-governmental, through which these processes are carried on vary from country to country and tend to evolve over time, so that in any given country the roles of the institutions in such processes also change over time. This Section describes the institutions of the Government of Canada and their current roles in the fundamental processes of the Canadian political system.

In most countries, the legal framework within which political processes take place is provided through a constitution. The written Constitution of Canada is embodied in the British North America Acts. The first of these Acts, passed by the British Parliament in 1867, not only established the institutions through which legislative, executive and judicial powers are exercised in Canada but also established a federal form of government. A central government – the federal government – has legislative jurisdiction primarily over matters of national concern and over those matters not otherwise assigned to the provinces. The ten provincial governments are assigned specific areas of legislative jurisdiction, including municipal institutions.

In Canada, there is a fusion of the executive and legislative powers as in Britain. Formal executive power in Canada is vested in the Queen, whose authority is delegated to the Governor General, her representative. Legislative power is vested in the Parliament of Canada which consists of the Queen, an appointed upper house called the Senate and a lower house called the House of Commons, elected by universal adult suffrage. The independence of the judiciary is safeguarded through the constitutional provision that superior court judges are appointed by the Governor in Council (i.e. by the Governor General on advice of the Cabinet) and that they hold office during good behaviour and are removable only by the Governor General on address of the Senate and the House of Commons. In other words, judges cannot be removed unless both Houses of Parliament, the Cabinet and the Governor General agree.

In the Canadian system of government, where the executive is part of Parliament, democratic principles could not be adhered to without the constitutional convention that the government is responsible to the House of Commons. When the government loses the confidence of the House of Commons, it must resign or the Prime Minister must request the Governor General to dissolve Parliament and call a general election. Although there are conventions that help in deciding when the government has lost the confidence of the House, all doubt is removed when the government is defeated on a motion on which it had explicitly staked its life or when a motion of non-confidence in the government is passed. If the government resigns, the Governor General can call on the Leader of the Opposition (who is usually the leader of the political party that has the second largest number of seats in the House of Commons) to form a new government. If a government that has lost the confidence of the House of Commons and is granted a dissolution is defeated in the ensuing general election and if no clear majority is elected, the government has two choices – it can remain in office and seek the confidence of the House of Commons when it meets or it can resign at once. If it resigns, the Governor General will normally ask the leader of another party, usually the one that has won the most seats, to form a new government. The primary responsibility of the Governor General in either circumstance is to provide the nation with a government capable of carrying on with the support of the House of Commons.

The Prime Minister and his Cabinet, who with one or two exceptions are members of the House of Commons, are, formally speaking, the Queen's advisers. In fact, there are virtually no significant actions that can be taken by the Queen, or her representative in Canada, the Governor General, without the advice of the Cabinet. The Prime Minister and his Cabinet determine executive policies and are responsible for them to the House of Commons. The Queen and her representative, the Governor General, have the traditional rights to be consulted, to encourage and to warn the government.

The demands of Canadian citizens are directed primarily to members of Parliament, directly to Cabinet Ministers or indirectly to Cabinet Ministers through the Public Service. These demands may originate from individuals, political parties or pressure groups; members of Parliament, Cabinet Ministers and public servants may take the initiative in suggesting the adoption of policies and programs in the public interest. Although the roles performed by Parliament, the Public Service and the Cabinet cannot be defined with absolute precision, the following stylized description deals with the most obvious and primary roles of each in the Canadian political system.

The determination of public policy rests with the Cabinet but begins generally with the formulation of policy by the individual Ministers. In practice this usually means that public servants under the direction of a Minister formulate policy proposals which he then submits, if he agrees, to his colleagues in the Cabinet. The Cabinet studies the policies submitted and chooses those it wishes to implement. The Cabinet may itself formulate policies, but it may also decide to select a policy from among the alternatives submitted. The establishment of a Cabinet committee system that operates on a functional basis and, more especially, the establishment of the Cabinet Committee on Priorities and Planning represent attempts to enhance the capacity of Cabinet in its primary role of policy determination and priority setting.

In conformity with the concept of the rule of law, all executive acts must be authorized by law, and laws are enacted by Parliament. Executive acts may be carried out under a statute which specifies how a policy is to be implemented, or under a statute which authorizes the Governor in Council to undertake specific acts. Much of the activity of the Public Service is authorized through the yearly enactment of Appropriation Acts authorizing the expenditure of public funds for specific purposes. In terms of the operations of the government, Parliament is concerned primarily with the discussion and authorization of policy submitted for its approval by the government. The approval of these policies is accomplished mainly through the enactment of legislation. In an attempt to enable the House of Commons to perform this role more efficiently, the government introduced numerous changes in the rules of procedure. Adopted in February 1970, they are included in the Standing Orders of the House of Commons.

The most significant feature of these processes is that Cabinet Ministers, who constitute the government, have seats in Parliament and thus share in the exercise of the legislative power. In fact, the majority of legislation enacted by Parliament is submitted by the government; the Constitution provides that all financial measures must originate in the House of Commons.

The role of the judiciary is to apply the laws enacted by Parliament. In the Canadian system of government, Parliament is supreme. This means, among other things, that the judiciary must apply the law as Parliament has enacted it and cannot declare laws to be unconstitutional if they are within the legislative jurisdiction of Parliament or of the legislature that enacted them.

The administration of legislation and of the government's policies is carried out through a Public Service comprising employees organized as of 1972 in 25 departments of government and a large number of special boards, commissions and Crown corporations or other agencies. Legislation and tradition have combined to develop a non-partisan Public Service, the tenure of whose employees is unaffected by changes in government. The only direct contact between public servants and Parliament occurs when they are called to appear as witnesses before parliamentary committees. On these occasions, public servants do not, by convention, express opinions on public policy but usually appear as experts and to explain existing policy. The public servants who head agencies such as the Public Service Commission, the Office of the Auditor General, the Office of the Commissioner of Official Languages, the Library of Parliament or the Office of the Chief Electoral Officer, all of which have a special relationship to Parliament and are not subject to direction by the government on matters of policy, may appear before parliamentary committees to explain the policies of their agencies.

The growth in number, variety and complexity of the demands placed on the government requires it not only to adjust its policies in response to these demands but, with increasing frequency, to make significant changes in the organization of the Public Service so that the required policies can be properly implemented. Major reorganization of the Public Service has been authorized by the passage of Government Organization Acts in 1966, 1969 and 1970.

4.1.1 The Executive

The Crown. The British North America (BNA) Act of 1867 (Sect. 9) provides that “the Executive Government and authority of and over Canada is ... vested in the Queen”. The functions of the Crown (that is, the formal executive represented by the Queen), which are substantially the same as those of the Crown in relation to the British government, are discharged in Canada by the Governor General.

The Sovereign. Since Confederation Canada has had six sovereigns: Victoria, Edward VII, George V, Edward VIII, George VI and Elizabeth II. The present sovereign, Queen Elizabeth, is not only Queen of Canada but of several other countries in the Commonwealth. Her Majesty’s title for Canada was approved by Parliament and established by a Royal proclamation on May 28, 1953: Elizabeth the Second, by the Grace of God of the United Kingdom, Canada and Her other Realms and Territories Queen, Head of the Commonwealth, Defender of the Faith.

The Queen seldom personally discharges the functions of the Crown in respect of Canada except on such occasions as the periodic appointment of the Governor General which is done on the recommendation of the Prime Minister of Canada. On the occasion of a Royal visit, the Queen may participate in those ceremonies that are normally carried out in her name by the Governor General, such as the opening and dissolution of Parliament, the assent to Bills passed by the House of Commons and the Senate, and the granting of a general amnesty.

The Governor General. The Governor General is the representative of the Crown in Canada. The present incumbent, The Right Honourable Roland Michener, is the twentieth Governor General since Confederation and was appointed by Queen Elizabeth on March 29, 1967. Constitutionally, the Queen of Canada is the Canadian head of state but the Governor General fulfils her role in this regard on her behalf. The Letters Patent revised and re-issued under the Great Seal of Canada on October 1, 1947 authorized the Governor General “to exercise on the advice of his Canadian ministers, all Her Majesty’s powers and authorities in respect of Canada”.

Following are the Governors General of Canada since Confederation, with dates of appointment:

The Viscount Monck of Ballytramon, June 1, 1867

The Baron Lisgar of Lisgar and Bailieborough, December 29, 1868

The Earl of Dufferin, May 22, 1872

The Marquis of Lorne, October 5, 1878

The Marquis of Lansdowne, August 18, 1883

The Baron Stanley of Preston, May 1, 1888

The Earl of Aberdeen, May 22, 1893

The Earl of Minto, July 30, 1898

The Earl Grey, September 26, 1904

Field Marshal H.R.H. The Duke of Connaught, March 21, 1911

The Duke of Devonshire, August 19, 1916

General The Baron Byng of Vimy, August 2, 1921

The Viscount Willingdon of Ratton, August 5, 1926

The Earl of Bessborough, February 9, 1931

The Baron Tweedsmuir of Elsfeld, August 10, 1935

Major General The Earl of Athlone, April 3, 1940

Field Marshal The Viscount Alexander of Tunis, March 21, 1946

The Right Honourable Vincent Massey, January 24, 1952

General The Right Honourable Georges P. Vanier, August 1, 1959

The Right Honourable Roland Michener, March 29, 1967.

One of the most important responsibilities of the Governor General is to ensure that the country always has a government. If the office of the Prime Minister becomes vacant because of death, resignation or defeat of the government in the House of Commons, the Governor General must see that the office of the Prime Minister is filled and that a new government is formed.

As the representative of the Queen — one of the three elements of the Canadian Parliament, the others being the Senate and the House of Commons — the Governor General summons, prorogues and dissolves Parliament on the advice of the Prime Minister. He signs Orders in Council, commissions and many other state documents, and gives his assent to Bills

that have been passed in both Houses of Parliament and which thereby become Acts of Parliament with the force of law (unless Parliament prescribes specifically otherwise). Like the Queen, he is bound in virtually all cases to carry out these duties in accordance with the advice of his responsible Ministers. Should he not wish to accept their advice, and should they maintain that advice, his only alternative is to replace the existing government with a new government. This alternative could be exercised only if, at the same time, the principle of responsible government could be upheld. This means that the Governor General's discretion in choosing another government is strictly limited to a situation in which a person other than the existing Prime Minister could command the confidence of the House of Commons.

In Canada, as in other constitutional monarchies, there is a clear division between the executive and representational functions of state. The Prime Minister, as the elected political leader of the country, is the chief executive and head of the government. The Governor General, on the other hand, is not involved in any way in party politics or political affiliation and he is, therefore, in a position to represent Canada as a whole and to speak for Canadians on ceremonial and state occasions. In effect, the Governor General has become an important symbol of the unity of Canada and of the continuity of its institutions and national life.

The Governor General is Canada's host to visiting heads of state and other distinguished visitors from abroad. He extends hospitality of many forms to many Canadians and lends his patronage in support of a great variety of activities throughout the country. The Governor General receives the Letters of Credence of Ambassadors appointed to Canada, receives Commonwealth High Commissioners on appointment and holds investitures for the conferring of honours and awards.

The Privy Council. The BNA Act of 1867 (Sect. 11) provides for "a council to aid and advise in the Government of Canada, to be styled the Queen's Privy Council for Canada...". The Council that in fact advises the Queen's representative, the Governor General, is the Committee of the Privy Council whose membership is identical to that of Cabinet.

Membership in the Privy Council is for life. As at December 31, 1972, there were 132 members, including the 30 Cabinet Ministers of the government of the day, former Cabinet Ministers, various members of the Royal Family, past and present Commonwealth Prime Ministers, Premiers of provinces, former Speakers of the Senate and the House of Commons of Canada and a few distinguished civilians. A member of the Privy Council of Canada is styled "Honourable" and may use the initials "P.C." after his name. A member of the Privy Council of Britain is styled "Right Honourable". The Governor General, the Chief Justice of Canada and the Prime Minister of Canada automatically assume the title "Right Honourable" on assumption of office.

The Privy Council as a whole has met on only a few ceremonial occasions; its constitutional responsibilities to advise the Crown on matters respecting the Government of Canada are discharged exclusively by the Committee of the Privy Council (the Cabinet). The legal instruments through which executive authority is exercised are called Orders in Council. The procedure is for the Committee of the Privy Council to make a submission to the Governor General for his approval which he is obliged to give in almost all circumstances; with this approval, the submission becomes an Order in Council. Meetings of the Committee of the Privy Council or a sub-committee of this Committee are held without formal ceremony.

The office of the President of the Privy Council was originally occupied, more often than not, by the Prime Minister but from time to time, especially in recent years, it has been occupied by another Minister. On July 5, 1968, the Prime Minister explained that the incumbent of the office of President of the Privy Council would also be the Government Leader in the House of Commons, with the broad responsibility of directing the business of the House, including such matters as supervision of the government's replies to questions in the House and of parliamentary returns in general, and also a special responsibility on behalf of the government of ensuring that Parliament, through its operations and organization of business, can effectively discharge its vital role in the Canadian political process under the increasing pressure of modern government.

The following, with the dates when they were sworn in, were members of the Queen's Privy Council for Canada as at December 31, 1972:

Hon. Thomas Alexander Crerar, October 12, 1917
Hon. Henry Herbert Stevens, September 21, 1921

Hon. William Earl Rowe, August 30, 1935
Hon. Colin William George Gibson, July 8, 1940

Members of the Queen's Privy Council (concluded)

- Hon. Joseph Thorarinn Thorson, June 11, 1941
 Rt. Hon. Louis Stephen St. Laurent, December 10, 1941
 Hon. Joseph Arthur Jean, April 18, 1945
 Hon. Lionel Chevrier, April 18, 1945
 Hon. Paul Joseph James Martin, April 18, 1945
 Hon. Douglas Charles Abbott, April 18, 1945
 Hon. Milton Fowler Gregg, September 2, 1947
 Hon. Stuart Sinclair Garson, November 15, 1948
 Hon. Hugues Lapointe, August 25, 1949
 Hon. Gabriel-Édouard Rinfret, August 25, 1949
 Hon. Walter Edward Harris, January 18, 1950
 Hon. George Prudham, December 13, 1950
 Hon. James Sinclair, October 15, 1952
 Hon. William Ross Macdonald, May 12, 1953
 Hon. George Alexander Drew, May 12, 1953
 Hon. John Whitney Pickersgill, June 12, 1953
 Hon. Jean Lesage, September 17, 1953
 Hon. George Carlyle Marler, July 1, 1954
 Hon. Roch Pinard, July 1, 1954
 Hon. Paul Theodore Hellyer, April 26, 1957
 Rt. Hon. John George Diefenbaker, June 21, 1957
 Hon. Howard Charles Green, June 21, 1957
 Hon. Donald Methuen Fleming, June 21, 1957
 Hon. George Hees, June 21, 1957
 Hon. Léon Balcer, June 21, 1957
 Hon. George Randolph Pearkes, June 21, 1957
 Hon. Gordon Churchill, June 21, 1957
 Hon. Edmund Davie Fulton, June 21, 1957

Hon. Jeanne Sauv  , November 27, 1972.

The Prime Minister. The Prime Minister is the leader of the political party requested by the Governor General to form the government, which almost always means that he is the leader of the party with the strongest representation in the House of Commons. His position is one of exceptional authority stemming in part from the success of the party at an election. The Prime Minister chooses his Cabinet. When a member of Cabinet resigns, the remainder of the Cabinet is undisturbed; when the Prime Minister vacates his office, this act normally carries with it the resignation of all those in the Cabinet.

One source of the authority of the Prime Minister lies in his prerogative to recommend the dissolution of Parliament. This prerogative, which in most circumstances permits him to precipitate an election, is a source of considerable power both in his dealings with his colleagues and with the opposition parties in the House of Commons.

Another source of the Prime Minister's authority derives from the appointments which he recommends including Privy Councillors, Cabinet Ministers, Lieutenant-Governors of the provinces, provincial administrators, Speakers of the Senate, Chief Justices of all courts, senators and certain senior executives of the Public Service. The Prime Minister also recommends the appointment of a new Governor General to the Sovereign, although this normally follows consultation with his Cabinet.

Following are the Prime Ministers since Confederation, with dates of administrations:

Rt. Hon. Sir John Alexander Macdonald, July 1, 1867 - November 5, 1873

Hon. Alexander Mackenzie, November 7, 1873 - October 16, 1878

Rt. Hon. Sir John Alexander Macdonald, October 17, 1878 - June 6, 1891

Hon. Sir John Joseph Caldwell Abbott, June 16, 1891 - November 24, 1892

Rt. Hon. Sir John Sparrow David Thompson, December 5, 1892 - December 12, 1894

Hon. Sir Mackenzie Bowell, December 21, 1894 - April 27, 1896

Rt. Hon. Sir Charles Tupper, May 1, 1896 - July 8, 1896

Rt. Hon. Sir Wilfrid Laurier, July 11, 1896 - October 6, 1911

Rt. Hon. Sir Robert Laird Borden, October 10, 1911 - October 12, 1917 (Conservative Administration)

Rt. Hon. Sir Robert Laird Borden, October 12, 1917 - July 10, 1920 (Unionist Administration)

Rt. Hon. Arthur Meighen, July 10, 1920 - December 29, 1921 (Unionist - National Liberal and Conservative Party)

Rt. Hon. William Lyon Mackenzie King, December 29, 1921 - June 28, 1926

Rt. Hon. Arthur Meighen, June 29, 1926 - September 25, 1926

Rt. Hon. William Lyon Mackenzie King, September 25, 1926 - August 6, 1930

Rt. Hon. Richard Bedford Bennett, August 7, 1930 - October 23, 1935

Rt. Hon. William Lyon Mackenzie King, October 23, 1935 - November 15, 1948

Rt. Hon. Louis Stephen St. Laurent, November 15, 1948 - June 21, 1957

Rt. Hon. John George Diefenbaker, June 21, 1957 - April 22, 1963

Rt. Hon. Lester Bowles Pearson, April 22, 1963 - April 20, 1968

Rt. Hon. Pierre Elliott Trudeau, April 20, 1968 - ...

The Cabinet. The Cabinet's primary responsibility in the Canadian political system is to determine priorities among the demands expressed by the people and to define policies to meet those demands. The Cabinet is a committee of Ministers chosen by the Prime Minister, generally from among members of the House of Commons, although one or two Cabinet Ministers are usually chosen from the Senate including the Leader of the Government in the Senate. It is unusual for a senator to head a department of government because the Constitution provides that measures for appropriating public funds or imposing taxes must originate in the House of Commons. If a senator headed a department another Minister in the House of Commons would have to speak on his behalf in respect of its affairs.

As at December 31, 1972, the following were members of the twentieth Ministry:

Prime Minister, Rt. Hon. Pierre Elliott Trudeau

Leader of the Government in the Senate, Hon. Paul Joseph James Martin

Secretary of State for External Affairs, Hon. Mitchell William Sharp

President of the Queen's Privy Council for Canada, Hon. Allan Joseph MacEachen

President of the Treasury Board, Hon. Charles Mills Drury

Members of the twentieth Ministry (concluded)

Minister of Transport, Hon. Jean Marchand
 Minister of Finance, Hon. John Napier Turner
 Minister of Indian Affairs and Northern Development, Hon. Joseph-Jacques-Jean Chrétiens
 Minister of Energy, Mines and Resources, Hon. Donald Stovel Macdonald
 Minister of Labour, Hon. John Carr Munro
 Minister of Communications, Hon. Gérard Pelletier
 Minister of the Environment, Hon. Jack Davis
 Minister of Public Works, Hon. Jean-Eudes Dubé
 Minister of State for Urban Affairs, Hon. Stanley Ronald Basford
 Minister of Regional Economic Expansion, Hon. Donald Campbell Jamieson
 Minister of Manpower and Immigration, Hon. Robert Knight Andras
 Minister of National Defence, Hon. James Armstrong Richardson
 Minister of Justice and Attorney General of Canada, Hon. Otto Emil Lang
 Minister of Consumer and Corporate Affairs, Hon. Herbert Eser Gray
 Minister of National Revenue, Hon. Robert Douglas George Stanbury
 Minister of Supply and Services, Hon. Jean-Pierre Goyer
 Minister of Industry, Trade and Commerce, Hon. Alastair William Gillespie
 Minister of State, Hon. Stanley Haidasz
 Minister of Agriculture, Hon. Eugene Francis Whelan
 Solicitor General of Canada, Hon. Warren Allmand
 Secretary of State of Canada, Hon. James Hugh Faulkner
 Postmaster General, Hon. André Ouellet
 Minister of Veterans Affairs, Hon. Daniel Joseph MacDonald
 Minister of National Health and Welfare, Hon. Marc Lalonde
 Minister of State for Science and Technology, Hon. Jeanne Sauvé.

Each Cabinet Minister usually assumes responsibility for one of the departments of government, although a Minister may hold more than one portfolio at the same time or he may hold one or more portfolios and one or more acting portfolios. A Minister without portfolio may be invited to join the Cabinet because the Prime Minister wishes to have him in the Cabinet without the heavy duties of running a department, or he may be invited to join the Cabinet to provide a suitable balance of regional representation. Because of the cultural and geographical diversity that exists in Canada, it is necessary for the Prime Minister to give more attention to the representational aspect of his Cabinet than, perhaps, his counterparts in many other countries.

With the enactment of the Ministries and Ministers of State Act (Government Organization Act, 1970), four categories of Ministers of the Crown may be identified: departmental Ministers, Ministers without portfolio, and two types of Ministers of state. Ministers of state "for designated purposes" may occupy an office created by proclamation. They are charged with responsibilities for developing new and comprehensive policies in areas where the development of such policies is of particular urgency and importance and have a mandate effectively determined by the Governor in Council which would be of such duration as to enable them to come to grips with the policy problems assigned to them. They may receive powers, duties and functions and exercise supervision and control of relevant elements of the Public Service, and may seek parliamentary appropriations independently of any Minister to cover the cost of their staff and operations. Other Ministers of state may be appointed to assist a departmental Minister in the discharge of his responsibilities. They may receive statutory powers, duties and functions and are limited in number by the appropriations that Parliament is willing to pass. They receive the same salary as a Minister without portfolio, as provided for in the estimates of the Minister with whom they are associated. Ministers in all four categories are appointed on the advice of the Prime Minister by commission under the Great Seal of Canada, to serve at pleasure, and to be accountable to Parliament as members of the government and for any responsibility that might be assigned to them by law or otherwise.

In Canada, almost all executive acts of the government are carried out in the name of the Governor in Council. The Committee of the Privy Council (the Cabinet) makes submissions to the Governor General for his approval, and he is bound by the Constitution in nearly all circumstances to accept them. About 2,900 such Orders in Council were enacted in 1971 and about 3,100 in 1972. Although some were of a fairly routine nature and did not require much discussion in Cabinet of the policy underlying them, others were of major significance and required extensive deliberation, sometimes covering months of meetings of officials and

Cabinet committees, as well as of the full Cabinet. In addition to the determination of the policy underlying the executive acts of the government, there are literally hundreds of other policy issues that must be resolved during the course of a year.

Cabinet must consider and approve the policy underlying each piece of proposed legislation. After it is drafted, proposed legislation must be examined in detail so that each clause and punctuation mark receives Cabinet approval. Recently, between 40 and 60 Bills have been considered by Cabinet during the course of a parliamentary session. Proposals for sweeping reform of large areas of government organization or administration, and policy to be adopted in fundamental constitutional changes or at a major international conference are among the issues which, on occasion, demand this extensive and detailed consideration.

The Cabinet committee system. It is clear that the nature and volume of policy issues to be decided on by Cabinet do not lend themselves to discussion by 25 or 30 Ministers. The first Cabinet committee system was established after the outbreak of World War II but, since that time and more particularly in recent years, growing demands placed on the executive have stimulated the development of new approaches to the delegation of some Cabinet functions to sub-committees.

Cabinet committees tend to have a membership of fewer than ten Ministers and therefore provide a forum capable of ensuring thorough study of policy proposals. The membership of Cabinet committees is confidential and the same rules of secrecy that apply to the deliberations of Cabinet apply to those of Cabinet committees. Otherwise, these committees might develop an importance and authority of their own which would be inconsistent with the principle of the collective responsibility of Ministers. The Prime Minister determines the establishment of Cabinet committees and their composition and terms of reference. Ministers may invite one or two officials to act as advisers during Cabinet committee meetings. The secretariats of the Cabinet committees are provided by the Privy Council Office and the Secretary of a Cabinet committee is usually also an Assistant Secretary to the Cabinet. Treasury Board, which is a Cabinet committee — or more precisely a sub-committee of the Committee of the Privy Council — is the only exception; it has its own secretariat headed by a secretary who has the status of a Deputy Minister.

Under the direction of the Prime Minister, the Secretary to the Cabinet prepares agenda and refers memoranda to Cabinet to the appropriate committee for study and report to the full Cabinet. Except where the Prime Minister instructs otherwise, all memoranda to Cabinet are submitted over the signature of the Minister concerned.

The terms of reference of Cabinet committees cover virtually the total area of government responsibility. All memoranda to Cabinet are first considered by a Cabinet committee, except when they are of exceptional urgency or when the Prime Minister directs otherwise, in which case an item may be considered immediately by the full Cabinet.

On April 30, 1968, the Prime Minister established a new format for Cabinet committees. The trend had been to develop many committees over time to meet situations which eventually disappeared. As a result, there had been a proliferation of committees and the terms of reference of some had become irrelevant. The new system reduced the number of standing committees of Cabinet to eight — four subject-matter committees and four co-ordinating committees. The four subject-matter committees set up were: External Policy and Defence; Economic Policy and Programs; Communications, Works and Urban Affairs; and Social Policy. The four co-ordinating committees were: Priorities and Planning; Legislation and House Planning; Federal-Provincial Relations; and Treasury Board. The accompanying chart indicates the relationship of these committees to the Cabinet process.

The arrangement established in 1968 was further modified in 1969 and 1970. The co-ordinating committees of Cabinet remained but the subject-matter or standing committees were: Economic Policy; External Policy and Defence; Social Policy; Science, Culture and Information; and Government Operations. These committees meet on a regular basis. In addition, there are five special committees of the Cabinet which meet as required: the Special Committee of Council which considers all submissions to the Governor in Council on behalf of the Committee of the Privy Council, and the Cabinet committees on the Public Service, Security and Intelligence, Labour Relations, and Western Grain Problems.

Although the importance of the Cabinet committee system may vary from government to government, evidence of the utility of the system is the growing reliance that has been placed on Cabinet committees since the end of World War II. The following is a brief outline of the

involvement of Cabinet and Cabinet committees in respect of a piece of legislation that the government ultimately introduces in the House of Commons or the Senate.

Either on the initiative of a Minister or his departmental officials, a policy proposal is prepared, the implementation of which will require new legislation or the amendment of existing legislation. The proposal is submitted over the Minister's signature for consideration by the appropriate subject-matter committee. If approval is given, the proposal goes forward to Cabinet for confirmation. If Cabinet confirms the Committee's decision, the Department of Justice is instructed by the Minister who made the proposal to prepare a draft Bill expressing in legal terms the intent of the policy proposal. If the draft Bill meets with the Minister's approval, he submits it to the Cabinet Committee on Legislation and House Planning where it is examined from a legal rather than a policy point of view. If the Committee agrees that the Bill is acceptable in all respects and could be introduced in Parliament, it so reports to Cabinet and Cabinet decides whether to confirm the Committee's decision. If confirmation is given, the Prime Minister initials the Bill and it is then introduced either in the Senate or the House of Commons, depending on constitutional and political considerations.

The order and manner in which a Bill is considered in Parliament is the responsibility of the President of the Privy Council and House Leader who negotiates these matters with his counterparts in the opposition parties. If a Bill is to be introduced in the Senate, the House Leader will discuss questions such as timing and tactics with the Leader of the Government in the Senate, who in turn will negotiate consideration of the Bill with his counterpart in the Senate.

The Privy Council Office is a secretariat providing staff support to the Select Committee of the Privy Council and to the Cabinet. For the purposes of the Financial Administration Act, it is considered a department of government. The Privy Council Office provides secretariats to serve the Cabinet, the Select Committee of the Privy Council and their various sub-committees. Since the Prime Minister is, in effect, chairman of the Cabinet, he is the Minister responsible for the Privy Council Office. The work of the Privy Council Office is directed by a public servant known as the Clerk of the Privy Council and Secretary to the Cabinet. He is the senior member of the Public Service.

Parliamentary secretaries. The Parliamentary Secretaries Act of June 1959 provided for the appointment of 16 parliamentary secretaries from among the members of the House of Commons to assist Ministers in the performance of their duties. That Act was amended by the Government Organization Act, 1970, which allows the number of parliamentary secretaries to equal the number of Ministers who hold offices listed in Section 4 of the Salaries Act (i.e., Ministers with departmental responsibilities, the Prime Minister and the President of the Privy Council). A parliamentary secretary works under the direction of his Minister and has no legal authority in respect of the department with which he is associated, nor is he given acting responsibility or any of the powers, duties and functions of a Minister in the event of his Minister's absence or incapacity. Parliamentary secretaries are appointed by the Prime Minister and hold office for 12 months.

At December 31, 1972, the following parliamentary secretaries, listed with their Ministers, were in office:

Pierre De Bané, Secretary of State for External Affairs
John M. Reid, President of the Privy Council
Joseph-Philippe Guay, Minister of Transport
J.-Roland Comtois, Minister of Finance
Len Marchand, Minister of Indian Affairs and Northern Development
Charles Turner, Minister of Labour
William Rompkey, Minister of the Environment
Ian Watson, Minister of State for Urban Affairs
Marcel Prud'homme, Minister of Regional Economic Expansion
Mark MacGuigan, Minister of Manpower and Immigration
Leonard Hopkins, Minister of National Defence
Raynald Guay, Minister of Justice
Herb Breau, Minister of Industry, Trade and Commerce
Léopold Corriveau, Minister of Agriculture
Gilles Marceau, Secretary of State
Norman A. Cafik, Minister of National Health and Welfare.

The passage of legislation. If a Bill is introduced in the House of Commons and approved there, it is then introduced in the Senate and follows a similar procedure. If a Bill is first introduced in the Senate, the reverse procedure is followed. There are three types of Bills: public Bills introduced by the government; public Bills introduced by private members of Parliament; and private Bills introduced by private members of Parliament. Each type is treated in a slightly different manner, and there are even differences in procedure when the House deals with government Bills introduced pursuant to "supply" and "ways and means" motions on the one hand, and other government Bills on the other. The following outline describes the procedure for a government Bill introduced in the House of Commons.

The sponsoring Minister gives notice that he intends to introduce a Bill on a given subject. Not less than 48 hours later he moves for leave to introduce the Bill and that the Bill be given first reading. This is granted automatically because this first step does not imply approval of any sort and it is only after first reading that the Bill is ordered printed for distribution to the members.

At a later sitting the Minister moves that the Bill be given second reading and that it be referred to an appropriate committee of the House of Commons. A favourable vote on the motion for second reading represents approval of the Bill in principle so there is often an extensive debate, which, according to the Standing Orders of the House of Commons, must be confined to the principle of the Bill. The debate culminates in a vote which, if favourable, results in the Bill being referred to the appropriate committee of the House, where it is given clause-by-clause consideration.

At the committee stage, expert witnesses and interested parties may be invited to give testimony pertaining to the Bill, and the proceedings may cover many weeks.

The House committee then prepares a report which it submits to the House of Commons which must then decide whether to accept the committee's report, including any amendments that the committee has made to the Bill. At the report stage any member may, on giving 24 hours notice, move an amendment to the Bill, and all such amendments are debated and put to a vote. Following that, a motion "that the bill be concurred in" or "that the bill, as amended, be concurred in", is put to the vote.

Following this report stage, the Minister moves that the Bill be given third reading and passage. Debate of this motion is limited to whether the Bill should be given third reading. Amendments are permitted at this stage but they must be of a general nature, similar to those allowed on second reading. If the vote is favourable, the Bill is then introduced in the Senate where it goes through a somewhat similar process. Since each House has its own rules of procedure, the processes in the two may not be identical, and are indeed not identical at this time. At the end of this procedure, the Bill is presented to the Governor General for Royal Assent and for his signature. Depending on the provisions in the Bill itself, it may come into force when it is signed by the Governor General, on an appointed day, or when it is officially proclaimed.

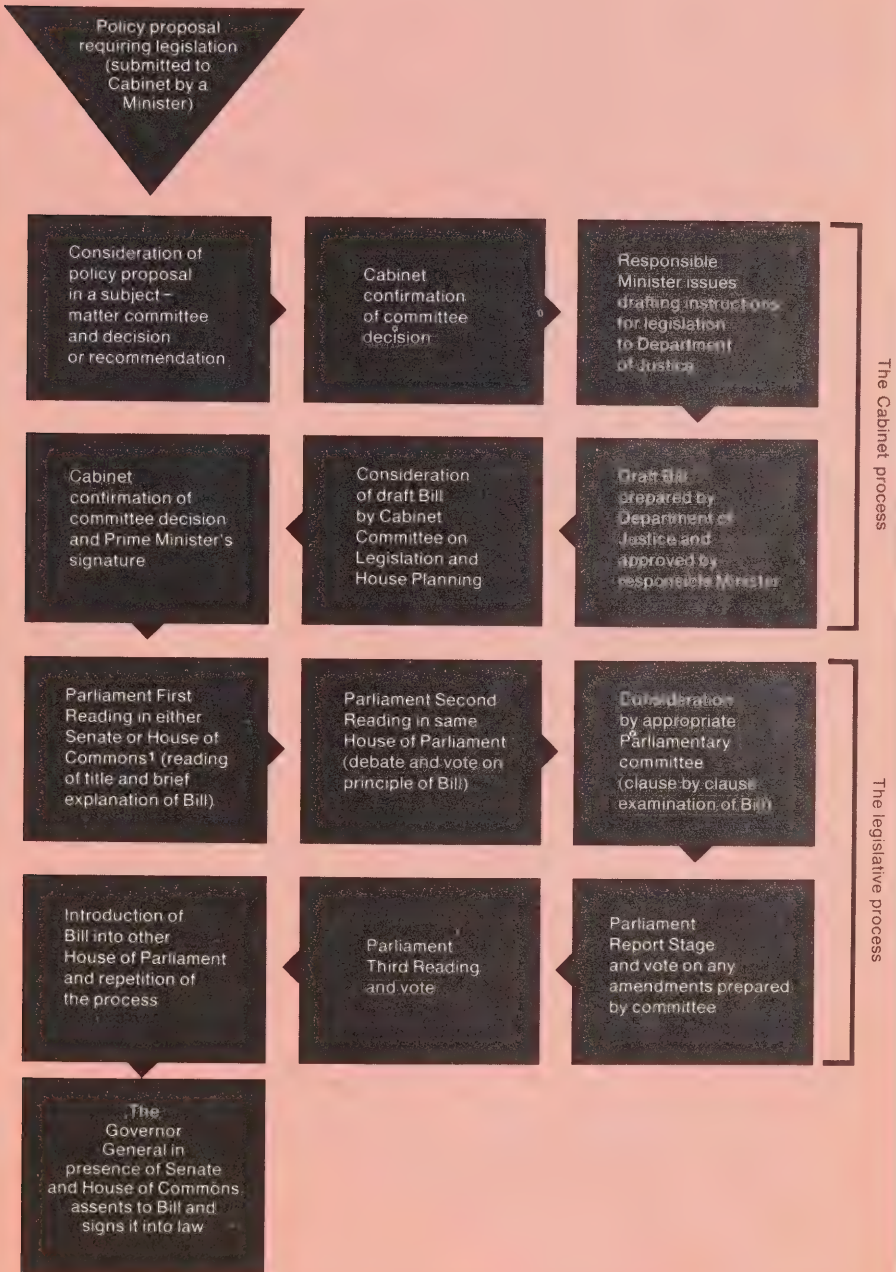

4.1.2 The Legislature

The federal legislative authority is vested in the Parliament of Canada consisting of the Queen, an upper house called the Senate, and the House of Commons. Bills may originate in either the Senate or the House, subject to the provisions of Section 53 of the British North America (BNA) Act, 1867, which provides that Bills for the appropriation of any part of the public revenue or the imposition of any tax or impost shall originate in the House of Commons. Bills must pass both Houses and receive Royal Assent before becoming law. In practice, most public Bills originate in the House of Commons although, at the request of the government, more have recently been introduced in the Senate in order that Bills may be dealt with there while the Commons is engaged in other matters such as the debate on the Speech from the Throne. Private Bills usually originate in the Senate. The Senate may delay, amend or even refuse to pass Bills sent to it from the Commons, but differences are usually settled without serious conflict.

Section 91 of the BNA Acts, 1867 to 1964, assigns to the Parliament of Canada legislative authority in very clearly specified areas. These are discussed in detail in Chapter 3.

Under Section 95, the Parliament of Canada may make laws in relation to agriculture and immigration concurrently with provincial legislatures although federal legislation is paramount in the event of conflict. An amendment to the BNA Act in 1951 (Br. Stat. 1950-51,

Passage of legislation

1. All money Bills must be introduced in the House of Commons.

c.32) authorized the Parliament of Canada to make laws in relation to old age pensions in Canada subject to the proviso that no such law should affect the operation of any provincial laws in relation to old age pensions. By the BNA Act, 1964, this amendment was extended to permit the payment of supplementary benefits, including survivors' and disability benefits irrespective of age, under a contributory pension plan.

Duration and sessions of Parliaments. The length and sessions of the first to the twelfth Parliaments, covering the period from Confederation to 1917, are given in the *1940 Canada Year Book*, p. 46; of the thirteenth to the seventeenth Parliaments in the 1945 edition, p. 53; of the eighteenth and nineteenth Parliaments in the 1957-58 edition, p. 46; of the twentieth to the twenty-third Parliaments in the 1965 edition, p. 65; and of the twenty-fourth to the twenty-eighth Parliaments in this edition, Table 4.1.

The Senate. The Senate has grown from an original membership of 72 at Confederation, through the addition of members to represent new provinces and the general increase in population to a total of 102 members; the latest change in representation was made when Newfoundland entered Confederation in 1949. The growth of representation in the Senate is summarized by province in Table 4.2.

Senators are appointed by the Governor General by instrument under the Great Seal of Canada. By constitutional usage the actual power of nominating senators resides in the Prime Minister whose advice the Governor General accepts in this regard. Until the passage of "An Act to make provision for the retirement of members of the Senate" (SC 1965, c.4), assented to on June 2, 1965, senators were appointed for life; that Act set 75 years as the age at which any person appointed to the Senate after the coming into force of the Bill would cease to hold his place in the Senate.

In each of the four main areas of Canada (Ontario, Quebec, Atlantic Provinces and Western Provinces) except Quebec, senators represent the whole of the province for which they are appointed; in Quebec, one senator is appointed for each of the 24 electoral divisions of what was formerly Lower Canada. The deliberations of the Senate are presided over by a Speaker appointed by the Governor in Council (in effect by the government) and government business in the Senate is sponsored by the Government Leader in the Senate.

The powers of the Senate, in all respects except one, are co-extensive with those of the House of Commons. The one exception is that under the Canadian Constitution all "money Bills", i.e. Bills to impose taxes or appropriate public moneys, must originate in the House of Commons. The concurrence of the Senate is necessary before any piece of legislation, public or private, can become law. Government Bills, other than money Bills, may be introduced in either House. A substantial percentage of these are now introduced in the Senate where they may be freely discussed and amended and the House of Commons thus given the benefit of their prior scrutiny by the Senate.

The Senate also retains its traditional role in respect of legislation originating in the House of Commons, namely, to take a "sober second look" at such legislation and amend it if necessary; such amendments are often concurred in by the House of Commons. If representatives of the two Houses cannot resolve disagreements arising from Senate amendments, the legislation cannot be further considered.

The Senate provides a national forum for the discussion of public issues and the airing of grievances from any part of Canada. Through its own committees and its participation in joint committees of both Houses the Senate is particularly active in making studies in depth on matters of public concern.

As at December 31, 1972 the following were members of the Senate:

Speaker, Hon. Muriel McQueen Fergusson

Leader of the Government, Hon. Paul Martin

Leader of the Opposition, Hon. Jacques Flynn

Clerk of the Senate and Clerk of the Parliaments, Robert Fortier

Newfoundland

Michael G. Basha

Eric Cook

Chesley William Carter

James Duggan

William John Petten

Frederick William Rowe

Prince Edward Island

Florence Elsie Inman

Orville Howard Phillips

The House of Commons. The BNA Act, 1867 provided that Quebec should have a fixed number of 65 members in the House of Commons and that each of the other provinces should be assigned such a number of members as would bear the same proportion to the number of its population as the number 65 bore to the number of the population of Quebec. This Act also provided that on completion of a Census in 1871 and after each subsequent decennial census the representation of the provinces would be readjusted, provided that the proportionate representation of the provinces fixed by the Act remained undisturbed.

In 1946 the House of Commons adopted a resolution stating that the effect of the provisions of the BNA Act relating to representation had not been satisfactory in that proportionate representation of the provinces according to population had not been maintained and that a more equitable apportionment of members to the various provinces

could be effected if readjustments were made on the basis of the population of all the provinces taken as a whole. The Act was amended accordingly in 1946 to provide a new rule to regulate representation in the House of Commons. Generally speaking, representation was fixed as follows:

The membership assigned to each province shall be computed by dividing the total population of the provinces by two hundred and fifty-four and by dividing the population of each province by the quotient so obtained.

This rule, employed in the redistribution of representation made in 1947, was effective in the general election of 1949.

After the completion of the 1951 Census it was apparent that, as a result of a wartime shift of population, a substantial reduction in the representation of Saskatchewan would ensue under the rules then regulating representation. Accordingly, in an effort to eliminate sharp reductions in provincial representation from one census to another, the BNA Act was again amended (RSC 1952, c.304, Sect. 51) to ensure that the representation of any province should not be reduced by more than 15% of the representation to which it was otherwise entitled after the last census, subject however to the qualification that the effect of the rule should not be to make the representation of a province with a smaller population greater than that of a province with a larger population.

In 1952, Parliament enacted legislation (RSC 1952, c.334), effective in the general election of 1953 and in each successive general election down to that of the twenty-seventh Parliament (November 8, 1965), which provided that representation in the House of Commons should be on the following basis:

Sect. 2. — Eighty-five members of the House of Commons shall be elected for the Province of Ontario, seventy-five for the Province of Quebec, twelve for the Province of Nova Scotia, ten for the Province of New Brunswick, fourteen for the Province of Manitoba, twenty-two for the Province of British Columbia, four for the Province of Prince Edward Island, seventeen for the Province of Saskatchewan, seventeen for the Province of Alberta, seven for the Province of Newfoundland, one for the Yukon Territory and one for Mackenzie district of the Northwest Territories, thus making a total of two hundred and sixty-five members.

The Representation Commissioner Act setting up the office and duties of the Representation Commissioner was given Royal Assent on December 21, 1963. The Electoral Boundaries Readjustment Act providing for the establishment of Electoral Boundaries Commissions to report on and to provide for the readjustment of the representation of the provinces in the House of Commons in accordance with the findings of the 1961 Census of Population was given Royal Assent on November 20, 1964.

Pursuant to Section 11 of the Electoral Boundaries Readjustment Act, the Dominion Statistician sent to the Representation Commissioner a certified return showing the population of Canada and of each of the provinces and the population of Canada by electoral districts as ascertained by the 1961 Census. The Representation Commissioner calculated the number of members of the House of Commons to be assigned to each of the provinces subject and according to the provisions of Section 51 of the BNA Act, 1867 as amended, and the rules provided therein. He then caused a statement to be published in the *Canada Gazette* of November 28, 1964, setting forth the following results:

Eighty-eight members of the House of Commons shall be elected for the Province of Ontario, seventy-four for the Province of Quebec, eleven for the Province of Nova Scotia, ten for the Province of New Brunswick, thirteen for the Province of Manitoba, twenty-three for the Province of British Columbia, four for the Province of Prince Edward Island, thirteen for the Province of Saskatchewan, nineteen for the Province of Alberta and seven for the Province of Newfoundland.

By proclamation published in the *Canada Gazette*, the Governor General established an Electoral Boundaries Commission for each province charged with preparing, with all reasonable dispatch, a report setting forth its recommendations concerning the division of its particular province into electoral districts and the recommendations concerning the description of the boundaries of each such district and the representation and name to be given thereto. A copy of the 1961 Census return was sent to the chairman of each Commission immediately after its members were appointed.

As provided for in Section 8 of the Representation Commissioner Act, maps were prepared showing the distribution of population in each province and setting out alternative proposals respecting the boundaries of electoral districts in each province; these maps were then supplied to the respective Commissions. The Commissions completed their reports

within the one-year time limit prescribed by the Electoral Boundaries Act. Two certified copies of each report were received by the Representation Commissioner; as required by Section 19(1) of that Act, one of these copies was sent to the Speaker of the House of Commons, who in turn laid it before the House.

A 30-day period followed in which objections in writing, signed by no fewer than ten members of the House of Commons, could be filed with the Speaker specifying the provisions of the report objected to and the reasons for the objection. A further period of 15 days was set aside in which the House of Commons was to consider the matter of the objections; this period was extended to 45 sitting days by an Act (SC 1966-67, c.2) assented to on February 23, 1966.

Several objections were filed with the Speaker, the motions were taken up and considered and the reports referred to the Representation Commissioner by the Speaker and then to the Commissions. On expiration of a 30-day period, the Commissions returned their reports with or without amendment through the Representation Commissioner to the Speaker. A draft representation order was then prepared by the Representation Commissioner to be transmitted to the Secretary of State. This order specified the number of members of the House of Commons to be elected for each of the provinces as calculated by the Representation Commissioner and, dividing each of the provinces into electoral districts, described the boundaries of each such district and specified the representation and name given thereto, in accordance with the recommendations contained in the reports. The Governor in Council, by proclamation of June 16, 1966, declared the draft representation order to be in force, effective upon the dissolution of the then existing Parliament.

At subsequent elections, according to the representation order set out in the schedule to the proclamation, 88 members of the House of Commons were to be elected for Ontario, 74 for Quebec, 11 for Nova Scotia, ten for New Brunswick, 13 for Manitoba, 23 for British Columbia, four for Prince Edward Island, 13 for Saskatchewan, 19 for Alberta and seven for Newfoundland. In addition, one member each was to be elected for the Yukon Territory and the Northwest Territories, making a total representation of 264 in the House of Commons.

Following the 1971 Census, the Representation Commissioner calculated the number of members of the House of Commons to be assigned to each of the provinces. The results appeared in the *Canada Gazette* of May 13, 1972 as follows:

Ninety-one members of the House of Commons shall be elected for the Province of Ontario, seventy-two for the Province of Quebec, ten for the Province of Nova Scotia, ten for the Province of New Brunswick, twelve for the Province of Manitoba, twenty-six for the Province of British Columbia, four for the Province of Prince Edward Island, twelve for the Province of Saskatchewan, nineteen for the Province of Alberta and six for the Province of Newfoundland.

The Electoral Boundaries Commissions were named in a special edition of the *Canada Gazette* dated June 30, 1972.

At the time of this writing the ten Commissions are preparing the readjustment of federal electoral districts. Each Commission is to complete and forward its report to the Representation Commissioner by July 1, 1973.

The number of representatives of each province elected at each of the 29 general elections since Confederation is given in Table 4.3.

Salaries, allowances and pensions. Members of the Senate and House of Commons receive a sessional allowance at the rate of \$18,000 per annum. In addition, for each session of Parliament, they may be paid such travelling expenses between their place of residence or constituency and Ottawa as may be required for the performance of their duties. Senators receive an annual expense allowance of \$4,000 and members of the House of Commons receive an expense allowance of \$8,000 to \$9,650 dependent upon the electoral district represented; neither is subject to income tax and is payable quarterly. The member of the Senate occupying the recognized position as Leader of the Government in the Senate is paid, in addition to his sessional allowance, an annual allowance of \$10,000 and the member of the Senate occupying the recognized position as Opposition Leader in the Senate is paid, in addition to his sessional allowance, an annual allowance of \$6,000; but if the Leader of the Government is in receipt of a salary under the Salaries Act the annual allowance is not paid. The remuneration of the Prime Minister is \$25,000 a year and of a Cabinet Minister and the Leader of the Opposition in the House of Commons \$15,000 a year in addition to the sessional and expense allowances each receives as a member of Parliament. A Minister without portfolio is paid \$7,500 a year in addition to the sessional and expense allowances; the latter is

not taxable. The Chief Government Whip, the Chief Opposition Whip and each leader of a party having a recognized membership of 12 or more in the House of Commons, other than the Prime Minister and the Leader of the Opposition, receives an annual allowance of \$4,000 in addition to the above-noted sessional allowance. The Speaker of the Senate and the Speaker of the House of Commons each receives, in addition to sessional and expense allowances, a salary of \$9,000 per annum. The Deputy Speaker of the House of Commons receives a salary of \$6,000 per annum. The Speakers of the Senate and of the House of Commons are also entitled to \$3,000 in lieu of residence and the Deputy Speaker of the House of Commons an allowance of \$1,500 in lieu of residence; these allowances are not taxable. The Deputy Chairman of Committees receives an annual allowance of \$4,000. Parliamentary secretaries to Ministers of the Crown receive an annual allowance of \$4,000 a year, in addition to their sessional and expense allowances. A motor vehicle allowance of \$2,000 is paid to each Minister of the Crown and to the recognized Leader of the Opposition in the House of Commons, and a motor vehicle allowance of \$1,000 is paid to the Speakers of the Senate and of the House of Commons; these allowances are not taxable.

A member of Parliament contributes, by reservation, 7.5% of his sessional indemnity toward his retirement allowance, which is based on the average of the sessional indemnity received over the best consecutive six years of his pensionable service accumulated as follows: 3.5% of this six-year average for each of the first ten years of pensionable service; 3% of this average for each of the next ten years; 2% of this average for each of the next five years; and 2% of this average for each of the years of pensionable service earned by his contributions from salary for extra duties performed as a Minister, etc.; subject to an over-all maximum of 75% of that best six-year average. Survivor's benefits are as follows: 60% of the member's pension entitlement to the widow or widower; if there is a surviving parent, 10% of the member's pension entitlement for each child up to three; and if there is no surviving parent, 20% of the member's pension entitlement for each child up to four. A member who was a member on March 31, 1970 had a year in which to elect to come under the plan described here or to remain under a previous plan, described in the *1969 Canada Year Book*, p. 75.

An Act to make provision for the retirement of members of the Senate (SC 1965, c.4) entitles a senator appointed after June 2, 1965 to become a contributor under the provisions of the Members of Parliament Retiring Allowances Act. Senators appointed prior to that date and who have not attained the age of 75 years, who elect under the provisions of this Act, are also entitled to become contributors. Under the provisions of the Retirement Act, as amended, a senator contributes, by reservation, 6% of \$12,000. A senator appointed before June 2, 1965 who (a) within one year of attaining the age of 75 years resigns his place in the Senate, or (b) resigns due to some permanent infirmity disabling him from performing his duties in the Senate, may be granted an annuity equal to \$8,000. The widow of a person granted such an annuity may receive an annuity equal to three fifths of the annuity to the ex-member of the Senate.

Every former Prime Minister who held office for four years will receive from the Consolidated Revenue Fund an allowance of two thirds of the annual salary provided for Prime Ministers under the Salaries Act, the allowance to commence when a Prime Minister ceases to hold that or any other office in Parliament, or attains the age of 70 years, whichever is the later, and to continue during his lifetime. The widow of a Prime Minister will receive an annual payment of one third of the allowance that was being paid or that would have been paid in the event that he died before receiving the allowance, such allowance to commence immediately after the death of her husband and to continue during her natural life or until her remarriage.

None of these allowances is payable while the recipient remains a senator or a member of the House of Commons.

The federal franchise. The present federal franchise laws are contained in the Canada Elections Act (RSC 1970, c.14, 1st Supp.). Generally, the franchise is conferred upon all Canadian citizens who have attained the age of 18 years and are ordinarily resident in the electoral district on the date fixed for the beginning of the enumeration at the election. British subjects, other than Canadian citizens, who were qualified as electors on June 25, 1968 and have not, since that date, ceased to be ordinarily resident in Canada, are also qualified as electors. This privilege granted to a restricted group of British subjects will terminate at

midnight on June 26, 1975. Persons denied the right to vote are: the Chief Electoral Officer and the Assistant Chief Electoral Officer; judges appointed by the Governor in Council; the returning officer for each electoral district; persons undergoing punishment as inmates of any penal institution; persons restrained of their liberty of movement or deprived of the management of their property by reason of mental disease; and persons disqualified under any law relating to the disqualification of electors for corrupt or illegal practices.

Prior to July 1, 1960, the list of persons denied the right to vote included "Indians ordinarily resident on an Indian reserve who were not members of His Majesty's Forces in World Wars I or II or who did not execute a waiver of exemption under the Indian Act from taxation on and in respect of personal property". Legislation proclaimed on that date grants all Indians the same rights with respect to the franchise as those enjoyed by other Canadian citizens, without taking from them any of the rights and privileges to which they are entitled under the Indian Act. Eskimos are qualified as electors for the purpose of federal elections, and that right is being increasingly exercised in the communities of the North as electoral districts are established and polling facilities become available.

The Special Voting Rules set out in Schedule II to the Canada Elections Act prescribe voting procedures for members of the Canadian Forces, for members of the Public Service posted abroad, and also for veterans in receipt of treatment or domiciliary care in certain institutions.

Electoral districts, voters on list, votes polled and names and addresses of members of the House of Commons elected at the twenty-ninth general election, October 30, 1972 are given in Table 4.4. Table 4.5 indicates voters on the lists and votes polled at federal general elections in 1963, 1965, 1968 and 1972.

4.1.3 The Judiciary

The Parliament of Canada is empowered by Section 101 of the British North America Act to provide for the constitution, maintenance and organization of a general Court of Appeal for Canada and for the establishment of any additional courts for the better administration of the laws of Canada. Under this provision Parliament has established the Supreme Court of Canada, the Federal Court of Canada and certain miscellaneous courts. A detailed discussion of the judiciary and legal system of Canada is presented in Chapter 3.

4.2 Federal government administration

4.2.1 Financial administration and control

The financial affairs of the Government of Canada are administered and controlled under the basic principle that no tax shall be imposed and no money spent without the authority of Parliament and that expenditures shall be made only for the purposes authorized by Parliament. The most important constitutional provisions relating to Parliament's control of finances are contained in the British North America (BNA) Act which provides that all federal taxing and appropriating measures must originate in the House of Commons. All requests for grants must come from the Crown through a responsible Minister and the government is solely responsible for such requests. In practice, financial control is exercised through a budgetary system based on the principle that all the financial needs of the government for each fiscal year should be considered at one time so that both the current and prospective conditions of the public treasury may be clearly evident.

Estimates and appropriations. Co-ordination of the estimates process is carried out by Treasury Board. The Secretariat to this Board is a separate department of government, its Minister having the designation of President of the Treasury Board. In addition to the President, the Board consists of the Minister of Finance and four other Privy Councillors. Under the Financial Administration Act, the Board may act for the Privy Council in all matters relating to financial management (including estimates, expenditures, financial commitments, establishments, revenues and accounts), terms and conditions of employment of persons in the Public Service and general administrative policy in the Public Service.

Under present practice departments submit forecasts of their requirements for the next fiscal year many months in advance and in two stages. In the first stage, which starts about 13 months before the beginning of a new fiscal year, departments present forecasts of what they will require in each of the coming three years to maintain the current levels of service in each program. These are termed "A Budgets". At the same time they submit forecasts of

requirements for new activities or expansion in existing activities — “B Budgets”. These proposals are reviewed by Treasury Board in the light of expenditure guidelines approved by the Cabinet which express the government’s current priorities. Treasury Board prepares recommendations for the budgetary and non-budgetary allocations to each program for Cabinet review. In August of the year preceding the fiscal year, departments are advised of the allocations approved by Cabinet. Departments then develop detailed estimates of their resource requirements for the new year against these approved allocations. These estimates are submitted at the end of October. Following review by Treasury Board and approval by Cabinet they are tabled in Parliament in February.

Main estimates and supplementary estimates are referred to committees of the House of Commons. The timing of such referrals, the timing of committee reports and all other matters having to do with the business of supply in the House of Commons are regulated by the Standing Orders of the House (October 1969). The relevant provisions are briefly summarized here. Section 58 of the Standing Orders establishes three supply periods ending, respectively, not later than December 10, March 26 and June 30. The first supplementary estimates for a year are usually dealt with in the December 10 period and the final supplementary estimates in the March 26 period. In addition, interim supply (consisting of 3/12ths for all items in estimates and extra 12ths for some items) is dealt with in the March 26 period. In the June 30 period, the House is asked to provide full supply. The Standing Orders call for the referral of the new year main estimates to standing committees of the House by March 1 of the then expiring fiscal year and they must report back to the House not later than May 31 in the then current fiscal year. Supplementary estimates are referred immediately after they are tabled, usually to the Miscellaneous Estimates Committee of the House, and dates by which reports must be made to the House are stipulated. In each supply period, a number of days are allotted to the business of supply. Opposition motions have precedence over all government supply motions on allotted days and opportunities to put forward motions of non-confidence in the government are provided. On the last allotted day in each period, at 15 minutes before the ordinary time of adjournment the Speaker interrupts the proceedings then in progress and puts every question necessary to dispose of any business relating to supply. No debate takes place after the Speaker has acted in this way and the Appropriation Acts then before the House have to be voted on. These Appropriation Acts authorize payments out of the Consolidated Revenue Fund of the amounts included in the estimates, whether main or supplementary, subject to the conditions stated in them.

In addition to the expenditure items included in the annual Appropriation Acts, there are a number of items, such as interest on the public debt and family allowances, authorized under other statutes. Although it is not necessary for Parliament to approve these items annually, they are included in the main estimates for purposes of information. Statutory provision also exists for the expenditure of public money in emergencies where no parliamentary appropriation is available. Under the Financial Administration Act, the Governor in Council, on the report of the President of the Treasury Board that there is no appropriation for the expenditure and on the report of the appropriate Minister that the expenditure is urgently required, may order a special warrant issued authorizing disbursement of the amount required. Such warrants may be issued only when Parliament is not in session and every warrant must be published in the *Canada Gazette* within 30 days of issue and reported to Parliament within 15 days of assembly. The Fire Losses Replacement Account Act also provides for emergency expenditures for the urgent repair or replacement of property destroyed or damaged by fire, where there is not sufficient money available in the appropriation for the service suffering loss. Such amounts must be charged subsequently to an appropriation or included in the estimates for the department or agency concerned and refunded to the Fire Losses Replacement Account.

In addition, disbursements are made for purposes not reflected in the budgetary accounts but recorded in the government’s statement of assets and liabilities, such as loans to and investments in Crown corporations, loans to international organizations and to national, provincial and municipal governments, and loans to veterans. There are also disbursements in connection with deposit and trust accounts and annuity, insurance and pension accounts which the government holds or administers, including the old age security fund and the Canada Pension Plan fund which are operated as separate entities. These disbursements are excluded from the calculation of the annual budgetary surplus or deficit.

The budget. The Minister of Finance usually presents his annual budget speech in the House of Commons some time after the main estimates have been introduced. Budget papers, tabled for the information of Parliament at least one day prior to the presentation of the budget, include a general review of economic conditions and a preliminary review of the government's accounts for the fiscal year then ending. The budget speech itself reviews the state of the national economy and the financial operations of the government for the previous fiscal year and gives a forecast of the probable financial requirements for the year ahead, taking into account the main estimates and making allowances for supplementary estimates. At the close of his address, the Minister tables the formal resolutions for changes in the existing tax rates and customs tariff which, in accordance with parliamentary procedure, must precede the introduction of any money Bills. These resolutions give notice of the amendments which the government intends to ask Parliament to make in the taxation statutes. However, if a change is proposed in a commodity tax, such as a sales tax or excise duty on a particular item, it is usually made effective immediately; the legislation, when passed, is made retroactive to the date of the speech.

The budget speech is delivered in support of a motion that the House go into committee; debate on this motion may take up six sitting days, but once it is passed the way is clear for consideration of the budget resolutions. When these have been approved by the committee, a report to this effect is made to the House, and the tax Bills are introduced and dealt with in the same manner as all other government financial legislation.

Revenues and expenditures. Administrative procedures governing revenues and expenditures are, for the most part, contained in the Financial Administration Act.

With respect to revenues, the basic requirement is that all public money shall be paid into the Consolidated Revenue Fund, which is defined as the aggregate of all public money on deposit to the credit of the Receiver General. The Minister of Supply and Services is the Receiver General for Canada. Treasury Board has prescribed detailed regulations governing the receipt and deposit of such money. The Bank of Canada and the chartered banks are the custodians of public money. Balances are apportioned among the various chartered banks according to a percentage allocation established by agreement among all the banks and communicated to the Department of Finance by the Canadian Bankers' Association. The daily operating account is maintained with the Bank of Canada and the division of funds between it and the chartered banks takes into account the immediate cash requirements of the government and consideration of monetary policy. The Minister of Finance may purchase and hold securities of, or guaranteed by, Canada and pay for them out of the Consolidated Revenue Fund or may sell such securities and pay the proceeds into the Fund. Thus, if cash balances in the Fund exceed immediate requirements they may be invested in interest-earning assets. In addition, the Minister of Finance has established a purchase fund to assist in the orderly retirement of the public debt.

Treasury Board exercises central control over the budgets of departments and over financial administrative matters generally. Although the most important part of this control function is exercised during the annual consideration of departmental long-range plans and of the estimates, the Board has the right to maintain continuous control over certain types of expenditure to ensure that activities and commitments for the future are held within approved policies, that departments follow uniform, efficient and economical practices, and that the government is informed of and approves any major development of policy or significant transaction that might give rise to public or parliamentary criticism.

To ensure enforcement of the decisions of Parliament, the government and Ministers regarding expenditures, the Financial Administration Act provides that no payment shall be made out of the Consolidated Revenue Fund without the authority of Parliament and no charge shall be made against an appropriation except on the requisition of the appropriate Minister or a person authorized by him in writing. These requisitions, which must meet certain standards prescribed by Treasury Board regulation, are presented to the Receiver General, who makes the payment.

At the beginning of each fiscal year, or whenever Treasury Board may direct, each department, unless otherwise directed by the Board, submits a division into allotments of each vote included in its estimates. Once approved, these allotments cannot be varied or amended without the consent of the Board; expenditures charged to appropriations are limited to such allotments. To avoid over-expenditures within a fiscal year, commitments due to be paid

within the year for which Parliament has provided or has been asked to provide appropriations are recorded and controlled by the departments concerned. Commitments made under contract that will fall due in succeeding years are recorded since the government must be prepared in the future to ask Parliament for appropriations to cover them. Any unexpended amounts in the annual appropriations lapse at the end of the year for which they are granted, but for 30 days subsequent to March 31, payments may be made and charged to the previous year's appropriations for work performed, goods received or services rendered prior to the end of that fiscal year.

Under the Financial Administration Act, every payment against an appropriation is made by the Receiver General by cheque or other instrument. After presentation for payment, the cheques or instruments are cleared daily by the chartered banks through the Bank of Canada to the Cheque Redemption Control Division of the Receiver General; the banks are then reimbursed through a cheque drawn on the Receiver General's account with the Bank of Canada.

Public debt. In addition to collecting and disbursing public money for budgetary and non-budgetary purposes, the government receives and pays out substantial sums in connection with its public debt operations. The Minister of Finance is authorized to borrow money by the issue and sale of securities at whatever rate of interest and under whatever terms and conditions the Governor in Council approves. Although new borrowings require specific authority of Parliament, the Financial Administration Act authorizes the Governor in Council to approve borrowings as required to redeem maturing or called securities. To ensure that the Consolidated Revenue Fund will be sufficient to meet lawfully authorized disbursements, he may also approve the temporary borrowing of such sums as are necessary for periods not exceeding six months. The Bank of Canada acts as the fiscal agent of the government in the management of the public debt.

Accounts and financial statements. Under the Financial Administration Act, Treasury Board may prescribe the manner and form in which the accounts of Canada and the accounts of individual departments shall be kept. Annually, on or before December 31 or, if Parliament is not then sitting, within any of the first 15 days after Parliament resumes, the *Public accounts*, prepared by the Receiver General, is laid before the House of Commons by the Minister of Finance. The *Public accounts* contains a survey of the financial transactions of the fiscal year ended the previous March 31 and statements of revenues and expenditures and of assets and direct and contingent liabilities, together with other accounts and information required to show the financial transactions and financial position of Canada or which are required by law to be reported in the *Public accounts*. The statement of assets and liabilities included in the *Public accounts* is designed to disclose the amount of the net debt, which is determined by offsetting against the gross liabilities only those assets regarded as readily realizable or interest- or revenue-producing. Fixed capital assets, such as government buildings and public works, are charged to budgetary expenditures at the time of acquisition or construction and are shown on the statement of assets and liabilities at a nominal value of \$1. Monthly financial statements are also published in the *Canada Gazette*.

The Auditor General. The government's accounts are subject to an independent examination by the Auditor General who is an officer of Parliament. With respect to expenditures, this examination is a post-audit to report whether the accounts have been properly kept, the money spent for the purposes for which it was appropriated by Parliament and the expenditures made as authorized; any audit before payment is the responsibility of the requisitioning department or agency. With respect to revenues, the Auditor General must ascertain that all public money is fully accounted for and that the rules and procedures applied ensure an effective check on the assessment, collection and proper allocation of the revenue. With respect to public property, he must satisfy himself that essential records are maintained and that the rules and procedures applied are sufficient to safeguard and control it. The Auditor General reports the results of his examination to Parliament, calling attention to any case which he considers should be brought to the notice of the House. He also reports to Ministers, the Treasury Board or the government any matter which in his opinion calls for attention so that remedial action may be taken promptly. It is the usual practice to refer the *Public accounts* and the *Auditor General's report* to the House of Commons Standing Committee on Public Accounts, which may review them and report the findings and recommendations to the House of Commons.

4.2.2 Government employment

Treasury Board (a statutory committee of Cabinet) has over-all responsibility for personnel management in the federal Public Service. In this role it is responsible for development and application of personnel policies, systems and methods to ensure that the human resources needed to carry out programs effectively are obtained at competitive prices and used efficiently with due regard for the individual and collective rights of employees.

The Public Service Commission (an independent agency responsible directly to Parliament) ensures that staffing requirements of departments and agencies are met in accordance with the merit principle, operates staff development and training programs, including language training, and establishes appeal boards as provided for in the Public Service Employment Act.

Treasury Board. Under provisions of the amended Financial Administration Act and the Public Service Staff Relations Act, both proclaimed on March 13, 1967, Treasury Board is responsible for the development of policy guidelines, regulations, standards and programs in the areas of classification and pay, conditions of employment, collective bargaining and staff relations, bilingualism, manpower training, development and utilization, pensions, insurance and other employee benefits.

It is concerned with the development, implementation, maintenance and evaluation of policy guidelines, programs and procedures for the accurate determination, allocation, development and efficient utilization of employees needed in the Public Service to carry out programs effectively. The aim of these measures is to improve the effective use of manpower resources in the Public Service and to this end Treasury Board makes recommendations on organization development, manpower planning, the determination and evaluation of training needs and educational programs, and advises departments and agencies on the design and implementation of systems to improve manpower management.

Treasury Board also develops policy guidelines, programs and regulations on salary administration, benefits and allowances for the Public Service. These functions involve the development and maintenance of classification programs and the associated salary structures. Through delegation, responsibility for classification and the administration of salaries is being transferred progressively to departments, subject to a monitoring process. Benefit programs and allowance policies approved by the Board are designed to give maximum responsibility for administration to departments.

Under the system of collective bargaining established by the Public Service Staff Relations Act, Treasury Board is the employer for all employees in the Public Service, except for certain separate employers such as the National Research Council, the Defence Research Board and the National Film Board. The Board negotiates collective agreements with the unions representing 80 bargaining units and advises departments on their administration. Consultations are held with representatives of bargaining agents, directly or through the National Joint Council, on matters which are not subject to bargaining or which have wide application in the Public Service. The Board determines terms and conditions of employment of employees excluded from collective bargaining, and develops policy guidelines and standards to govern physical working conditions and occupational health and safety. It prepares and presents the employer's position on grievances referred to adjudication, and advises or assists departmental management at preceding stages in the grievance process. The Board presents the position of the employer in applications for certification by employee organizations and in hearings before the Public Service Staff Relations Board on applications for the exclusion of employees from bargaining units.

The Board develops policy guidelines, co-ordinates the administration and recommends periodic revision of pension, insurance, and sick-leave programs for the Public Service, and negotiates reciprocal pension transfer agreements with other public and private employers. It also studies and proposes means of ensuring compatibility between Public Service employee benefits and social security programs such as medicare and the Canada and Quebec Pension Plans.

Treasury Board has the over-all responsibility for developing policy guidelines on the implementation of bilingualism objectives within the Public Service, and for seeing that activities by government departments and agencies in this area are consistent with stated policy. The Board also issues guidelines to departments to help them identify bilingual

positions within their organizations and to prescribe the linguistic requirements of all other positions.

Public Service Commission. The Public Service Employment Act, which became effective on March 13, 1967, continues the status of the Public Service Commission as an independent agency responsible to Parliament. The Commission has the exclusive right and authority to make appointments to and from within the Public Service. The Commission is also empowered to operate staff development and training programs, to assist Deputy Heads in carrying out training and development and in 1972 was charged with investigations into cases of alleged discrimination on grounds of sex, race, national origin, colour or religion in the application and operation of the Public Service Employment Act.

It may establish boards to render decisions on appeals against appointments made from within the Public Service and against release or demotion for incompetence or incapacity, to make recommendations on the revocation of appointments improperly made under delegated authority and to render decisions on allegations of political partisanship.

The Commission grants or withholds approval of applications for leave of absence from public servants who wish to be candidates in federal or provincial elections and conducts investigations into allegations of improper political activities on the part of public servants.

The Act authorizes the Commission to delegate to Deputy Heads any of its powers, except those relating to appeals and inquiries. The Commission has delegated its powers to make appointments in the Operational and Administrative Support Categories; employing departments are required to use the Canada Manpower Centres as their recruitment agency for appointments from outside the Public Service. Delegations of appointing authority in the Administrative and Foreign Service, Technical, and Scientific and Professional categories have been made on a restricted basis. The Commission operates a monitoring program designed to ensure that appointments made under delegated authority comply with the law and with Commission policies.

The Public Service Commission performs its important role as guardian of the merit principle to ensure that high standards of quality are maintained within the Service, consistent with adequate representation of the two official language groups, a bilingual capability to the extent prescribed by the government, equal employment and career development opportunities irrespective of sex, race, national origin, colour or religion, and encouragement of opportunities for disadvantaged people.

Every citizen may apply for positions. Competitive examinations are announced through the news media and posters displayed on public notice boards of major post offices, Canada Manpower Centres, Public Service Commission offices and elsewhere.

The Commission's major task — staffing the Public Service according to merit — is done on an occupational basis. The classification system divides the Service into six broad occupational categories which are further divided into groups of occupationally similar jobs. For each major occupation or group of occupations there is a program of recruitment, selection and placement. Comprehensive manpower planning, developed in co-operation with Treasury Board and employing departments, has been introduced for several occupational groups. Continuous recruitment techniques, utilizing candidate inventories, have been developed and are utilized when appropriate. Appointments are made from within the Service except where the Commission believes it is in the best interests of the Service to do otherwise. Appointments from within the Service are made either through a formal competition or from an employee inventory. "Data Stream", the Commission's computerized manpower inventory, is the primary employee inventory for the Executive, Scientific and Professional, Technical and the Administrative and Foreign Service categories. Under the Public Service Employment Act, public servants who are candidates in a competition open to all or part of the Service may appeal the selections made as a result of the competition to the Public Service Commission.

When a promotion is made without competition, those who would have been eligible to apply if a competition had been held may appeal. Public servants may also appeal the decision of a Deputy Head to recommend release or demotion because of incompetence or incapacity.

Consistent with the growing emphasis on managerial development and continuing education, the Public Service Commission offers interdepartmental courses in government administration, occupational training and management improvement. The Commission acts as the consultant and adviser to Deputy Heads on training matters and the training and

development facilities of the Commission are available to employees to train them for specific occupations or for promotion within the administrative and managerial ranks.

In order that departments may perform their functions effectively and serve the public in accordance with the Official Languages Act, the Commission ensures that employees appointed are qualified in the knowledge and use of English or French or both. The Commission exercises specific responsibilities in the areas of language training, research and the development of selection standards with regard to the linguistic requirements of positions and groups of positions within the federal Public Service. It must establish the method of assessing language knowledge and it must also establish the degree of language knowledge or proficiency possessed by candidates for positions.

The formulation of appropriate selection standards is to be determined in accordance with the decisions of the individual Deputy Heads with respect to the linguistic requirements of positions and groups of positions.

4.2.3 Immigration

The principal objective of Canada's immigration policy is to stimulate growth by admitting immigrants who can contribute to the economic, social and cultural development of this country. At the same time this policy recognizes the right of Canadian residents to facilitate the admission of their relatives and it also provides for participation in programs designed to assist refugees. Canada, as a major immigration country, has been deeply involved in refugee resettlement. More than 300,000 have been admitted since the end of World War II.

The Immigration Regulations introduced in October 1967 provide for admission of immigrants on the basis of either the individual's personal qualifications or his relationship to a Canadian resident, or a combination of both. The selection criteria, applied universally and without reference to the race, colour or geographic origin of applicants, are dictated not only by the attributes generally required for adapting to a new country but by the particular requirements for successful establishment in Canada's technological, industrial and urban society. Hence all applicants seeking to qualify on the basis of their own abilities are assessed on nine relevant factors: age; personal qualities such as motivation and adaptability; education and training; knowledge of English or French; occupational skill; current demand for their occupational skills in Canada; general employment prospects in the area in which they wish to reside; availability of pre-arranged employment; and presence of a relative willing to assist in their establishment.

A major feature of the 1967 Regulations is that they strike a balance between the needs of the Canadian economy and the need to follow a humanitarian policy with regard to the immigrant already in Canada and his family overseas. The Regulations also make a clear distinction between dependent relatives and relatives entering the working force. There are three categories of immigrants: sponsored dependants, nominated relatives (i.e., non-dependent relatives) and independent applicants who are neither sponsored nor nominated but who apply on their own merits. For nominated relatives, the selection criteria are appropriately modified if their successful establishment is reasonably assured by their own qualifications in conjunction with the assistance available from their nominators in Canada. Dependants joining their families in Canada are not subject to the assessment criteria; they are admitted subject only to the requirements that their admission not be to the detriment of public health or order.

The Canada Immigration Division of the Department of Manpower and Immigration administers the Immigration Act and Regulations. The Division has three main branches. The Programs and Procedures Branch is responsible for long- and short-range planning of immigration policies, co-ordination of immigration policies developed internally, functional support in respect of the transportation and initial reception of immigrants in Canada and liaison with transportation companies. The Home Services Branch is responsible for the disposition of difficult individual immigration cases, the provision of procedural guidance to field officers, the formulation of policies and guidelines on the enforcement aspects of immigration operations, and the provision of technical advice on procedures relating to the admission of immigrants and non-immigrants. The Foreign Branch is responsible for the management of the Overseas Service, uniform application of selection standards, promotional activities and implementation of approved programs abroad and the proper counselling and direction of immigrants.

There are 50 Manpower and Immigration offices located outside Canada at: Athens, Atlanta, Beirut, Belfast, Belgrade, Berne, Birmingham, Bordeaux, Boston, Brussels, Budapest, Buenos Aires, Buffalo, Cairo, Cologne, Copenhagen, Chicago, Dallas, Detroit, Dublin, Glasgow, Hamburg, Hong Kong, Islamabad, Kingston, Lisbon, London, Los Angeles, Madrid, Manchester, Manila, Marseille, Milan, Minneapolis, Nairobi, New Delhi, New Orleans, New York, Paris, Port of Spain, Rome, San Francisco, Seattle, Stockholm, Stuttgart, Sydney, Tel Aviv, The Hague, Tokyo and Vienna. Many of these offices have been assigned area responsibilities in countries not serviced by a resident Canadian immigration officer. In order to provide service on a universal basis, visits are made to countries and territories within each designated area as the volume of immigration activity warrants. Because personnel at all posts are kept in touch with economic conditions in Canada, they are able to advise immigrants regarding their prospects of successful establishment in Canada.

Examination of immigrants and visitors is carried out at 547 ports of entry on Canadian coasts, points along the International Boundary and at certain airports and inland offices.

4.2.4 Citizenship

The Canadian Citizenship Act (RSC 1970, c.C-19), which came into force on January 1, 1947 replacing previous Naturalization Acts, created the distinct nationality of a "Canadian citizen" to be recognized throughout the world and it provided a means whereby those non-Canadian British subjects and aliens who were permanently residing in Canada or those who might subsequently immigrate to Canada could apply for Canadian citizenship. The Act also provides for reacquisition of Canadian citizenship by natural-born Canadians. Administration of Canadian citizenship is under the jurisdiction of the Department of the Secretary of State, Citizenship Registration Branch.

Natural-born Canadian citizens. The Act conferred natural-born status on two categories of persons on January 1, 1947: those born in Canada or on a Canadian ship or aircraft and who were not aliens on January 1, 1947; and those born of Canadian fathers outside Canada who were not aliens on January 1, 1947 and were either minors on that date or had already entered Canada for permanent residence.

The Act provides that a person born abroad who was a minor on January 1, 1947 automatically ceased to be a Canadian citizen on his 24th birthday or on January 1, 1954, whichever was later, unless he had his place of domicile in Canada at such date or had, before such date and after reaching the age of 21 years, filed a declaration of retention of Canadian citizenship.

A person born outside Canada after December 31, 1946, whose responsible parent is considered a Canadian citizen under the terms of the Canadian Citizenship Act, is a Canadian if his birth is registered with the Registrar of Canadian Citizenship within two years of its occurrence or within such extended period as the Minister may authorize in special cases.

A person who becomes a natural-born Canadian citizen in this manner will automatically cease to be a Canadian citizen if he fails to file a declaration of retention prior to his 24th birthday or does not have his place of domicile in Canada on that date.

Newfoundland and Canadian citizenship. On April 1, 1949, Newfoundland became the tenth province of Canada and every person born therein or naturalized or every British subject who had domicile in Newfoundland on that date or every woman who married a citizen of Newfoundland and took up residence there before April 1, 1949 became a Canadian citizen. They acquired the right of conferring Canadian citizenship by descent on their children born outside Newfoundland in the same manner as those who had previously become Canadians. Persons born outside Newfoundland to Newfoundland parents are natural-born Canadian citizens provided they were either minors on April 1, 1949 or had before that date been lawfully admitted to Canada or Newfoundland for permanent residence. However, a person who was a minor on April 1, 1949, ceased to be a Canadian on his 24th birthday or on July 1, 1968, whichever was later, unless he had his place of domicile in Canada at that date or had filed a declaration of retention of Canadian citizenship after reaching the age of 21 years. A person born outside Canada to Newfoundland parents after March 31, 1949 is a natural-born Canadian if his birth is registered with the Registrar of Canadian Citizenship within two years of its occurrence or within such extended period as the Minister may authorize in special cases. A person who becomes a natural-born Canadian in this manner will automatically cease to be

a Canadian citizen if he fails to file a declaration of retention prior to his 24th birthday or does not have his place of domicile in Canada on that date.

Canadian citizens other than natural-born. Before the 1953 amendments to the Citizenship Act, the only persons who acquired Canadian citizenship on January 1, 1947 through the transitional clauses of Section 9 were persons naturalized in Canada before that date. British subjects who had Canadian domicile at the commencement of the Act and women lawfully admitted to Canada and married prior to January 1, 1947 whose husbands would have qualified as Canadian citizens if the Act had come into force before the date of marriage. Section 9 was amended on June 1, 1953, so that a British subject domiciled in Canada for at least 20 years immediately before January 1, 1947 need not comply with the requirements of Canadian domicile provided he was not under an order of deportation on January 1, 1947.

Acquisition of Canadian citizenship by aliens or British subjects. An adult non-Canadian British subject or an alien who wishes to become a Canadian must formally file an application for citizenship. The non-Canadian British subject may file an application direct with the Registrar of Canadian Citizenship, whereas an alien must file an application through his local court, or through one of the special citizenship courts now established or, if he lives more than 50 miles from a court, he may mail his application to the Registrar of Canadian Citizenship in Ottawa, who will file it with the appropriate court.

After the application has been posted for three months, he is called to appear before the court for examination. In either case the same requirements apply: (1) He must have resided in Canada for 12 of the 18 months immediately preceding the date of his application. (2) He must have been lawfully admitted to Canada for permanent residence and either have acquired Canadian domicile before July 7, 1967, or have resided in Canada for five of the eight years immediately preceding the filing of his application. (Persons living in Canada before obtaining landed-immigrant status may count half of each full year before landing toward the residence qualification. The wife of a Canadian needs only to be admitted for permanent residence and reside in Canada for one year.) (3) He must be of good character and not under an order of deportation. (4) He must have an adequate knowledge of either English or French or, alternatively, be the spouse, widow or widower of a Canadian or, either be 40 or more years of age at the time of lawful admission and have resided in Canada for more than ten years or be less than 40 at the time of admission and have resided continuously in Canada for more than 20 years. (5) He must have an adequate knowledge of the responsibilities and privileges of citizenship. (6) He must intend to comply with the Oath of Allegiance and to have his place of domicile permanently in Canada.

At the conclusion of the hearing, the decision of the court is forwarded to the Minister responsible for administering the Canadian Citizenship Act. If favourable, a certificate of Canadian Citizenship granted by the Minister is forwarded to the clerk of the court who notifies the applicant when to appear before the court to take the Oath of Allegiance, renounce his previous nationality and receive his certificate. Where a court finds that an applicant does not possess the required qualifications, the Minister will advise the applicant and give him notice that he may appeal the decision within 30 days to the Citizenship Appeal Court which is the Trial Division of the Federal Court of Canada. If a court rejects an application and this decision is upheld by the Citizenship Appeal Court or if an application is refused by the Minister, the applicant has the right to file a new application two years after the date of rejection.

Status of married women. The Canadian Citizenship Act places no disabilities on the married woman. She neither acquires nor does she lose Canadian citizenship by marriage. In order to acquire Canadian citizenship she must apply in exactly the same manner as does a man. The Canadian Citizenship Act enables a woman married to an alien whose nationality she acquired on marriage to divest herself of Canadian citizenship by the filing of a declaration of renunciation; it also provides for her to reacquire her Canadian citizenship on application. Finally, it provides a means whereby a woman, who had become an alien through marriage prior to January 1, 1947, may acquire the Canadian status she would otherwise have assumed on that date.

Status of minor children. Alien and British subject minor children do not automatically become Canadians with their parents. After one parent has become a Canadian, the

responsible parent of that child — his mother if she has de facto custody of the child or maintains him — the tutor or the legal guardian of the child may apply for citizenship on the child's behalf. Application is made to the Registrar of Canadian Citizenship, Ottawa. Provision is also made in the Citizenship Act to grant a certificate of citizenship to a minor child in special circumstances.

Loss of Canadian citizenship. Certain circumstances result in loss of citizenship. A Canadian loses his citizenship if when outside Canada and not under disability he acquires by a voluntary and formal act other than marriage the nationality or citizenship of a country other than Canada. This does not apply if the country is at war with Canada at the time of acquisition but in such a case the Minister may order that he cease to be a Canadian citizen. The purpose of this is to hold the person, if deemed necessary, to his obligations as a Canadian. A natural-born Canadian citizen who is a dual national by birth or through naturalization, and any Canadian citizen on marriage, may after attaining the age of 21 cease to be a Canadian citizen by making a declaration of renunciation thereof. A Canadian citizen who under the law of another country is a national or citizen of such country and who serves in the armed forces of such country when it is at war with Canada loses his Canadian citizenship. This does not apply if the Canadian citizen became a national or citizen of such country when it was at war with Canada.

Prior to the 1967 amendments of the Citizenship Act, a person, other than a natural-born Canadian, who since becoming a Canadian had resided outside Canada for ten consecutive years automatically ceased to be a Canadian; this provision for automatic loss has been removed from the Citizenship Act. In addition, before the 1967 amendments, loss of Canadian citizenship by revocation was limited under certain provisions of the Act only to non-natural-born Canadians. This discriminatory distinction between non-natural-born and natural-born Canadians has been removed from the Citizenship Act and the following substituted: Canadian citizenship may be revoked by the Governor in Council if, on a report from the Minister, he is satisfied that any Canadian citizen has, when not under a disability, acquired voluntarily, when in Canada, the citizenship of a foreign country (other than by marriage); taken or made an oath, affirmation or other declaration of allegiance to a foreign country; made a declaration renouncing his Canadian citizenship; or obtained Canadian citizenship by false representation or fraud or by concealment of material circumstances. Where in the opinion of the Minister a doubt exists as to whether a person has ceased to be a Canadian citizen, the Minister may refer the question to the commission referred to in the Citizenship Act for a ruling and the decision of the commission or the court, as the case may be, shall be final.

Citizenship statistics. Citizenship certificates are "issued" for various reasons to persons who are already Canadian citizens; certificates are "granted" to those who become Canadian citizens by the grant of such certificates. In 1971, 99,188 certificates were issued and 63,668 were granted. Of the latter, 21,038 went to British subjects and 42,630 to aliens.

The decennial census of Canada requires that each person state the country to which he owed allegiance and had citizenship rights as of June 1 of the census year. According to the 1971 Census, only 6% of the Canadian population on June 1, 1971 reported a country of citizenship other than Canada.

4.2.5 Native peoples

4.2.5.1 Indians

The federal Department of Indian Affairs and Northern Development is responsible for the 257,619 Indians registered with the Department under the Indian Act. The role of the federal government in administering Indian affairs is changing as the native people become involved in managing their own affairs, as Indian representatives and government confer before major policy decisions are taken, and as band councils plan activities and distribute funds available under the Indian Affairs program.

Community development. The Department's Community Affairs Branch assists with the physical development of Indian communities, which involves planning, housing, water, sanitation, electrification and construction and maintenance of roads on reserves. Indian participation in these activities as well as in services such as school maintenance, fire and police protection and local government is increasing as the concept of band management is extended.

Under agreements with the federal government, Indian associations receive the funds appropriated for local administration and operate needed community services themselves. Since the first such agreement was concluded with the Manitoba Indian Brotherhood in 1969, others have been entered into with Indian associations in Saskatchewan, Nova Scotia, New Brunswick, British Columbia and the Yukon Territory. In 1971-72, 437 bands handled more than \$32 million in program funds.

The federal government administers three housing programs on reserves: subsidy housing, a program of direct subsidy; band-administered housing, a scheme in which band councils are authorized to administer federal appropriations either as the sole source of financing or in conjunction with band funds and Central Mortgage and Housing Corporation (CMHC) loans; and Indian on-reserve housing, a system of CMHC loans to individuals, guaranteed by the Minister and often applied in conjunction with band funds or federal subsidies. Indians employed away from the reserve, wishing to live in non-Indian communities, are eligible for loans from CMHC or approved lenders in conjunction with a program of forgivable mortgage loans from the federal government.

Economic development. The Department, through its Indian-Eskimo Economic Development Branch, works to raise the economic status and increase the independence of individuals and bands by assisting in creation of business and employment opportunities in service and secondary industries and in areas of resource utilization and land development, including the development of mineral resources on Indian reserves. Many of these programs are conducted in co-operation with other federal government departments, provincial governments and private organizations. Assistance is in the form of loans, grants, loan guarantees, technical and management advice, and specialized training. The loans, grants and guarantees are provided from the Indian Economic Development Fund, capitalized at \$27.1 million for the year ended March 31, 1973. In addition, the Branch has 1972-73 appropriations totalling \$15.8 million to be used for the encouragement of economic activity through the provision of basic infrastructure and professional and technical services. The Branch also administers the Indian reserves and surrendered lands as well as certain categories of Indian estates.

Social services. Indians are eligible for benefits from a number of welfare programs which are administered by different levels of government, Indian bands and private agencies. Like other Canadians, not all Indians have the same programs available to them, as some programs vary not only between but also within provinces and on and off reserves.

Some Indian bands administer social assistance and child care for persons living on the reserve of the band. The criteria of eligibility and rates of payment for social assistance are based on those of the province in which the band is located. Family allowances, youth allowances, old age security and the guaranteed income supplement are paid to Indians by the Department of National Health and Welfare on the same basis as they are paid to other Canadians.

Indians are eligible for benefits from some, but not all, provincial welfare programs except in the Northwest Territories, where they are eligible for benefits from all territorial welfare programs. Generally speaking, Indians are eligible for benefits under provincial programs for specific categories of persons, such as the blind. Benefits from less specific programs, such as social assistance, are not generally available to Indians living on reserves, although they are in some parts of some provinces.

The federal Department of Indian Affairs and Northern Development provides social assistance, care for children and care for physically handicapped adults for Indians when these are not available from other sources. The criteria of eligibility and the rates used in calculating the amount to which an applicant for social assistance is entitled are based on those of the province in which the person applies for assistance.

Indian consultation and negotiation. In recent years the Department of Indian Affairs and Northern Development has provided consultation funds to finance meetings between departmental officials and Indian associations representing bands, as well as all-chiefs conferences. An increasing number of bands have indicated that they wish to carry out consultations on their own to resolve matters of immediate concern. At the Regional Directors Conference in February 1972 it was agreed that more emphasis should be placed on meetings between regional staff and bands, and less on conferences with associations and between associations and bands.

Financing from the Department of the Secretary of State provides for administrative and functional operations of Indian associations and supports at least one all-chiefs meeting per province each year.

Research and liaison. A Policy Planning and Research Branch of the Department was set up late in 1972 to develop stronger liaison with Indian bands and associations, to carry out research activities for the Indian-Eskimo program and to collect and analyze data on program activities. The Indians have expressed a desire to administer many activities at the band level and still others at the association level. Responsibilities for local administration and for economic and community development are being progressively transferred to the Indians themselves but the transfer presents difficulties that will not be easily or inexpensively overcome. Transfer techniques, financial arrangements, agreements and training programs are being developed and implemented in preparation for a phase-out of federal staff when the Indians are adequately trained. Meanwhile, the Branch must maintain and improve the reasonably effective dialogue that has now been developed with most of the Indian associations.

4.2.5.2 Eskimos

At present the federal Department of Indian Affairs and Northern Development is responsible, either directly or indirectly through the Northwest Territories government, for the 17,000 Eskimo people, or Inuit as they prefer to be called, in the Northwest Territories, Arctic Quebec, Labrador and Manitoba.

In the Northwest Territories, education, welfare, municipal services and most provincial-type functions are administered by the territorial government with federal financial support. In other parts of Canada the Department administers these services. The Northwest Territories Council enacts health ordinances but the federal Department of National Health and Welfare provides all health care services to northern residents. The territorial government operates a health insurance plan and coverage was made available to all residents on April 1, 1971. Most settlements of more than 250 have nursing stations; complicated medical or surgical cases are flown to larger centres.

The federal Northern Housing Program has resulted in the construction of 2,200 modern housing units most often rented fully serviced to the Inuit, but there is a provision for ownership with part of the rent applied to the purchase price. Because the Eskimo tenant associations manage these rental projects, the program is contributing to community development and independence.

Co-operatives, run by the Eskimos themselves with technical assistance from the Department of Indian Affairs and Northern Development, represent a further step toward financial and administrative autonomy. Co-operatives in 27 Eskimo settlements have contributed more than \$5 million to the local economy in wages and salaries, through the marketing of such products as handicrafts, sculpture and Arctic gourmet foods.

4.2.6 Departments, boards, commissions and corporations

In Canada the work of government is conducted by federal departments, special boards, commissions and Crown corporations. During the past quarter-century this last type of organization, the Crown corporation, has been used frequently for administering and managing many public services in which business enterprise and public accountability must be combined. The historical evolution of Crown corporations is described in the *1972 Canada Year Book*, p. 153. Part VIII of the Financial Administration Act (RSC 1970, c.F-10) provides a uniform system of financial and budgetary control and of accounting, auditing and reporting for Crown corporations. In addition, that legislation defines a Crown corporation as a corporation that is ultimately accountable, through a Minister, to Parliament for the conduct of its affairs and establishes three classes of corporation — departmental, agency and proprietary.

Departmental corporations. A departmental corporation is defined as a Crown corporation that is a servant or agent of Her Majesty in right of Canada and is responsible for administrative, supervisory or regulatory services of a governmental nature. The following corporations are classified as departmental corporations in Schedule B to the Financial Administration Act:

Agricultural Stabilization Board

Atomic Energy Control Board
Director of Soldier Settlement
The Director, The Veterans' Land Act
Economic Council of Canada
Fisheries Prices Support Board
Medical Research Council
Municipal Development and Loan Board
National Museums of Canada
National Research Council
Science Council of Canada
Unemployment Insurance Commission.

Agency corporations. An agency corporation is defined as a Crown corporation that is an agent of Her Majesty in right of Canada and is responsible for the management of trading or service operations on a quasi-commercial basis or for the management of procurement, construction or disposal activities on behalf of Her Majesty in right of Canada. The following corporations are classified as agency corporations in Schedule C to the Financial Administration Act:

Atomic Energy of Canada Limited
Canadian Arsenals Limited
Canadian Commercial Corporation
Canadian Dairy Commission
Canadian Film Development Corporation
Canadian Livestock Feed Board
Canadian National (West Indies) Steamships Limited
Canadian Patents and Development Limited
Canadian Saltfish Corporation
Company of Young Canadians
Crown Assets Disposal Corporation
Defence Construction (1951) Limited
National Battlefields Commission
National Capital Commission
National Harbours Board
Northern Canada Power Commission
Royal Canadian Mint
Uranium Canada Limited.

Proprietary corporations. A proprietary corporation is defined as a Crown corporation that is responsible for the management of lending or financial operations, or for the management of commercial or industrial operations involving the production of or dealing in goods and the supplying of services to the public, and is ordinarily required to conduct its operations without parliamentary appropriations. The following corporations are classified as proprietary corporations in Schedule D to the Act:

Air Canada
Canada Deposit Insurance Corporation
Canadian Broadcasting Corporation
Canadian Overseas Telecommunication Corporation
Cape Breton Development Corporation
Central Mortgage and Housing Corporation
Eldorado Aviation Limited
Eldorado Nuclear Limited
Export Development Corporation
Farm Credit Corporation
Freshwater Fish Marketing Corporation
National Railways, as defined in the Canadian National - Canadian Pacific Act (RSC 1952, c.39)
Northern Transportation Company Limited
Pilotage Authorities:
 Atlantic Pilotage Authority
 Laurentian Pilotage Authority
 Great Lakes Pilotage Authority
 Pacific Pilotage Authority
St. Lawrence Seaway Authority
Seaway International Bridge Corporation Limited (formerly Cornwall International Bridge Company Limited).

Departmental corporations are governed by the provisions of the Financial Administration Act that are applicable to departments generally. Agency and proprietary corporations, however, are subject to the provisions of the Crown corporations Part of the Act, although, if there is any inconsistency between its provisions and those of any other Act applicable to a corporation, the Act provides that the latter prevail. The same Part provides for control and regulation of corporation budgets and bank accounts, turning over surplus money to the Receiver General, loans for limited working-capital purposes, awarding of contracts and establishment of reserves, keeping and auditing of accounts, and the preparation of financial statements and reports and their submission to Parliament through the appropriate Minister.

A further form of control is exercised by Parliament through the power to vote financial assistance to a corporation, which may secure financing through parliamentary grants, loans or advances, by the issue of capital stock to the government, or by the sale of bonds to either the government or the public. Several corporations finance all or a portion of their requirements from their own resources or earnings.

Before 1952 Crown corporations did not pay corporate income taxes. However, the Income Tax Act was amended, effective January 1, 1952, to require proprietary Crown corporations to pay taxes on income earned in the same manner as any privately owned corporation. As a result of this amendment it is now possible to make a more realistic comparison of the financial statements of these Crown companies with those of private industry, and thus assess the relative efficiency of their operations. Crown corporations also pay provincial retail sales taxes, gasoline or motor vehicle fuel taxes and motor vehicle fees subject to the terms of the Crown Corporations (Provincial Taxes and Fees) Act of 1964.

Unclassified corporations. The following Crown corporations, because of the special nature of their operations, are not classified in the Financial Administration Act but are governed by their own Acts of incorporation: the Bank of Canada; the Canada Council; the Canadian National Railways Securities Trust; the Canadian Wheat Board; the Industrial Development Bank; and the National Arts Centre Corporation. The only provision of the Financial Administration Act to which they are subject is that governing the appointment of auditors. The Eastern Rockies Forest Conservation Board (a joint federal-provincial corporation) is also governed by its own Act of incorporation.

Other corporations. Some corporations established by the government are not agencies of the Crown. These independent entities are not subject to the provisions of the Financial Administration Act and do not report to Parliament. The Canada Development Corporation, Telesat Canada and Panarctic Oils Ltd. are corporations of this type.

An alphabetical list of federal Ministers and the departments and other agencies for which they report to Parliament follows. Brief descriptions of the functions of these government organizations and related agencies will be found in Appendix 1. The accompanying organization chart illustrates the federal structure to the departmental level. A more detailed chart is available from Information Canada.

Minister of Agriculture

Department of Agriculture
Agricultural Products Board
Agricultural Stabilization Board
Canadian Dairy Commission
Canadian Grain Commission
Canadian Livestock Feed Board
Farm Credit Corporation
National Farm Products Marketing Council

Minister of Communications

Department of Communications
Canadian Overseas Telecommunication Corporation
Canadian Radio-Television Commission

Minister of Consumer and Corporate Affairs

Department of Consumer and Corporate Affairs
Canadian Consumer Council
Copyright Appeal Board
Restrictive Trade Practices Commission

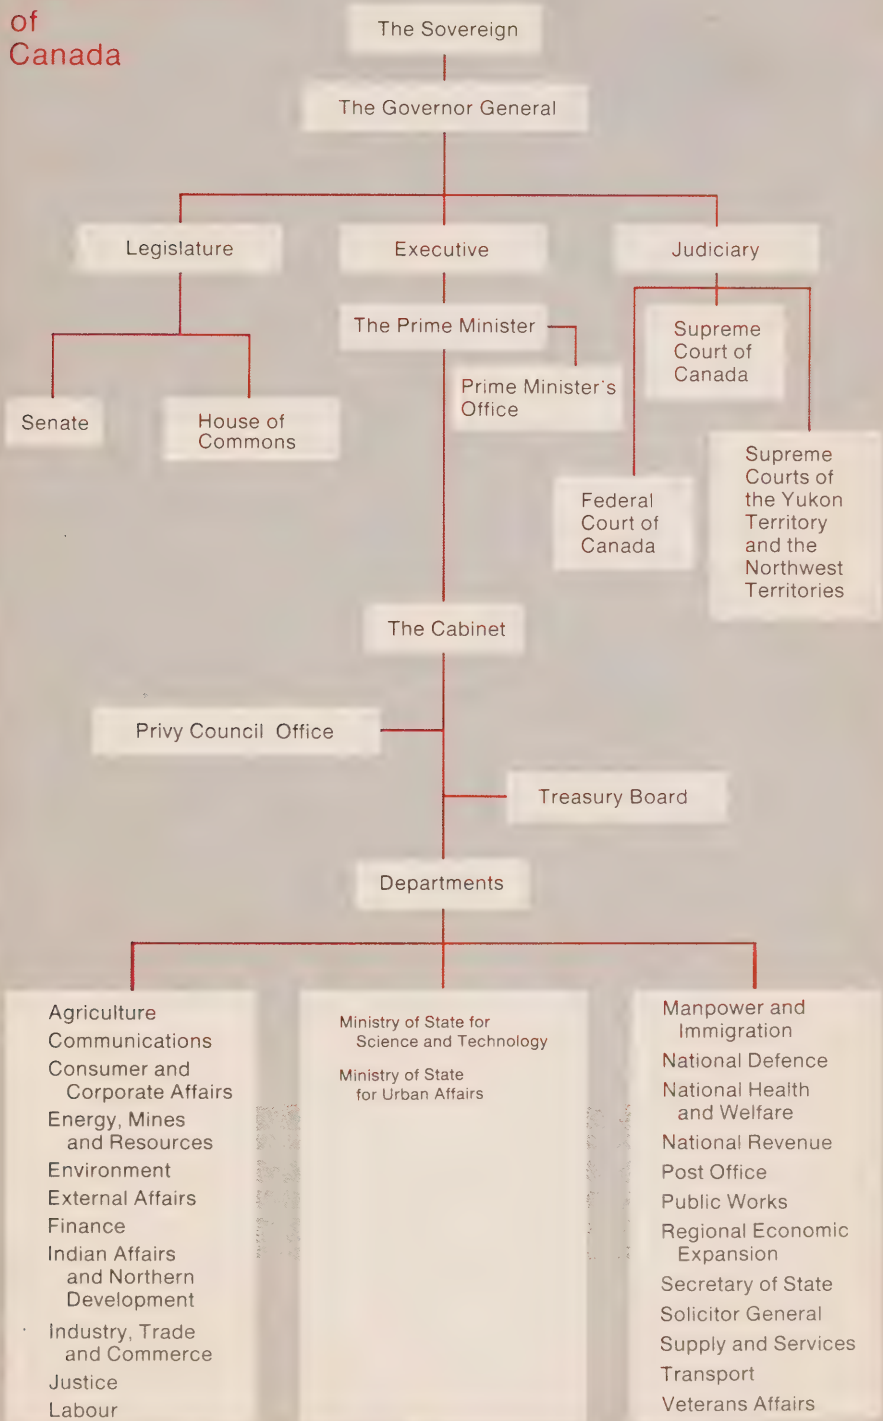

Minister of Energy, Mines and Resources

Department of Energy, Mines and Resources
Atomic Energy of Canada Limited
Atomic Energy Control Board
Board of Examiners for Dominion Land Surveyors
Canadian Permanent Committee on Geographical Names
Columbia River Treaty Permanent Engineering Board
Eldorado Aviation Limited
Eldorado Nuclear Limited
Interprovincial Boundary Commission
National Energy Board
Uranium Canada Limited

Minister of the Environment

Department of the Environment
Canadian Saltfish Corporation
Eastern Rockies Forest Conservation Board
Fisheries Prices Support Board

The Government of Canada

Minister of the Environment (concluded)

Fisheries Research Board of Canada
 Freshwater Fish Marketing Board
 International Fisheries Commission

Secretary of State for External Affairs

Department of External Affairs
 Canadian International Development Agency
 Canadian International Development Board
 Foreign Claims Commission
 International Boundary Commission
 International Development Research Centre
 International Joint Commission
 Roosevelt Campobello International Park
 Commission

Minister of Finance

Department of Finance
 Anti-dumping Tribunal
 Bank of Canada
 Canada Deposit Insurance Corporation
 Department of Insurance
 Halifax Relief Commission
 Industrial Development Bank
 Inspector General of Banks
 Inter-American Development Bank (Canadian
 section)
 Municipal Development and Loan Board
 Tariff Board

Minister of Indian Affairs and Northern Development

Department of Indian Affairs and Northern
 Development
 Commissioner of the Northwest Territories
 Commissioner of the Yukon Territory
 Heritage Canada
 Historic Sites and Monuments Board of Canada
 Indian Claims Commission
 National Battlefields Commission

4.3 Provincial and territorial governments**4.3.1 Provincial governments**

In each of the provinces, the Queen is represented by a Lieutenant-Governor appointed by the Governor General in Council. The Lieutenant-Governor acts on the advice and with the assistance of his Ministry or Executive Council which is responsible to the legislature and resigns office under circumstances similar to those described concerning the federal government.

The legislature of each province is unicameral, consisting of the Lieutenant-Governor and a Legislative Assembly. The Legislative Assembly is elected by the people for a statutory term of five years but may be dissolved within that period by the Lieutenant-Governor on the advice of the Premier of the province.

Sections 92, 93 and 95 of the British North America Act, 1867 (Br. Stat. 1867, c.3 and amendments) assign legislative authority in certain areas to the provincial governments (see Chapter 3).

Details regarding qualifications and disqualifications of the franchise are contained in the Elections Act of each province. In general, every person at a specified age (18 to 21 years) who is a Canadian citizen or (in certain provinces) other British subject, who complies with certain residence requirements in the province and the electoral district of polling and who falls under no statutory disqualifications, is entitled to vote. Voting privileges are given to persons in Prince Edward Island, New Brunswick, Quebec, Ontario, Manitoba, Saskatchewan and Alberta at the age of 18 and in Newfoundland, Nova Scotia and British Columbia at 19 years.

4.3.1.1 Newfoundland

The government of Newfoundland has a Lieutenant-Governor, an Executive Council and a House of Assembly, made up of 42 members elected for a term not to exceed five years. Since April 2, 1969 the Lieutenant-Governor has been the Honourable E. John A. Harnum. The Legislature elected March 24, 1972 is the thirty-sixth in the history of Newfoundland and the eighth since Confederation. After a by-election in August 1972, 33 Progressive Conservatives, eight Liberals and one member of the New Labrador party held seats in the House.

The Premier receives a salary of \$22,000 and Cabinet Ministers \$21,000 per annum, plus a sessional indemnity of \$6,666.67 and a travelling and expense allowance of \$3,333.33. Each member of the House of Assembly receives a sessional indemnity of \$6,666.67 plus a travelling and expense allowance of \$3,333.33. The Leader of the Opposition receives an additional allowance of \$11,000.

The second Ministry of Newfoundland as at December 31, 1972

Premier, Hon. F.D. Moores

Minister of Justice and President of the Council.

Hon. Alex T. Hickman

Minister of Finance and President of the Treasury Board, Hon. J.C. Crosbie

Minister of Education, Hon. G. Ottenheimer

Minister of Industrial Development, Hon. C.W.
Doody
Minister of Municipal Affairs and Housing, Hon.
H. Collins
Minister of Provincial Affairs and Environment,
Hon. T. Hickey
Minister of Manpower and Industrial Relations,
Hon. G. Dawe

Minister of Agriculture and Forests, Hon. E.
Maynard
Minister of Fisheries, Hon. Roy Cheeseman
Minister of Public Works and Services, Hon. V.
Earle
Minister of Tourism, Hon. T. Doyle
Minister of Rehabilitation and Recreation, Hon. J.
Rousseau
Minister of Mines and Energy, Hon. L. Barry
Minister of Rural Development, Hon. J. Reid
Minister without portfolio, Hon. William Marshall.

4.3.1.2 Prince Edward Island

The government of Prince Edward Island consists of a Lieutenant-Governor, an Executive Council and a Legislative Assembly. The present Lieutenant-Governor is the Honourable J. George MacKay, appointed effective October 6, 1969. The Legislative Assembly has 32 members from 16 electoral districts who may serve for a statutory term not exceeding five years. Each district elects two representatives to the Legislature. The fifty-second Assembly elected May 11, 1970 consisted of 27 Liberals and five Progressive Conservatives; as at December 31, 1972 party standings had changed to 25 Liberals and seven Progressive Conservatives.

A member of the Assembly receives \$4,000 for each regular session attended by him and an additional \$2,000 tax-free, for travelling and other expenses incurred with session attendance and representing his district. In addition, the Premier receives a salary of \$10,000, a Cabinet Minister \$6,000 and a Minister without portfolio \$3,600. The Speaker of the Assembly is paid an additional indemnity of \$1,000 and his tax-free allowance is increased by \$500 for each session; higher sessional indemnities and allowances are also available to the Deputy Speaker in the amounts of \$600 and \$300, respectively, and to the Leader of the Opposition in the amounts of \$2,000 and \$1,000. All indemnities and allowances accrue from the date of election to the legislature and are paid monthly. No sessional indemnity or expenses are paid for any special session of the Legislature.

The twenty-seventh Ministry of Prince Edward Island as at December 31, 1972

Premier and Minister of Agriculture and Forestry,
Hon. Alexander B. Campbell
President of the Executive Council, Minister of
Justice, Attorney and Advocate General
and Provincial Secretary, Hon. Gordon L.
Bennett
Minister of Public Works and Highways, Hon.
George J. Ferguson
Minister of Finance, Hon. T. Earle Hickey
Minister of Industry and Commerce and Minister
of Development, Hon. John H. Maloney
Minister of Health, Minister of Social Services and
Minister of Labour, Hon. Bruce L. Stewart
Minister of the Environment and Tourism, Minister
of Community Services, and Chairman of the
PEI Centennial (1973) Commission, Hon.
Robert Schurman
Minister of Fisheries, Hon. Robert E. Campbell
Minister of Education, Hon. Bennett Campbell
Minister without portfolio and Minister responsible
for the PEI Housing Authority, Hon. Jean
Canfield.

4.3.1.3 Nova Scotia

The government of Nova Scotia consists of a Lieutenant-Governor, an Executive Council and a House of Assembly. Since July 22, 1968 the Honourable Victor deB. Oland has been Lieutenant-Governor. The Legislature has 46 members elected for a maximum term of five years. On October 13, 1970, 23 Liberals, 21 Progressive Conservatives and two New Democrats were elected to the province's fiftieth Legislature and twenty-seventh since Confederation.

The Premier of the province receives a salary of \$18,500 per annum and each Cabinet Minister a salary of \$16,500 per annum. Each member of the House of Assembly is paid a sessional indemnity of \$5,000 and an allowance of \$2,500 for expenses incidental to the discharge of his duties. The Leader of the Opposition receives an allowance of \$16,500 in addition to his sessional indemnity.

The eighteenth Ministry of Nova Scotia as at December 31, 1972

Premier and Chairman, Nova Scotia Power
Commission, Hon. Gerald A. Regan
Minister of Finance and Minister in charge of the
administration of the Emergency Measures
Organization (NS) Act and Regulations, Hon.
Peter M. Nicholson

Provincial Secretary (with special responsibilities for Youth and Recreation), Hon. A. Garnet Brown
 Attorney General and Minister of Highways, Hon. Leonard L. Pace
 Minister of Fisheries and Minister of Public Works, Hon. Benoit Comeau
 Minister of Public Welfare and Minister in charge of the administration of the Human Rights Act, Hon. J. William Gillis
 Minister of Education and Minister in charge of the administration of the Civil Service Act and the Civil Service Joint Council Act, Hon. Allan E. Sullivan
 Minister of Development, Hon. Ralph F. Fiske

Minister of Public Health, Minister of Labour and Minister in charge of the Administration of the Housing Development Act, Hon. D. Scott MacNutt
 Minister of Municipal Affairs, Minister of Tourism and Minister in charge of the administration of the Liquor Control Act, Hon. J. Fraser Mooney
 Minister of Mines and Minister in charge of the administration of the Water Act, Hon. Glen M. Bagnell
 Minister of Lands and Forests, Hon. Maurice E. DeLory
 Minister of Agriculture and Marketing, Hon. John Hawkins.

4.3.1.4 New Brunswick

The government of New Brunswick has a Lieutenant-Governor, an Executive Council and a Legislative Assembly. The Honourable H.J. Robichaud, sworn in October 8, 1971, is the present Lieutenant-Governor. The Legislature elected October 26, 1970 is the forty-seventh in New Brunswick's history and the twentieth since Confederation. It has 58 members, at present 32 Progressive Conservatives and 26 Liberals, elected for a statutory term not to exceed five years.

The Premier receives \$25,000 per annum in addition to the salary for any other portfolio he may hold. Each Cabinet Minister is paid \$16,000; each member of the Legislative Assembly receives \$8,000 and a \$2,500 allowance for expenses. The Leader of the Opposition receives an additional \$16,000. The Speaker and Deputy Speaker are paid \$5,000 and \$2,500, respectively, in addition to the regular indemnity.

The twenty-fourth Ministry of New Brunswick as at December 31, 1972

Premier, Hon. Richard Hatfield
 Minister of Justice, Hon. John B.M. Baxter
 Minister of Finance, Hon. Jean-Maurice Simard
 Chairman of Treasury Board, Hon. Jean-Paul LeBlanc
 Provincial Secretary, Hon. Omer Léger
 Minister of Supply and Services, Hon. Carl Mooers
 Minister of Highways, Hon. Wilfred Bishop
 Minister of Natural Resources, Hon. A. Edison Stairs
 Minister of Agriculture and Rural Development, Hon. J. Stewart Brooks
 Minister of Health, Hon. Lawrence Garvie
 Minister of Social Services, Hon. Brenda M. Robertson

Minister of Labour, Hon. Rodman E. Logan
 Minister of Education, Hon. J. Lorne McGuigan
 Minister of Municipal Affairs, Hon. Horace B. Smith
 Minister of Economic Growth, Hon. Paul S. Creaghan
 Minister of Fisheries and Environment, Hon. G.W.N. Cockburn
 Minister of Youth, Hon. Brenda M. Robertson
 Minister of Tourism, Hon. Jean-Paul LeBlanc, acting
 Minister of New Brunswick Electric Power Commission, Hon. J. Stewart Brooks, acting.

4.3.1.5 Quebec

The government of Quebec consists of a Lieutenant-Governor, an Executive Council and a National Assembly. The current Lieutenant-Governor is the Honourable Hugues Lapointe, commissioned to office February 22, 1966. The National Assembly has 108 members elected for a maximum period of five years. Party standings in the twenty-ninth Legislature elected April 29, 1970 were: Liberal 72; *Union Nationale* 17; Social Credit 12; and *Parti Québécois* seven.

Each member of the National Assembly receives a sessional indemnity of \$15,000 and an expense allowance of \$7,000. In addition to this indemnity and allowance, the Prime Minister is paid \$20,000 annually and members of the Cabinet \$19,000. Each also receives a \$3,000 representation allowance. Ministers without portfolio receive an annual indemnity of \$12,000 with a representation allowance of \$3,000. The Chief Whips and parliamentary assistants are paid an annual indemnity of \$3,500 and a representation allowance of \$1,500. The Speaker of the National Assembly receives an indemnity of \$14,000, and a representation allowance of \$3,000; the Deputy Speaker receives an indemnity of \$6,000 and a representation allowance of \$2,000. The Leader of the Opposition is paid an indemnity of \$15,000, and a representation

allowance of \$3,000. Legislation passed on July 7, 1971 provides for payment of a \$6,000 indemnity and a \$2,000 supplementary allowance to the leader in the National Assembly of any opposition party having elected at least 12 members or having obtained 20% of the total vote in Quebec at the last general election.

A member is entitled to a maximum of \$200 per month for expenses incurred in maintaining an office in his constituency if the government does not provide one. Members are entitled to reimbursement of expenses incurred in maintaining in Quebec or its immediate vicinity a second residence which they would not require had they not been elected to the Assembly, or for trips to Quebec, in an amount not exceeding \$200 per month.

The twenty-sixth Ministry of Quebec as at December 31, 1972

Prime Minister, Robert Bourassa
 Deputy Prime Minister and Minister of
 Intergovernmental Affairs, Gérard D. Lévesque
 Minister of Roads, Minister of Public Works and
 Minister of Transport, Bernard Pinard
 Minister of Cultural Affairs, Mme Claire
 Kirkland-Casgrain
 Minister of Social Affairs, Claude Castonguay
 Minister of Justice, Jérôme Choquette
 Minister of Industry and Commerce, Guy St-Pierre
 Minister of Finance, Raymond Garneau
 Minister of Municipal Affairs, Maurice Tessier
 Minister of Financial Institutions, Companies and
 Cooperatives, William Tetley
 Minister of Agriculture and Colonization,
 Normand Toupin
 Minister of Natural Resources, Gilles Massé
 Minister of Lands and Forests, Kevin Drummond
 Minister of Education, François Cloutier

Minister of Communications, Jean-Paul L'Allier
 Minister of Revenue, Gérald Harvey
 Minister of Labour and Manpower and Minister
 responsible for the Civil Service, Jean Cournoyer
 Minister of Immigration and Minister responsible
 for the Manpower Branch of the Department of
 Labour and Manpower, Jean Bienvenue
 Minister of Tourism, Fish and Game, Claude
 Simard
 Minister responsible for the Autoroutes Authority
 of Quebec, Georges E. Tremblay
 Minister of State for Intergovernmental Affairs,
 Minister of State for Finance and Minister of
 State for the Civil Service, Oswald Parent
 Minister of the Environment, Victor C. Goldbloom
 Minister of State responsible for the Eastern
 Quebec Development Bureau, Robert
 Quenneville
 Minister of State for Roads, Raymond Mailloux.

4.3.1.6 Ontario

The government of Ontario consists of a Lieutenant-Governor, an Executive Council and a Legislative Assembly. Since his appointment effective July 4, 1968, the Honourable W. Ross Macdonald has been Lieutenant-Governor. The Legislative Assembly is composed of 117 members elected for a statutory term not to exceed five years. At the general election October 21, 1971, 78 Progressive Conservatives, 20 Liberals and 19 New Democrats were elected to the province's twenty-ninth Legislature.

In addition to the regular ministries there are the following provincial agencies: the Niagara Parks Commission, the Ontario Municipal Board, The Hydro-Electric Power Commission of Ontario, the Ontario - St. Lawrence Development Commission, the Ontario Northland Transportation Commission, the Liquor Control Board, the Liquor Licence Board, the Hospital Services Commission and The Water Resources Commission.

Under the provisions of the Legislative Assembly Act (RSO 1960, c.208 as amended) each member of the Assembly is paid an annual indemnity of \$12,000 and an expense allowance of \$6,000. In addition, the Speaker receives a special annual indemnity of \$5,000, the Chairman of the Committee of the Whole \$4,000 and the Leader of the Opposition a salary of \$15,000. Each member of the Cabinet having charge of a ministry receives the ordinary indemnity as a member of the Legislature in addition to his salary as a Minister of the Crown. The salary provided in the Executive Council Act for the Prime Minister is \$20,000 and for a Cabinet Minister having charge of a ministry \$15,000. By the 1956 amendment, Ministers of the Crown who are in charge of ministries, the Minister of the Crown who is a member of The Hydro-Electric Power Commission of Ontario, and the Leader of the Opposition each receives a representation allowance of \$2,000 per annum. Each Minister without portfolio, other than that Minister who is a member of The Hydro-Electric Power Commission, receives \$5,000 salary and \$1,000 representation allowance per annum.

The eighteenth Ministry of Ontario as at December 31, 1972

Premier and President of the Council, Hon.
 William G. Davis
 Provincial Secretary for Social Development, Hon.
 Robert Welch

Provincial Secretary for Resources Development,
 Hon. A.B.R. Lawrence
 Solicitor General, Hon. John Yaremko
 Minister of Revenue, Hon. Allan Grossman

 Treasurer of Ontario and Minister of Economics and Intergovernmental Affairs, Hon. Charles MacNaughton
 Minister of the Environment, Hon. James A.C. Auld
 Minister of Community and Social Services, Hon. René Brunelle
 Attorney General, Hon. Dalton A. Bales
 Minister of Education, Hon. Thomas L. Wells
 Minister of Labour, Hon. Fern Guindon
 Minister of Industry and Tourism, Hon. John White
 Provincial Secretary for Justice, Hon. George A. Kerr

Minister of Correctional Services, Hon. C.J.S. Apps
 Minister of Transportation and Communications, Hon. Gordon Carton
 Minister of Natural Resources, Hon. Léo Bernier
 Chairman of the Management Board of Cabinet, Hon. Eric A. Winkler
 Minister of Government Services, Hon. James W. Snow
 Minister of Health, Hon. Richard T. Potter
 Minister of Consumer and Commercial Relations, Hon. John T. Clement
 Minister of Colleges and Universities, Hon. Jack McNie
 Minister without portfolio, Hon. Margaret Birch
 Minister without portfolio, Hon. Claude Bennett.

4.3.1.7 Manitoba

In addition to a Lieutenant-Governor, Manitoba has an Executive Council at present composed of 14 members and a Legislative Assembly of 57 members elected for a maximum term of five years. The Honourable William John McKeag has been Lieutenant-Governor since July 3, 1970. As a result of the general election June 25, 1969, 28 New Democrats, 22 Progressive Conservatives, four Liberals, one member of the Social Credit party, one Liberal Democrat and one Independent were elected to the twenty-ninth Legislature.

The Premier of the province is paid a salary of \$16,600 per annum and each of the other members of the Cabinet \$15,600. Members of the Legislature are each paid a sessional indemnity of \$7,200 and a tax-free expense allowance of \$2,400. Each member attending the session and representing a constituency that is not wholly within the metropolitan area receives an additional allowance of \$600 for expenses incidental to the discharge of his duties as member. The Leader of the Opposition is paid \$15,600. The Speaker of the Legislative Assembly receives an additional indemnity of \$5,000 and expenses not exceeding \$1,000 in aggregate. The Deputy Speaker receives an additional indemnity of \$2,500 and expenses not exceeding \$500 in aggregate. Members required to live away from home receive a per diem allowance of \$15 for each day from the opening of the session to prorogation excepting days during an adjournment of the Assembly for a period of four or more continuous days.

The sixteenth Ministry of Manitoba as at December 31, 1972

Premier, President of the Council, Minister charged with the administration of the Manitoba Hydro Act, Minister of Dominion-Provincial Relations and Minister of Finance, Hon. Edward Schreyer
 Minister of Labour, Railway Commissioner of Manitoba and Minister charged with the administration of the Civil Service Act, the Civil Service Superannuation Act and the Public Servants Insurance Act, Hon. Russell Paulley
 Attorney-General and Minister of Consumer, Corporate and Internal Services, Hon. A.H. Mackling

 Minister of Agriculture and Minister of Co-operative Development, Hon. Samuel Uskiw

Minister of Colleges and Universities Affairs, Hon. Saul A. Miller
 Minister of Health and Social Development, Hon. René E. Toupin
 Minister of Industry and Commerce, Hon. Leonard S. Evans
 Minister of Highways, Hon. Peter Burtiak
 Minister of Municipal Affairs, Hon. Howard R. Pawley
 Minister of Education, Hon. Ben Hanuschak
 Minister of Public Works, Hon. Russell Doern
 Minister of Tourism, Recreation and Cultural Affairs, Hon. Laurent L. Desjardins
 Minister of Northern Affairs, Hon. Ronald McBryde.

4.3.1.8 Saskatchewan

The government of Saskatchewan consists of a Lieutenant-Governor, an Executive Council and a Legislative Assembly. Since February 3, 1970 the Honourable Stephen Worobetz has been Lieutenant-Governor. The statutory number of members of the Legislative Assembly is 60, elected for a maximum term of five years. At the general election June 23, 1971, 45 New Democrats and 15 Liberals were elected to form Saskatchewan's seventeenth Legislature, which opened July 28, 1971 and is still in session.

The Premier receives \$20,000 and each Cabinet Minister \$15,000 annually in addition to a sessional indemnity and allowance. The Leader of the Opposition receives \$15,000 plus an office allowance of \$24,000 per annum, the Speaker \$5,000 and the Deputy Speaker \$3,000.

Each member of the Legislature is paid a sessional indemnity of \$6,000, an expense allowance of \$4,000 and a sessional allowance of \$2,500. Each of the members for the three northernmost constituencies of Prince Albert East, Athabasca and Meadow Lake receives a \$6,500 sessional indemnity and a \$3,750 expense allowance. Government and Opposition Whips are paid an annual allowance of \$1,000 each and legislative secretaries an annual allowance of \$3,000 each.

The eleventh Ministry of Saskatchewan as at December 31, 1972

Premier, President of the Council, Hon. A.E.

Blakeney

Attorney General, Hon. Roy J. Romanow

Minister of Agriculture, Hon. John R. Messer

Minister of Public Health, Hon. Walter E. Smishek

Minister of Municipal Affairs, Hon. Everett I.

Wood

Minister of Labour, Hon. Gordon T. Snyder

Minister of Northern Saskatchewan and Minister

Consumer Affairs and Provincial Secretary,

Hon. Edwin Tchorzewski.

4.3.1.9 Alberta

In addition to the Lieutenant-Governor (since January 1966 the Honourable J.W. Grant MacEwan) the government of Alberta is composed of an Executive Council and a Legislative Assembly of 75 members elected for a maximum period of five years. On August 30, 1971, 49 Progressive Conservatives, 24 members of the Social Credit party, one New Democrat and one Independent were elected to form the seventeenth Legislature.

Each member of the Legislative Assembly receives a sessional indemnity of \$9,000, a \$4,500 expense allowance and \$30 for each day during the session when the member is necessarily absent from his ordinary place of residence. In addition to the indemnity and expense allowance, the Speaker receives a salary of \$8,000 and the Deputy Speaker \$5,000. The Leader of the Opposition's salary in addition to the indemnity and expense allowance is \$22,000. The Speaker, Deputy Speaker and Leader of the Opposition also receive \$30 for each day during the session when they are necessarily absent from their ordinary place of residence. In addition to the sessional indemnity and allowance the Premier receives \$27,000, other Ministers \$22,000 and Ministers without portfolio \$16,000.

The tenth Ministry of Alberta as at December 31, 1972

Premier and President of the Executive Council,

Hon. Peter Lougheed

Minister of Agriculture, Hon. Hugh M. Horner

Minister of Federal and Intergovernmental Affairs,

Hon. Donald R. Getty

Minister of Education, Hon. Louis D. Hyndman

Provincial Treasurer, Hon. Gordon T.W. Miniely

Horst A. Schmid

Minister without portfolio, Hon. W. Helen Hunley

Minister without portfolio, responsible for

Tourism, Hon. Robert W. Dowling

Minister without portfolio, responsible for Rural

Development, Hon. George Topolnisky

Minister without portfolio, responsible for

Northern Development, Hon. J. Allen Adair.

4.3.1.10 British Columbia

The government of British Columbia consists of a Lieutenant-Governor, an Executive Council and a Legislative Assembly. Since July 2, 1968 the position of Lieutenant-Governor has been held by Colonel the Honourable J.R. Nicholson. The Legislative Assembly has 55 members who are elected for a term not to exceed five years. Following the August 1972 election, the thirtieth Legislature opened October 17, 1972 with 38 New Democrats, ten Social Credit members, five Liberals and two Progressive Conservatives sitting in the Assembly.

Each member of the Executive Council and the Legislative Assembly receives a sessional allowance of \$5,000, \$2,500 for expenses, a living allowance of \$2,000 (based on a per diem rate of \$50, not exceeding 40 days), an allowance of 25 cents per mile of the distance between his place of residence and the city of Victoria, reckoning such distance, going and coming, according to the nearest mail route, and \$500 for telegraph and telephone expenses. In addition, the Premier is paid an annual salary of \$23,000, each member of the Executive Council with a portfolio \$20,000 and each member of the Executive Council without portfolio \$17,500. The Leader of the Opposition and the Speaker receive special allowances of \$9,000 for expenses; the Deputy Speaker receives a special allowance of \$3,500.

The thirtieth Ministry of British Columbia as at December 31, 1972

Premier, President of the Council and Minister of

Finance, Hon. David Barrett

Provincial Secretary and Minister of Travel

Industry, Hon. Ernest Hall

Attorney-General and Minister of Industrial

Development, Trade and Commerce, Hon.

Alexander Barrett Macdonald

Minister of Lands, Forests, and Water Resources

and Minister of Recreation and Conservation,

Hon. Robert Arthur Williams

Minister of Agriculture, Hon. David Daniel

Stupich

Minister of Mines and Petroleum Resources, Hon.

Leo Thomas Nimsick

Minister of Highways, Hon. Robert Martin

Strachan

Minister of Labour, Hon. William Stewart King

Minister of Education, Hon. Eileen Elizabeth

Dailly

Minister of Municipal Affairs and Minister of

Commercial Transport, Hon. James Gibson

Lorimer

Minister of Health Services and Hospital

Insurance, Hon. Dennis Geoffrey Cocke

Minister of Public Works, Hon. William Leonard

Hartley

Minister of Rehabilitation and Social

Improvement, Hon. Norman Levi

Member of the Executive Council without

portfolio, Hon. Frank Arthur Calder.

4.3.2 Territorial governments

4.3.2.1 Yukon Territory

The Yukon was established as a separate territory in 1898 to meet a need for local government created by the influx of miners during the gold-rush period. The Yukon Territory Act provided for a Commissioner and a Council of not more than six, all appointed by the Governor in Council. The Commissioner in Council was given legislative powers comparable to those held by the Lieutenant-Governor and the Legislative Assembly of the Northwest Territories. By 1902, five elected councillors had been added and in 1908 a fully elected Council of ten members was introduced. A population decline following the end of the gold rush was accelerated by enlistment during World War I and in 1919 the Council was reduced to three elected members. This remained the level of government until after World War II when population and economic activity again showed an increase, beginning with the building of the Alaska Highway. In 1960, the Council was increased to seven elected members and provision was made for the appointment of an Advisory Committee on Finance.

A principal feature of territorial government is its very close constitutional and working relationship with the Government of Canada. Although the provinces and the federal government each has jurisdiction and powers allocated by the British North America Act, the authority of the territorial government is allocated only by federal legislation. The Yukon Act prescribes the structure of the executive, legislative and judicial branches of the territorial government and the scope of their authority; all residual matters remain under federal control. The Yukon Territory has fully representative but not responsible government. Under authority of the Act, Whitehorse was designated as the seat of government in 1953.

The Government Organization Act, 1966, which describes the responsibilities of the Department of Indian Affairs and Northern Development for the development of northern

Canada, is the other piece of basic legislation under which the territorial government operates. The Minister is responsible for the management of the natural resources, except game, and for the development of the North generally. Although he shares authority with the Governor in Council for directing the Commissioner in his duties, he is the effective link between the territorial and federal governments.

The Executive. The executive side of the territorial government is headed by a Commissioner appointed by the federal government. He is directed to administer the government of the Yukon Territory under instruction from the Governor in Council or the Minister of Indian Affairs and Northern Development. In practice, the Commissioner is much more responsive to the wishes of his elected Council than the Yukon Act implies and he cannot spend any territorial funds which have not been voted by Council. A growing body of territorial ordinances require Council approval for specific actions; in practice, the Commissioner never acts on any major issue without consulting Council.

Because the Commissioner does not sit with Council, the Yukon Act was amended in 1960 to bridge the gap between the executive and legislative functions of government at Council sessions. The amendment provided for the formation of an Advisory Committee on Finance composed of three members of Council appointed by the Commissioner on the advice of Council. Another step to harmonize the executive and legislative functions of government was the formation in November 1970 of an Executive Committee consisting of the Commissioner as chairman and four members: the Assistant Commissioner (Executive) and Administrator of the Yukon Territory as vice-chairman, the Assistant Commissioner (Administrative) and two members of Council to be appointed by the Commissioner on the recommendation of the territorial Council. The two Council members on the Executive Committee are also members of the Advisory Committee on Finance, leaving the third member to be appointed by Council. As part of their administrative duties, one elected member is responsible for the Department of Education and the other for the Department of Health, Welfare and Rehabilitation.

Below the Commissioner's office, the territorial public service, comprising 1,000 persons including 265 teachers, is organized into ten conventional administrative departments under the direction of the Commissioner: all are located in Whitehorse. In outlying communities territorial government administration is represented by a limited number of territorial agents concerned with the sale of liquor and licences. Health facilities are administered mainly by the federal Department of National Health and Welfare, an involvement stemming from its responsibility for Indians in the Yukon and from practical administrative considerations. The territorial government directs education, under the territorial Department of Education, engineering services and the administration of certain welfare programs.

Some administrative areas such as natural resources, which are the responsibility of the Department of Indian Affairs and Northern Development, are administered by federal public servants. The Commissioner, in addition to his constitutional role in territorial government, is also the Department's senior federal representative in the Territory. The Minister of Justice is the Attorney General of the Yukon Territory for purposes of the Criminal Code of Canada, with responsibility for the administration of criminal justice in the Territory but not for civil matters, or the constitution or organization of the courts. Law enforcement is provided by the Royal Canadian Mounted Police and the contract for its services is negotiated by the territorial government.

A detailed discussion of the territorial court system is presented in Chapter 3.

The Legislature. The Legislative Council consists of seven members elected for a term of four years. In general, all persons resident in the Territory for one year prior to the date of enumeration and 18 years of age are eligible to vote. Three of the members represent electoral districts located in or close to Whitehorse where about half of the some 20,000 residents of the Territory live. As in many other matters, a federal agency, the Office of the Chief Electoral Officer, conducts the territorial elections as a free service to the Territory. Council normally meets in session twice each year. The first session commences in January and as a major part of its work votes on the main territorial estimates, prepared by the Commissioner and approved by Council's Advisory Committee on Finance and the Minister of Indian Affairs and Northern Development. The second session is usually called in November and special sessions can be held at any time. Main sessions last from one to two months and the debates are recorded verbatim and published under the title of *Votes and proceedings*.

The Commissioner calls Council into session and prorogues it; he sits with it only by invitation to explain or defend proposed expenditures, draft legislation or policy papers which he has placed before Council. All sessions are presided over by a Speaker who is appointed by Council from among its members for the duration of each Council but is given no specific responsibilities or authority under the Yukon Act. In practice, he conducts Council proceedings under Rules of Council which are an adaptation of Canadian parliamentary procedures. A Clerk of Council controls the administrative side of its proceedings.

The matters on which Council can legislate are not significantly fewer than those enjoyed by the provinces. The main exceptions concern natural resources. These are a responsibility of the federal government which has to provide the heavy investments in transportation and other facilities needed to bring them into production. Most major policy matters are first placed before Council in the form of a Sessional Paper prepared by the Commissioner, and the draft legislation is then presented at the next session in the form of a Bill, although amendments to existing legislation may be processed concurrently with the Sessional Paper or without the assistance of this background information. Discussion is usually conducted with the Council resolved into Committee of the Whole, making it possible for the Commissioner, heads of departments and outside specialists to appear to give detailed information and advice on the subject concerned. Bills are given three readings and require the assent of the Commissioner before they become law as ordinances of the Territory. The Commissioner can reserve assent to legislation but rarely does so. As with provincial legislation, the federal government may disallow any ordinance within one year. New ordinances are published after each session; consolidated ordinances of the Yukon Territory are usually revised every ten years.

The role of the federal government. Direct federal involvement in the affairs of the territorial government extends from control of its constitution to responsibility for the operation of certain provincial-type services and for providing most of its finances. Beyond these special services, the federal government provides the usual range of national services such as the operation of Canadian Broadcasting Corporation radio stations, mail delivery and mainline airports. Full assistance under all national welfare programs is available in the Territory. Even with special financial assistance in many particular areas, the low volume of local revenues falls far short of meeting the high cost of services provided by the territorial government. The federal government picks up this financial deficit through annual fiscal arrangements known as Federal-Territorial Financial Agreements. The amount of federal financial assistance given to the territorial government is simply the difference between the forecast of revenues available to the territorial government and the forecast of the cost of a reasonable level of services to be provided by that government. In return, the territorial government forgoes any exercise of its authority to tax private and corporate incomes and to collect other corporation taxes and succession duties.

Apart from special accounts such as housing loans and amortization of borrowings from the federal government for which individual arrangements are made, the Yukon government in the year ended March 31, 1972 spent \$18.9 million on operating accounts and another \$5.1 million on capital projects. Of the total expenditure, the territorial government raised \$6.7 million locally and recovered another \$6.6 million from the federal government via shared-cost programs. The remainder was provided by the federal government under its financial agreement with the Territory.

Commissioner, Council and Council staff of the Yukon Territory as at December 31, 1972

Commissioner, J. Smith

Clerk of the Council, C.W. Pearson

Legal Adviser, P. O'Donoghue

Executive Committee: J. Smith, chairman; G.A.

Chamberlist, members

Members of the Council: Hilda Watson, Mike

Stutter, Donald E. Taylor, Ronald A. Rivett,

Norman S. Chamberlist, Clive Tanner, John

Kenneth McKinnon.

4.3.2.2 Northwest Territories

The Temporary Government Act of 1869 was the first legislation by the federal government to establish government in the newly acquired Rupert's Land and North-Western Territory. However, functional territorial government really dates from the North-West

Territories Act of 1875. The creation of Saskatchewan and Alberta in 1905 and the adjustment of the northern boundaries of Manitoba, Ontario and Quebec by 1912 pushed the Northwest Territories north of the 60th parallel. The 1905 legislation provided for a federally appointed Commissioner with wide executive and legislative powers and a Council of four but no councillors were appointed for 16 years. In 1921 the Council was expanded to six members and, until the first appointment of a territorial resident in 1946, it was composed entirely of senior federal officials.

Defence early warning systems, radio and greatly improved air transportation after World War II ended the extreme isolation of the North and pressures for improved territorial government soon followed. Legislative changes in 1951 and 1952 increased Council membership to eight, three of them elected from the Mackenzie District. A fourth was added in 1954. At least two Council sessions were required to be held in a year, one in the Territories and all others at the seat of government in Ottawa. The subjects on which the Commissioner in Council could legislate were increased to approximate those of the provincial legislatures except that natural resources other than game were reserved to the federal government. A Territorial Court was established in 1952.

Recent constitutional developments. The quickening of federal interest in the North in the 1950s and 1960s stimulated concern and effort to arrange for a resident territorial government and to chart the course of its future development. An amendment to the Northwest Territories Act in 1966 created three new electoral districts in the eastern Arctic and, for the first time, gave elected representation to all residents of the Territories. Also, at the ensuing election the first Eskimo was elected to the territorial Council. A separate consolidated revenue fund was set up for the territorial government and wider powers in other areas of financial administration were introduced.

Meanwhile, in 1965, the federal government had appointed an Advisory Commission on the Development of Government in the Northwest Territories which travelled widely in the North to examine the local needs for change. Following receipt of its recommendations in 1966, the federal government acted quickly to provide for a territorial administration resident in the Northwest Territories. Yellowknife was designated as the seat of territorial government. In June 1970, the federal government passed amendments to the Northwest Territories Act changing the number of elected Council members from seven to ten and decreasing the number of appointed members from five to four. The amendments also extended the life of Council from three to four years, permitted Council to set its own indemnities and to establish the voting age in territorial elections (now set at 18 years subject to a one-year residence requirement), and reduced the period of federal disallowance of territorial ordinances from two years to one.

Changes in territorial administration. Unlike the Yukon Territory, which has had its own public service since the turn of the century, the government of the Northwest Territories, until recently, has been largely dependent on the federal government for staff to implement its legislation and to operate its public services. Until 1963, the Deputy Minister of Northern Affairs (now Indian Affairs and Northern Development) was Commissioner, and the Northern Administration Branch of that Department was devoted to operating most government services in the Northwest Territories with federal public servants. In that year, a full-time Commissioner was appointed and charged with building up a territorial administration located initially in Ottawa. In September 1967 the Commissioner and about 50 staff members moved to Yellowknife and immediately assumed responsibility for the game management service, municipal affairs, the issuing of all licences, tax collection and the operation of the liquor system (already staffed by territorial contract employees). Operational responsibility for other government services was transferred from federal to territorial control in the Mackenzie District on April 1, 1969, and in the eastern Arctic on April 1, 1970. The territorial government is structured to carry out its administration through seven line and three service departments, each under the direction of a senior public servant reporting to the Executive which consists of the Commissioner, the Deputy Commissioner and the Assistant Commissioner. The field staff is organized into four regions with regional directors at Fort Smith, Inuvik, Frobisher Bay and Churchill.

Present government structure. The Northwest Territories Act, 1952, as amended, provides for an executive, legislative and judicial structure. The Commissioner is the chief executive

officer, appointed by the federal government and responsible for the administration of the Northwest Territories under the direction of the Minister of Indian Affairs and Northern Development. In practice, all major policy decisions are taken on the advice of this Council. The Commissioner can spend funds only to the extent voted by Council and all new revenue measures are subject to Council approval. Normally, the Commissioner obtains prior federal approval of proposed legislative and budgetary measures before submitting them to Council.

The Council of the Northwest Territories consists of ten elected and four appointed members and has a life of four years. It meets at least twice a year, usually for a period of three weeks, but more often if required. The Commissioner presides over Council sessions and the Deputy Commissioner sits as an appointed member. A Clerk of Council and a Legal Adviser provide the main administrative assistance and debates are recorded verbatim.

The Northwest Territories Act gives the territorial Council authority to legislate in most provincial areas of government activity except for natural resources other than game; these are reserved to the federal government which alone can provide the necessary development funds. Legislation must receive three readings and have the assent of the Commissioner; he can reserve assent but this is a rare occurrence and the federal government may disallow any ordinance within one year. The Commissioner proposes most legislation but private members' Bills are allowed except for money matters which are the prerogative of the Commissioner. Besides draft legislation, the Council gives considerable time to policy papers in which the Commissioner asks for advice or seeks authority to take a particular course of action.

The Minister of Justice is the Attorney General of the Northwest Territories under the Criminal Code of Canada, with responsibility for the criminal administration of justice but not for civil matters, or the constitution or organization of the courts (see Chapter 3). Law enforcement is provided by the Royal Canadian Mounted Police.

Continuing federal responsibility. The Government Organization Act, 1966 charges the Minister of Indian Affairs and Northern Development with responsibility for the development of the North and for the general co-ordination of federal activities in the area. Other federal government agencies, such as the Northern Health Service of the Department of National Health and Welfare and the Royal Canadian Mounted Police, are responsible for health and police services with the territorial government sharing their costs. The Ministry of Transport operates mainline airports throughout the whole of the North: the Canadian Broadcasting Corporation provides special shortwave northern broadcasts and maintains a growing number of local stations in the Territories. Federal cost-shared national assistance programs, within the competence of the territorial government, are available to it on the same conditions as to the provinces.

There are about 7,000 Indians and 13,000 Eskimos in the Northwest Territories for whom the federal government has a special responsibility. Although there are no Indian reserves in the Territories, two treaties were entered into which established certain claims to land and certain other rights. As in the provinces, legislative authority with respect to Indians and lands reserved for Indians is vested exclusively in the federal government and this authority extends to Eskimos.

Extensive financial assistance is given to the territorial government under special federal-territorial agreements, usually spanning a period of five years. These agreements serve both to allocate the financial responsibility of each government for the provision of services in the Territories and to fix the amount of the federal financial payments to the territorial government for the life of the agreement. At the present stage of development, territorial revenues fall far short of meeting the expenditures of the territorial government. Under the financial agreements, all taxes on personal and corporate incomes, corporation taxes and succession duties are reserved to the federal government.

Excluding amortization of borrowings, the territorial government, during the year ended March 31, 1972, spent about \$70 million on operating accounts and about \$21 million on capital projects. Of these expenditures, approximately \$10 million was raised within the Territories through taxes, licences and liquor revenues and \$11.5 million was recovered from residents of the Territories for services supplied. A further \$4.5 million was recovered under federal shared-cost programs. The remainder was provided by the federal government as special operating grants and loans under the financial agreement and under the special arrangements relating to the move to the seat of government in Yellowknife.

Commissioner, Council and Council staff of the Northwest Territories as at December 31, 1972

Searle.

4.4 Local government

Local government in Canada comprises all government entities created by the provinces and territories to provide services that can be more effectively discharged through control at the local level. Broadly speaking, local government services are identified in terms of nine main functions — protection, transportation, environmental health, public health, welfare, environmental development, recreation, community services and education. In addition, local government, through the medium of government enterprises, may operate such facilities as public transit and the supply of electricity and gas. Education is normally administered separately from the other local functions.

Many local government organizations antedate Confederation but under the British North America Act local government was made a responsibility of the provincial legislatures, a responsibility subsequently extended to the territories when their governments were constituted in the present forms. The unit of local government, apart from the school board, is usually the municipality which is incorporated as a city, town, village, township or other designation depending on the province. The powers and responsibilities of municipalities are those delegated to them by statutes passed by their respective provincial or territorial legislatures. Some of these statutes apply to all municipalities within a province, some to a certain type or group, and many to one municipality only.

Rapid and continuing urbanization during the past two decades and the demand for services in rural areas comparable to those available in urban areas have placed great strains on local government. These strains have been aggravated by the inelasticity of the major local revenue source — the taxation of real property; at the same time, the small populations of most municipalities have hindered attempts to provide services that require economies of scale for efficient operation.

The provinces have taken a number of steps to assist local governments to meet these challenges. An increasing number of special agencies or joint boards and commissions have been created to provide certain services for groupings of municipalities. Local government revenue has been supplemented by grants from the provinces, either made unconditionally or for specific purposes. Certain functions traditionally assigned to local government have been assumed in whole or in part by the provinces. Besides encouraging the amalgamation of small units, the provinces have also established new levels of local government to provide services which can be better discharged at a regional level. "Second-tier" local governments now cover the whole of British Columbia and are planned for all of Ontario, where five now exist, and for Quebec, where three have been established. What may become a pattern for the next stage in municipal development was established in Manitoba on January 1, 1972 when the Metropolitan Corporation of Greater Winnipeg and its constituent municipalities were amalgamated into a single city.

The major local revenue source available to local government is the taxation of real property, supplemented in varying degrees by taxation of personal property, businesses and amusements. Revenue is also derived from licences, permits, rents, concessions, franchises, fines and surplus funds from municipal enterprises.

Since a description of all forms of local government would be too complex for easy comprehension, the following paragraphs describe only municipal organization in each province and in the territories as at January 1, 1972. Table 4.6 gives the total number of each type of municipality in each province and territory.

Newfoundland. At January 1, 1972, Newfoundland had 253 incorporated areas comprising two cities, 83 towns, four rural districts, 49 local improvement districts, 114 local government communities and one metropolitan area. The towns, rural districts and local improvement districts operate under the Local Government Act; towns and rural districts have elected

councils and local improvement districts have appointed trustees. Local government communities are established under the Community Councils Act in the smaller settlements and have limited powers and functions. The St. John's Metropolitan Area, incorporated under a special Act, covers the area adjoining and surrounding the city of St. John's and the town of Mount Pearl and is similar in organization to a local improvement district. There are no rural municipalities in the usual sense. Only about one fifth of one percent of the total area is municipally organized. Municipalities are supervised by the Department of Municipal Affairs and Housing.

Prince Edward Island. In this province, one city and seven towns have been incorporated under special Acts and 24 villages have been established under the Village Services Act. There is no municipal organization for the remainder of the province, although it is divided into three counties which are subdivided into school sections with elected school boards. The organized municipalities are administered by the Department of Community Services.

Nova Scotia. This province is geographically divided into 18 counties; 12 of these constitute separate municipalities and the remaining six are each divided into two districts or municipalities, making a total of 24 rural municipalities. Within and under the jurisdiction of these municipalities there are 25 incorporated villages that provide limited services. In addition, there are three cities operating under special charters and special legislation and 38 towns operating under the Town Incorporation Act. Although geographically located within counties or districts, cities and towns are entirely independent of them except as to joint expenditures. There is no part of the province that is not municipally organized. Supervision of municipalities is exercised through the Department of Municipal Affairs.

New Brunswick. In New Brunswick municipal organization now includes six cities, 21 towns and 94 villages. The remainder of the province is not municipally organized and is administered by the provincial government. There are 192 unincorporated local service districts established to provide services that are municipal in nature but these are administered by the Department of Municipal Affairs and are not municipal organizations. Municipalities are supervised by the Department of Municipal Affairs.

Quebec. The more densely settled areas of Quebec, comprising about one third of the area of the province, are municipally organized; the remainder is governed by the province as "territories". The organized area is divided into 74 county municipalities which look after matters of general interest within the county. Cities and towns are excluded from the county system for political and administrative purposes except for certain joint expenditures. The remaining municipal corporations and the unorganized territory within counties fall under the county system. The counties have no direct powers of taxation; funds to finance the services falling within their jurisdiction are provided by the municipalities forming part thereof. The municipalities are governed by Special Charter, by the Cities and Towns Act or by the Municipal Code. On January 1, 1972, there were 1,589 municipalities, comprising 67 cities, 197 towns, 283 villages, 504 parishes, 155 townships, 13 united townships and 370 municipalities without designation. Major municipal consolidations began in 1965 with the fusion of the 14 municipalities on Île Jésus into the new city of Laval. At the beginning of 1970, the Montreal and Quebec Urban Communities and the Outaouais Regional Community were established in which integration of services will be staged gradually. Supervision of and assistance to municipalities are through the Department of Municipal Affairs and the Quebec Municipal Commission.

Ontario. Slightly more than one tenth of Ontario's area includes 95% of its total population and is municipally organized; the remainder is under direct provincial administration. The settled section of the province is divided into one metropolitan municipality, three regional municipalities, one district municipality and 34 counties. In addition, there are 34 cities, six separated towns, five boroughs, 147 towns, 144 villages, 530 townships and 16 improvement districts. The Municipality of Metropolitan Toronto, in existence since January 1, 1954, encompasses one city and five boroughs, and is responsible for assessments, police, water supply, sewerage, metropolitan road systems, planning, etc. The regional municipalities of Ottawa - Carleton, York and Niagara have replaced the county administrations in their respective areas and assumed certain responsibilities over all the municipalities within their

boundaries. The District Municipality of Muskoka was incorporated on January 1, 1971 to assume responsibilities, similar to those of the regional municipalities, over the reorganized municipalities of the former district of Muskoka. This form of regional government in Ontario is also contemplated in other areas. Each county, although an incorporated municipality, comprises the towns (with the exception of six separated towns), villages and townships situated within it. Some municipalities are located outside the counties in areas called districts. These districts are in the western and northern parts of Ontario and are not municipal entities. Supervisory control of municipalities is exercised by the Department of Municipal Affairs and the Ontario Municipal Board under the Municipal Act and other Acts governing aspects of municipal government.

Manitoba. Manitoba has five cities, 33 towns, 41 villages and 105 rural municipalities. These are supervised by the Department of Municipal Affairs under the Municipal Act and special charters, except the Metropolitan Corporation of Greater Winnipeg which is under the jurisdiction of the Department of Urban Affairs. There are 19 local government districts incorporated under the Local Government Districts Act where the province has placed a resident administrator to carry out the functions of a municipal council. The unorganized areas are the direct responsibility of the provincial government.

Saskatchewan. All municipalities in Saskatchewan derive their powers from general Acts that are designated with the name of the type of municipality. There are 11 cities, 131 towns, 356 villages and 292 rural municipalities. The area so organized consists of most of the southern part of the province, the remainder of this portion being administered by the province through nine unincorporated local improvement districts. The northern part is sparsely populated and some municipal services are provided by the province through the operation of the Northern Administration District. Municipalities are supervised by the Department of Municipal Affairs.

Alberta. This province has an Act applying to each type of municipality and, under these Acts, the Department of Municipal Affairs supervises the nine cities, 102 towns, 167 villages, 18 municipal districts and 30 counties. The counties administer schools in addition to municipal functions. There are 24 improvement districts administered directly by the Department of Municipal Affairs and three special areas under the Special Areas Board also responsible to the Department of Municipal Affairs.

British Columbia. In 1967, the government of British Columbia instituted regional government in the province and by January 1, 1972, 28 regional districts had been established. These regional districts are developing and are assuming responsibility for certain services from municipalities within their boundaries as well as providing services to previously unorganized areas. There are 31 cities, 14 towns, 60 villages and 39 districts. Districts are mostly rural although some adjacent to the principal cities of Vancouver and Victoria are largely urban in character. Municipalities are supervised by the Department of Municipal Affairs. In addition, there are unincorporated local districts supervised by the Department of Lands, Forests, and Water Resources that have been set up to provide certain municipal services such as protection, waterworks, irrigation, etc.

Yukon Territory and Northwest Territories. In the Yukon Territory, there are two cities, one village and three local improvement districts; the Northwest Territories includes one city, three towns and three hamlets. The local improvement districts in the Yukon and the hamlets in the Northwest Territories, although incorporated, are developmental forms of local government. Supervision of these municipalities is provided by the respective territorial governments.

4.5 Government economic planning agencies

4.5.1 The Economic Council of Canada

4.5.1.1 Organization

The Economic Council of Canada was established as an economic advisory body with broad terms of reference by Act of Parliament assented to on August 2, 1963. Its primary role is to advise and recommend how Canada can achieve the highest possible levels of employment and efficient production so that the country may enjoy a high and consistent rate of economic

growth and that all Canadians may share in rising living standards; to recommend what government policies will best help to realize the economy's potential for growth; to consider means of strengthening and improving Canada's international financial and trade position; and to study how national economic policies can best foster the balanced economic development of all areas of Canada.

The initial work of the Economic Council was built around five basic economic and social goals — full employment, a high rate of economic growth, reasonable stability of prices, a viable balance of payments, and an equitable distribution of incomes. In setting these objectives, the Council has faced a twofold challenge. Not only has it undertaken the difficult task of defining goals that have many complex aspects, but it has been very much aware of the necessity of making them consistent with one another, incorporating their many important and complicated interrelationships. The Council has also stressed repeatedly that its concern has been not with one predominant goal, but with simultaneous achievement of the whole set of interrelated goals.

The Council consists of up to 28 members appointed by the Governor in Council. These include a chairman and two directors, who serve full-time in their professional capacity, and 25 members selected from industry, labour, finance and commerce, agriculture and other primary industries, and the general public. No government officials are appointed to the Council. The chairman and the directors (one of whom may be elected as vice-chairman by the Council) are appointed for seven-year terms. The other members, who are appointed for three-year terms "after consultation with appropriate representative organizations", are intended to reflect a very wide diversity of interests from the different private sectors of the economy and different regions of the country. Nevertheless, they sit on the Council as individuals and not as delegates of particular organizations or groups. Their knowledge and practical experience is complemented by a research staff, plus administrative and auxiliary personnel. The Council is therefore a mixed body, served in its deliberations by professional staff.

4.5.1.2 The years to 1980

The Economic Council periodically undertakes an appraisal of Canada's economic potential over the medium-term future. In the *First*, *Fourth* and *Sixth annual reviews*, the Council published measures of the aggregate potential growth of the Canadian economy based on projections of the labour force, its distribution by age and sex, educational attainment, and the number of hours worked per week, along with estimates of the increase in the stock of capital and the rate of increase in productivity. In the *Ninth annual review*, the Council employed a sophisticated new analytical tool, the CANDIDE model (see below), to explore the period to 1980. A wide variety of assumptions were made concerning influences that could affect the development of the Canadian economy over this period. The Council chose to present a number of alternatives indicating what might be achieved. The Council examined six alternatives. In five of the six alternatives, a favourable external environment was assumed, with US growth at a rate as high as the 1960s and a somewhat higher rate of growth for overseas industrial economies. Each of these alternatives differed in terms of assumptions concerning fiscal policy with variations both in the level of government activity and in the type of government expenditure. In the sixth alternative, where a less favourable external environment was projected, partial compensation for reduced foreign demand was assumed in the form of a very high rate of increase in government transfers to persons.

In all of these alternatives, a relatively high rate of growth in over-all output of the economy is projected for this decade, ranging from an annual average rate of 5.5% to 5.7%, in comparison with 5.4% in the decade of the 1960s.

The rate of unemployment for the last five years of the decade ranges from an average of 3.8% to 4.3%. The rate of rise of prices over the decade, as reflected by the implicit deflator of gross national expenditure, ranges from 2.5% to 2.9% annually as compared with 3.2% over the preceding decade but this result is influenced by an assumption of no increase in the rate of indirect taxes and there is also no increase projected in interest rates. The projected increase in output per worker averages 2.4% annually as compared with 2.3% over the 1960s.

Each of these alternative growth patterns was deliberately designed to produce high employment in the second half of the 1970s and, therefore, a low unemployment rate, averaging 4.0% of the labour force. In making its projections, the Council estimated how to

proceed from the current economic situation to a fully employed situation with a minimum of delay while maintaining compatibility with acceptable cost and price stability. In addition to estimating long-run economic potential, however, the Council felt it was necessary to regularly reassess economic circumstances in the context of interim targets. This proposed framework of flexible performance indicators would be used, as the Council stated, "both as temporary objectives and as criteria for assessing progress". These national indicators are needed to ensure consistency among policies and to relate in a systematic way the past, the present and the future. They are particularly desirable in Canada in view of the wide regional disparities that exist and, in fact, necessary in view of the degree of decentralization of decision-making in the federal system.

The initial set of indicators proposed covers the years 1973 to 1975. They are meant to be used as an internally consistent group and not to be taken one by one in isolation. They are directed to both private and public decision-makers. In each of its subsequent annual reviews, the Council will revise and update these indicators in the light of actual developments in the economy. In addition to recommending the utilization of such a system of medium-term performance indicators, the Council made the following two recommendations as to the manner in which they should be used:

"... that each year one of the federal-provincial meetings of prime ministers or of ministers of finance be devoted to the medium-term performance indicators developed by the Economic Council of Canada and to an examination of their implications for the federal and provincial governments."

"... that a national economic conference be convened each year under appropriate auspices to bring together representatives of the various sectors of economic activity, both public and private, for assessing the medium-term economic prospects in the framework of performance indicators that will be published annually by the Economic Council of Canada."

4.5.1.3 Research program

A number of other research projects are under way at the Council; the projects discussed here represent the over-all program. Research may be pursued further on some topics than others and the results disseminated in a variety of ways: some studies will form the basis of major Council publications, while others may be used in staff and special studies or as internal working papers.

Canadian commercial policy study. International trade has always been of great importance for Canada, and will continue to be so in the 1970s. During this decade Canada, like other trading nations, will be faced with the necessity of adjusting to the effects of a number of far-reaching changes in the international economy. This study will focus on some of the major commercial policy options that may be open to this country in the light of these changes.

This study will begin by setting out the advantages and disadvantages of the three basic possibilities — higher protection, status quo, and lower protection — but will be followed by a more detailed analysis of options of a multilateral, bilateral, and unilateral nature. Major emphasis will be placed on the economic implications of these various options, including their possible effects on the various regions and industrial sectors of the economy.

The study will then link up with a broader economic policy framework by considering the implications of possible commercial policy changes for other policy fields, with particular emphasis on commercial policy as part of a broader and more general industrial strategy. In this context, policies relating to science and technology, the rationalization of industries, and adjustments to absorb the impact of trade policy changes on particular regions, industries, and occupational groups, will be examined.

The CANDIDE model. The CANDIDE (CANadian Disaggregated InterDepartmental Econometric) model is a large-scale econometric model developed by agencies and departments of the Government of Canada over the past several years. On April 30, 1970 a submission to the federal Treasury Board was made by the Economic Council of Canada, with the support of Statistics Canada and the Departments of Finance, Regional Economic Expansion, and Manpower and Immigration, for funds to finance the development of a medium-term econometric model of the Canadian economy. The model is now operational and has provided the basis for the Council's review of the economy and its future prospects in the *Ninth annual review*. A complete technical description of the model is available in a series of CANDIDE Project Papers.

The Council will continue to play a leading role in the maintenance and improvement of the existing model and will provide considerable research resources for this purpose. Work on

these improvements will involve further testing of the properties of the model and re-specification of some of the existing equations in the light of the results. Also, data revisions such as those of the national accounts will be incorporated.

In addition, further development of the model for policy applications will be undertaken by many of the organizations making use of it, especially government departments and agencies. This will involve extensive training of the users, and the Council will provide initial support in this area.

The construction reference. In Section 10 of the Council's Act, provision was made for the Council to study and give advice on a wide range of matters under special reference from the Minister. Work on the third such reference, an examination of "Cyclical instability in the construction industry", is now under way, and a report on the findings, with recommendations for improvement, will be issued upon completion of the research.

The long-term future. On March 15, 1972 the Council accepted in principle the recommendation of the Senate Special Committee on Science Policy "to devote more emphasis to the long-term future in its work".

As a first step, the Council will concentrate on future technological change in the broader context of the evolving social and economic environment. Foreign investment has promoted the importation of new products and processes developed abroad. It may also have resulted in curtailment of industrial research in Canada and a reduction in productive employment opportunities for people trained in Canadian universities. Particular attention will be devoted to the sources of innovation and to practical means of stimulating an increase in innovating activity. Also, consideration will be given to the time factor in terms of the lag between invention and prototype, pilot plant and commercial production, initial industrial application, and the broad acceptance of new processes and products.

Two of the Council's objectives will be to explore the sectoral implications of innovation and the impact of diffusing this innovation through the economy. Key sectors, such as transportation and communication, might warrant special attention because innovation in these industries would have an effect on many other industrial sectors. Identifying the sources, vehicles of diffusion, and impact of innovation will be the main thrust of this research.

Regional disparities. In a country such as Canada, with its wide regional differences, its highly decentralized system of private decision-making, and its constitutional system, which divides authority for economic policy decisions between the federal and provincial governments, national economic issues cannot be studied without consideration of regional implications. The Council, from its inception, has been concerned with the problem of regional economic disparity. Chapters in the *Second, Third, Fifth, and Sixth annual reviews* dealt with particular aspects of regional problems. In addition, two staff studies dealt in some detail with the question of interregional disparities in income. The Council must now reassess its approach to regional economic questions and envisage new directions for such research.

In this area the CANDIDE model is likely to provide a useful framework. Some work has already been undertaken on the feasibility of developing a peripheral regional model within the CANDIDE program. Strengthening the model in this way would provide a useful systematic basis for further regional research. The initial report, which provided a foundation for the CANDIDE model, contains some considerations to this effect. Subsequently, members of the research staff of the Department of Regional Economic Expansion (DREE) prepared a proposal for the development of such a regional model. They foresee preliminary results, not incorporating regional interactions, within a year. Also, they have outlined possible work on specific sectors that will increase the ability of the model to capture regional feedback with some accuracy. An arrangement for joint research by the Economic Council and DREE is under discussion.

Social indicators. In the *Eighth annual review*, the Council called for "the development of a comprehensive set of statistical measures to monitor the changing conditions of our society over a broad spectrum of concerns". These goal indicators were defined as information, compiled on a time-series basis, to measure relevant and significant dimensions of a specific goal area. Two types of indicators – Goal Output Indicators, and Goal Distribution Indicators – would give a broad summary view of levels and changes in output as well as the degree of distribution of the aggregate output among regions, income groups, etc. There is general agreement that the measures upon which government decisions presently rely are inadequate

for sound decision-making. Clearly, the availability of output-oriented social indicators with their socio-economic characteristics would have a positive effect on the quality of decision-making.

Social indicator work permits entry into a number of areas of concern. At the present time the Council is developing indicators in three fields — education, urban systems, and health — and intends to undertake work on indicators concerned with cultural and linguistic relationships. This choice should not be viewed as restrictive, since the testing and application of these indicators will lead to other areas as well. For example, using educational outputs as inputs in a labour force production function could provide additional information for the study of manpower policies. In a similar way this work would have a considerable impact in studies of poverty, the economics of leisure, etc. The Council's past concern with distribution questions would be continued in this program, since the most important aspect of an indicator, from a policy viewpoint, is not so much its aggregate value as its distributional dimensions.

Financial markets. Financial markets are an important element of the Canadian economy, and the Council proposes to undertake research in this field. The type of study envisaged would cover the topic from two broad perspectives. First, the structure and evolution of domestic capital markets would be analyzed and the capacity of these markets to meet the needs of Canadian lenders and borrowers assessed. Second, an examination of the external environment would relate the operations of foreign financial markets to Canadian requirements and study the impact on the economy of financial flows into and out of the country. The implications of such flows for Canada's internal and external balance would be considered.

Labour force and labour market. The Council will undertake a comprehensive study of the characteristics and structure of the labour force and labour market. Sources of information in these matters will be reviewed and an analysis conducted into how employment opportunities and the evolving system of social programs affect the supply of labour.

4.5.2 The Department of Regional Economic Expansion

When the Department of Regional Economic Expansion (DREE) was created in 1969 to integrate and develop federal efforts to overcome regional economic disparities, the establishing legislation authorized the Department to prepare and implement, in co-operation with other federal agencies and with provincial governments, development plans and programs designed to meet the special needs of areas where growth in both employment and incomes was lagging behind other parts of Canada. A second major legislative measure, the Regional Development Incentives Act (RSC 1970, c.R-3), provides a program of industrial incentives to encourage manufacturing and processing industries to establish, expand or modernize in designated parts of the country where new jobs are needed. The original designated regions included all of the Atlantic region except Labrador, much of eastern Quebec, and parts of every other province.

The Act was amended in December 1970 to provide for incentives to regional development in the form of loan guarantees for manufacturing and processing facilities and selected new commercial operations. The amendment also introduced a special incentive which can be offered for plants brought into production not later than December 31, 1973 in the counties of Stormont, Glengarry and Prescott in eastern Ontario and in the southwestern portion of Quebec, areas not previously designated. In the Atlantic Provinces this special incentive is available in addition to the regular incentives.

The over-all program provides for incentive grants of up to \$30,000 per job or one half of the capital to be employed in the operation, whichever is less. The amount of incentive offered in an individual case is determined by assessing the various financial and economic implications of each project. Factors analyzed include the project's economic impact on the region concerned and the company's need for an incentive in order to create a viable operation in the designated region. Experience to date has shown that these incentives exert a strong influence on industry to undertake new activity in the designated areas. From the program's introduction in July 1969 to January 1, 1973, 1,957 applicants accepted offers of incentives totalling approximately \$324.4 million for projects involving an estimated total investment of \$1,616 million, and the creation of some 81,750 new jobs in various parts of the country when the new operations are brought into production.

Special area program. To make industrial incentives as effective as possible in overcoming regional disparities, slow-growth regions must have centres which will attract industry by ensuring that the necessary utilities and services, as well as a wide variety of social facilities to meet the needs of a growing population, are available. For this reason, one of the major purposes of the Department's special area program is to speed the development of such centres by helping provincial governments to build up essential municipal services.

Under the program authorized by the 1969 Government Organization Act, the federal government, in consultation with a province, can designate areas where special action is needed to promote economic expansion and social adjustment. Because development plans are designed, through federal-provincial co-operation, to meet specific needs, the type of federal action varies from area to area.

The first 22 special areas under the program were designated in March 1970 and federal-provincial agreements were signed covering specific infrastructure development projects in 18 of these areas. In the four other areas, the main federal assistance consists of incentives to industry. A 23rd special area, Ste-Scholastique, was designated in February 1971 and infrastructure projects for that area were included in an amended Special Areas Agreement with Quebec. The agreements commit the Department to provide various provinces with a total of up to \$440 million in grants and loans over the period to March 1975, depending on the designated period and funding arrangement for each special area. This is additional to any federal money that may be offered in industrial incentives. The agreements provide for the inclusion of other jointly identified projects or for the joint preparation of further development plans for areas not already designated. In addition, DREE will consult with the provinces regarding the possible future designation of further special areas.

The Cape Breton Development Corporation was established in 1967 to rationalize the coal industry of Cape Breton Island and broaden the economic base of the area by assisting the financing and development of industry to provide employment outside the coal mines. From its head office in Sydney it now operates three mines in the Sydney coalfield and is developing one new one. It is actively engaged in development of the tourist industry as well as primary products and various secondary industries. The Corporation offers a very flexible program and the amount of financial assistance it makes available is determined by the merits of each individual application. The Corporation reports to Parliament through the Minister of Regional Economic Expansion.

Other DREE programs. The Agricultural and Rural Development Act (ARDA) is a federal-provincial shared-cost program with provisions for rural development and adjustment programs. Five-year ARDA agreements, for the 1970-75 period, have been signed with all provinces except Prince Edward Island, which is covered by a comprehensive rural development plan. New special agreements emphasizing programs for disadvantaged Indian and Métis people have also been signed with Manitoba, Saskatchewan, Alberta and British Columbia.

The Fund for Rural Economic Development (FRED) was replaced by DREE's special area program, but five projects in operation at the time will continue to completion.

Since its creation in 1935 the Prairie Farm Rehabilitation Administration (PFRA) has concentrated on large irrigation and water-control projects, and on irrigation, stock-watering and domestic water supply projects at the farm level. It has also distributed, free of charge, up to 10 million seedlings a year for farm shelterbelts. As a continuing entity within DREE, PFRA has been given new responsibility in implementing departmental programs in Alberta, Saskatchewan and Manitoba.

The Newfoundland Resettlement Program is a federal-provincial shared-cost program established to help people in Newfoundland move from areas where economic prospects are poor to parts of the island that afford better employment opportunities and public services.

The Atlantic Development Council, with 11 members appointed by the federal government in consultation with the governments of the Atlantic Provinces and the Canada Council on Rural Development, composed of representatives of private organizations who are appointed by the Minister, both act as advisory bodies to the Minister of Regional Economic Expansion.

4.5.3 Provincial planning agencies

Nova Scotia's Voluntary Planning, an organization representing non-government elements of the Nova Scotia community, was established in 1963 with the general objective of involving the private sector, on a co-ordinated and balanced basis, in a continuing program of economic and social development.

The organization comprises the following main components: sector committees representing "grass root" elements of producers, private business, labour and government in agriculture, construction, fisheries, forestry, mining, tourism, transportation, and secondary manufacturing; advisory councils in consumer affairs, education, power development and labour-management affairs; the Provincial Planning Board, which is made up of the sector and council chairmen, together with other representatives of business, labour and government; and a small professional staff which provides administrative and technical support to the volunteer groups.

Voluntary Planning defines its role as follows:

"To provide for the effective involvement of the private sector in development planning. To facilitate the identification of problems by the private sector and to relate appropriate private and public resources in an attempt to resolve these problems. To involve the private sector in the analysis of government planning proposals during the process of their development, and prior to final approval."

Through this planning agency government has a single contact with all major elements of the private sector and the private sector has both a forum for discussing mutual problems and a channel with government for submitting co-ordinated views on any aspect of development planning.

Quebec Planning and Development Bureau. In 1969, the Quebec Planning Board, created the previous year, became the Quebec Planning and Development Bureau, a corporate body administered by a director-general, who is chairman, and five other members appointed by the Lieutenant-Governor in Council.

With the objective of making the best possible use of the province's human and natural resources, the Quebec Bureau plans research and programs for economic and social advancement and for area development. It acts as a liaison between other provincial departments and agencies involved in planning and development, gathers information about their policies and programs and co-ordinates research activities. The Bureau advises the government about development projects undertaken and makes recommendations based on its own research. In addition, it directs any projects the Lieutenant-Governor charges it with and administers funds available for its program.

Two organizations advise the Bureau: the Interdepartmental Planning and Development Council comprising all Deputy Ministers of the Quebec government, and the Quebec Planning and Development Committee which represents Quebec socio-economic organizations, major specialized councils, regional representatives and special members. These two agencies advise the Bureau on subjects referred to them for consultation; however, the Bureau must indicate to the Council how it proposes to carry out its duties as liaison office for the implementation of plans, programs or projects.

The Bureau is responsible for administering three main agreements: (1) the Canada - Quebec Co-operation Agreement for Development of the Lower St. Lawrence, Gaspé and Magdalen Islands, covering the period 1971-76, which began under the FRED program and replaced the 1968 Agreement on Eastern Quebec; additional funds made available when the Agreement was revised facilitated a shift in emphasis to development programs; (2) the Canada - Quebec Federal-Provincial Rural Agreement, 1971-75, which operates under the ARDA program, makes funds available to speed up implementation of an integrated resource-development program in the Saguenay - Lake St. John and northwestern Quebec areas; and (3) the Canada - Quebec Federal-Provincial Agreement Concerning the Development of Special Areas, which covers development in the Quebec City, Trois-Rivières and Sept Îles - Port Cartier regions as well as in the sub-region of the new Montreal International Airport near Ste-Scholastique.

The Ontario Economic Council, formed initially by Order in Council in 1962, was established by legislation in 1968. It was conceived as a provincial organization in which representatives of a broad cross-section of informed people could pool their knowledge and experience regarding social and economic questions, commission research and formulate policy

recommendations to the public and private sectors. At present, 18 (of a maximum 21) Ontario citizens serve on the Council, representing business, finance, labour, agriculture, universities and government. Each member serves without compensation for a term of one, two or three years. The Council meets monthly, generally in Toronto although meetings are held occasionally in other Ontario centres.

Essentially, the Council operates as an advisory body reporting some of its findings directly to the Ontario government and publishing others for wider distribution. Recent reports cover the fields of immigration, government reform, poverty, urban development, social change, municipal reform and municipal waste disposal. A biennial index of research projects carried on within provincial government agencies and departments and certain industrial companies operating in Ontario is also published.

The Council shares the Ontario government's view that the economy of the province is not an entity separate from Canada. For this reason the Council does not undertake separately for Ontario what the Economic Council of Canada has done and is doing for Canada as a whole. Projects are undertaken with the Economic Council of Canada on a co-operative basis and information is exchanged between the two Councils.

A small permanent Council staff undertakes direct assignments and supervises the design and administration of projects assigned to others. Areas of study are established as a result of liaison and discussion with the public and private sectors. Until recently the greater portion of the Council's research was carried on within Ontario universities. However, the professional services of private consulting firms are now being used more frequently.

4.6 External relations

4.6.1 Canada's international status

The growth of Canada's international status is reflected in the development of the Department of External Affairs. Until the 20th century Canadian negotiations with foreign countries were conducted through the British Foreign Office and dealings with other parts of the Empire through the Colonial Office; Canadian interests abroad were handled by British diplomatic and consular authorities and all Canadian communications to other governments went through the Governor General. The gradual recognition of Canadian autonomy in international affairs and increased Canadian responsibilities abroad made expansion of services and representation after 1920 not only inevitable but imperative. British diplomatic and consular authorities could no longer conveniently look after all Canadian interests. An important step in the evolution of the Department of External Affairs as the foreign service arm of the Canadian government resulted from an agreement reached at the 1926 Imperial Conference which changed the Governor General's role from that of representative of the British government to that of personal representative of the Sovereign. Britain, no longer officially represented here, appointed a High Commissioner to Canada in 1928; after July 1, 1927 correspondence from foreign governments, including that from the Dominions Office in London, was directed to the Secretary of State for External Affairs (a portfolio held by the Prime Minister until 1946) instead of to the Governor General.

In the 1920s and 1930s Canada established diplomatic relations with Australia, Belgium, France, Ireland, Japan, the Netherlands, New Zealand, South Africa and the United States and during the 1940s, with the wartime governments of Belgium, Czechoslovakia, Greece, the Netherlands, Norway, Poland, Yugoslavia functioning in London or Cairo, and with the Argentine Republic, Brazil, Chile, China, Cuba, Mexico, Newfoundland, Peru and the USSR. High Commissioners were accredited to India, Pakistan and Ceylon (Sri Lanka) and subsequently to other countries as they became independent and joined the Commonwealth. In the 1960s, Canada also developed its diplomatic relations in the French-speaking world, particularly with the newly independent francophone states of Africa. Relying on a system of multiple accreditation, Canada now has ambassadorial links with all of the 21 francophone African countries. Diplomatic relations were established with the Holy See in 1969 and with the People's Republic of China in 1970. Today, Canada maintains formal diplomatic relations with all 20 countries in Latin America and has diplomatic, consular or trade representation in 127 countries.

Membership in international organizations has entailed establishment of other offices outside Canada. A Permanent Canadian Delegation to the United Nations in New York was

set up in 1948; a year later a Canadian office was opened at the organization's European headquarters in Geneva. Now called Permanent Missions, these offices have since been expanded. As one of the founding members of the North Atlantic Treaty Organization (NATO) in 1949 Canada remains active in the Organization. When the NATO Permanent Council was established in 1952 a Canadian Permanent Delegation was set up in Paris (transferred to Brussels in 1967). A Canadian Permanent Delegation to the Organization for Economic Co-operation and Development is in Paris. In addition to these permanent international bodies and their various committees, officials of the Department of External Affairs represent Canada at many international conferences.

4.6.1.1 Diplomatic and/or consular representation

Canadian representation abroad. Names of current representatives are given in *Canadian representatives abroad* published once a year and available from Information Canada, Ottawa.

Representation of other countries in Canada. Names of current representatives are given in *Diplomatic corps and consular and other representatives in Canada*, published three times a year (February, June, October) and available from Information Canada, Ottawa.

4.6.1.2 Federal-provincial aspects of Canada's international relations

As a result of expanding provincial interests abroad machinery was established in 1967 within the Department of External Affairs to maintain close liaison with the provinces and to facilitate their international activities in a manner that would fully meet provincial objectives and at the same time be consistent with a unified Canadian foreign policy.

The federal government's position was outlined in the 1968 White Paper *Federalism and international relations*, which emphasized that Canada's foreign relations must serve the best interests of all provinces as well as those of its two major linguistic communities. To this end federal government policies include continued promotion of national unity through an adequate projection internationally of Canada's distinct bilingual character, preservation of Canada's international personality and appropriate recognition of legitimate provincial interests beyond national borders.

Provincial participation at international conferences and in the work of international organizations on a wide range of subjects, including human and civil rights, education, health, agriculture and labour, is assured by the inclusion of interested provincial officials on Canadian delegations and by the canvassing of provincial governments for their views on the positions and attitudes which Canada might adopt on these subjects internationally.

Other aspects of Canada's international relations of particular interest to the provinces include the promotion of trade, investment, new industries, immigration, tourism, cultural exchanges, environmental questions, science and technology, assistance to developing countries and bilateral and multilateral agreements. The promotional activities of the provinces have led to an increase in the number of official provincial visits abroad. The federal government, through the Department of External Affairs and its Embassies and High Commissions, assists provincial officials by making arrangements and appropriate appointments for their visits abroad and in co-ordinating visits of foreign personalities to provincial capitals.

In matters of aid to developing countries, the federal government encourages wider federal-provincial consultation to ensure that specific projects initiated by the provinces are co-ordinated with Canada's aid contribution as a whole.

Similarly, when the terms of treaties, conventions and other formal agreements between Canada and other countries touch on provincial or joint federal-provincial fields of jurisdiction, the federal government consults with the provinces before or during the negotiating stage to harmonize federal and provincial interests.

4.6.2 International activities

4.6.2.1 Canada and the Commonwealth

Over the years the Commonwealth has evolved significantly in composition and outlook. Its present membership of 31 sovereign states covers about one quarter of the earth's land surface, represents approximately 850 million people of many races, colours, creeds and languages, and includes both economically developed and developing countries as well as governments committed and uncommitted in the international power groupings. The interests

of its members extend to all continents and the variety of issues demanding attention increased greatly during the 1960s and will undoubtedly continue through the 1970s.

Commonwealth members listed according to the year (if post-1931, noted in parentheses) when membership was proclaimed are as follows: Britain; Canada; Australia; New Zealand; India (1947); Sri Lanka (1948); Ghana (1957); Nigeria (1960); Cyprus (1961); Sierra Leone (1961); Jamaica (1962); Trinidad and Tobago (1962); Uganda (1962); Kenya (1963); Malaysia (1963) – when Singapore, Sarawak and Sabah joined the Federation in 1963, Malaya became Malaysia; Malawi (1964); Malta (1964); Tanzania (1964) – in 1964 Tanganyika and Zanzibar joined to form the United Republic of Tanzania; Zambia (1964); Gambia (1965); Singapore (1965) – Singapore separated from Malaysia in 1965; Guyana (1966); Botswana (1966); Lesotho (1966); Barbados (1966); Mauritius (1968); Swaziland (1968); Tonga (1970); Western Samoa (1970); Fiji (1970); and Bangladesh (1972). The Commonwealth of the Bahama Islands will become a full member of the Commonwealth after attaining its independence on July 10, 1973. Nauru, which became fully independent in 1968, has “special” membership in the Commonwealth which entitles it to all the advantages of membership except attendance at Heads of Government Conferences. Through their association with Britain, which has retained responsibility for foreign affairs and defence, the six West Indies Associated States (Antigua, Dominica, Grenada, St. Kitts - Nevis - Anguilla, St. Lucia and St. Vincent) also have an appropriate relationship with the Commonwealth.

Continuing membership in the Commonwealth has been an important aspect of Canada's foreign policy. It has supported the extension and development of a vigorous and effective Commonwealth capable of exerting a beneficial influence for international peace and progress. Commonwealth ties give Canada a special relationship with this group of nations which, despite the diversity of their backgrounds, share important common ideals and traditions, characterized by a spirit of co-operation developed through consultation and a continuous exchange of views.

The Commonwealth Secretariat was established by a 1965 decision of heads of government and is located in Marlborough House in London. The Secretariat organizes and services official Commonwealth conferences; it facilitates the exchange of information between all member countries and serves as a visible symbol of the co-operative spirit of the Commonwealth. Canada's contribution to the 1971-72 budget of the Secretariat was \$275,699 or 17.9% of the total.

The most important initiative of the Secretariat is the organization of conferences of the Commonwealth Heads of Government; the latest was held in Singapore in January 1971. The next will be hosted by Canada in Ottawa in August 1973. Other Commonwealth conferences held in 1971-72 included the Fifth Commonwealth Education Conference in Canberra, the Third Quinquennial Conference of the Commonwealth Council of the Royal Life Saving Society in London, the annual Commonwealth Finance Ministers Meetings in Nassau and London, the Meeting of Commonwealth Officials on Consular Relations within the Commonwealth in London, and the Meeting of Commonwealth Senior Officials on Techniques of Government and the Commonwealth Telecommunications Conference, both in Ottawa.

4.6.2.2 The French community

Canada is a bilingual country with more than 6 million French-speaking inhabitants. To make the most of this special characteristic internationally, Canada has established close links with other francophone countries. Its bilateral relations with France have developed greatly in recent years through political consultations, parliamentary visits, cultural and scientific exchanges, increased trade, exchanges of government officials and defence production co-operation. To its relations with French-speaking European countries has been added considerable bilateral aid to the French-speaking Third World. A growing proportion of Canadian economic aid has been directed to francophone countries in Africa; in 1972-73 the Canadian International Development Agency allocated more than \$68 million, or 21% of Canada's bilateral aid budget, to this group.

Recognizing the value of ties with an international community of some 30 countries with 150 million inhabitants, Canada has played an active role in developing multilateral co-operation among French-speaking countries. It is a founding member of the *Agence de coopération culturelle et technique* and in 1972 was the host for the first annual meeting of the

Agency's General Conference. This conference formally noted the conditions agreed on by the federal and Quebec governments by which the latter was admitted to the institutions, activities and programs of the agency as a participant. The event confirmed Quebec's special interest in co-operation among French-speaking countries. Since that time the governments of New Brunswick, Ontario and Manitoba have become involved in the Agency's activities. Canada is also a member of the Conference of Education Ministers of the Francophone States of Africa and Madagascar as well as being a founding member of the Conference of the Youth and Sports Ministers of Francophone Africa and Madagascar; the fifth Conference will be held in Canada in 1974. In 1971 Canada took part in the Conference of Ministers of the Civil Service of French-speaking countries. Canadian participation is based on full federal co-operation with the provinces interested in these organizations.

4.6.2.3 Canada and the United Nations

Firm support for the United Nations is an essential element of Canadian foreign policy. Over the years Canada has contributed to UN peacekeeping efforts in various parts of the world, including the Middle East, Kashmir, the Congo, West Irian and Cyprus. At present, this country maintains a large contingent in Cyprus (UNFICYP) to assist the UN in preventing open fighting between the Greek and Turkish communities. Canada has consistently advocated strengthening the UN's peacekeeping capacity by advance planning at UN headquarters and advance cost-sharing arrangements. Despite slow progress and occasional setbacks, Canada continues to believe that the UN has an important role to play in the maintenance of international peace and security.

Canada also participates directly in the work of the UN through its membership in various UN bodies including the 13 specialized agencies and the International Atomic Energy Agency. The International Civil Aviation Organization in Montreal is the only specialized agency of the UN with headquarters in Canada.

Canada belongs to 18 subsidiary or ad hoc bodies of the General Assembly, including the Committee on the Peaceful Uses of Outer Space, the Disarmament Commission, the Special Committee on Peacekeeping Operations, the United Nations Scientific Committee on the Effects of Atomic Radiation, the Board of Auditors, the United Nations Scientific Advisory Committee, the Conference of the Committee on Disarmament, and the Committee on the Peaceful Uses of the Sea-Bed and Ocean Floor Beyond the Limits of National Jurisdiction. Canada maintains Permanent Missions to the UN in New York and in Geneva.

Canada pays 3.08% of the organization's regular budget and is the eighth largest contributor. In the UN financial year 1972, Canada's share of the net expenditures of about \$209 million was approximately \$5.5 million. The cost to Canada of maintaining its contingent in Cyprus was about \$1.6 million in 1971-72. In addition, Canada makes voluntary contributions to special UN programs such as the United Nations Development Programme (UNDP), the United Nations High Commissioner for Refugees (UNHCR), the United Nations Children's Fund (UNICEF), the United Nations Relief and Works Agency in the Middle East (UNRWA) and the World Food Programme (WFP).

Membership of the Economic and Social Council was increased in December 1971 from 27 to 54 by amendment to article 61 of the UN Charter, to take effect when two thirds of the membership of the UN, including the five permanent members of the Security Council, have ratified the amendment. Meanwhile, Canada, although not a member of the Council, does hold membership on many of its most important sub-bodies, including the Economic Commission for Latin America, the Commission on Narcotic Drugs, the Commission for Social Development, the Commission on the Status of Women, the Advisory Committee on the Application of Science and Technology to Development, the Committee on Science and Technology for Development, the Committee on the Elimination of Racial Discrimination, the Committee on Review and Appraisal of the Second Development Decade and the Committee on Natural Resources.

Canada serves on the Governing Council of the UN Development Programme and on the Executive Board of UNICEF, is a member of the Trade and Development Board of the UN Conference on Trade and Development (UNCTAD) as well as a member of all UNCTAD's main Committees — Commodities, Manufacturing, Shipping, and Invisibles and Financing relating to Trade — and is a member of the Executive Committee of the Office of the United Nations High Commissioner for Refugees. Canada played a leading role in the 1972 United

Nations Conference on the Human Environment in Stockholm and co-sponsored resolutions at the 27th General Assembly of the UN which resulted in the establishment of the 58-member Governing Council for Environmental Programmes, a voluntary Fund for the Environment and the Environment Secretariat. Canada was elected to the Governing Council, and pledged between \$5 million and \$7.5 million to the Fund over a period of five years.

Canada's total assessment and contributions to the UN, its specialized agencies and related bodies totalled approximately \$500 million during the period 1945-72 and about \$61 million in 1971-72. A breakdown of Canadian contributions to UN agencies in 1971-72 is shown in Table 4.7. The Canadian subscription to the World Bank (the International Bank for Reconstruction and Development) now totals the equivalent of \$1,022.5 million in current US dollars for 3.7% of the total. The International Development Association, an affiliate of the World Bank, has received from Canada interest-free contributions or pledges amounting to the equivalent of \$276 million in current US dollars since it was first established. The International Finance Corporation, also a member of the World Bank Group, has a total paid-in capital of about US\$107 million, of which the Canadian subscription amounts to US\$3.6 million.

Specialized agencies. Canada is a member of each of the 13 specialized agencies of the UN, as well as of the autonomous International Atomic Energy Agency (IAEA). Invested with wide international responsibilities established by intergovernmental agreement, these agencies assist in carrying out the terms of the UN Charter. The Administrative Committee on Co-ordination, established by the Economic and Social Council and composed of the Secretary General of the UN, executive heads of the specialized agencies, the director-general of the IAEA and other senior officials of the UN, considers common administrative questions, inter-agency program co-ordination and projects or problems of special urgency to be undertaken jointly by several agencies.

The International Labour Organization (ILO) was originally established with the League of Nations in 1919 and became a specialized agency of the UN in 1946. It brings together representatives of governments, employers and workers from 124 (1972) member states in an attempt to promote social justice by improving living and working conditions in all parts of the world. The ILO is responsible for a number of technical and training programs financed by the United Nations Development Programme, as well as training programs under its regular budget. It meets frequently during the year and holds a conference in Geneva each June. Canada has been a member of the ILO from its inception and as one of the leading industrial states, it has been assigned one of the ten seats on the Governing Body.

The Food and Agriculture Organization (FAO), established in 1945, is one of the largest of the specialized agencies, now having 125 members. Raising the nutrition levels and living standards of its member countries and improving production and distribution techniques for food and agricultural, fishery and forestry products are two of its objectives. To this end, the FAO Secretariat provides advisory services, collects and publishes agricultural and fisheries statistics, and organizes international conferences and meetings of experts concerned with agricultural, forestry and fisheries problems.

The FAO Council meets twice a year to give direction and policy guidance to the Secretariat; the FAO Conference meets every second year. Its 16th meeting was held in November 1971 at Rome. FAO headquarters is in Rome and regional offices are located in Washington, Bangkok, Rio de Janeiro, Santiago and Cairo. Canada participates actively in FAO functions and is a member of the Council, the Finance Committee, the Committee on Commodity Problems, the Committee on Fisheries, the Consultative Sub-committee on Surplus Disposals, the FAO Group on Grains, the North American Forestry Commission and other FAO bodies.

The Joint FAO-WHO Food Standards Programme, controlled by the Codex Alimentarius Commission, was established in November 1961 by a resolution of the FAO Conference. Its statutes were adopted by the 16th World Health Assembly. The Programme is administered by an executive committee of which Canada is a member.

The World Food Programme first began operations on a three-year experimental basis at the beginning of 1963 under the joint auspices of the FAO and the UN. At the end of 1965, it was established on a continuing basis for as long as multilateral aid is forthcoming. It attempts

to provide food aid on a multilateral basis for emergency relief and to promote economic and social development, including the feeding of children. In January 1970, \$215.6 million was pledged toward the 1971-72 program; Canada, with a pledge of \$30 million, is the second largest supporter of the Programme. In 1971, the Intergovernmental Committee of the WFP approved a target of \$340 million for 1972-73.

The World Health Organization (WHO), created in 1948, now has 133 members and two associate members. Functioning through the World Health Assembly, the Executive Board, the Secretariat and six regional committees, WHO acts as a directing and co-ordinating authority on international health matters. The objective of the Organization, as set out in its constitution, is "the attainment by all peoples of the highest possible level of health". To pursue this goal, WHO provides advisory and technical services from its Geneva headquarters to help countries develop and improve their national health services. The 25th World Health Assembly was held in Geneva in May 1972.

The United Nations Educational, Scientific and Cultural Organization (UNESCO) was established in 1946 "to contribute to peace and security by promoting collaboration among the nations through education, science and culture in order to further universal respect for justice, for the rule of law, for human rights and fundamental freedoms". Its headquarters is in Paris and total membership is 130 states.

The Organization is made up of three principal organs – the General Conference which is the policy-making body, the Executive Board and the Secretariat. Representatives from member states make up the General Conference which meets every two years to consider applications for membership, to elect the Executive Board and to plan the program and approve the budget for the ensuing two-year period. The 17th Session of the General Conference, held in Paris in 1972, approved a budget of approximately US\$119 million for 1972-73, giving priority to the educational needs of the developing countries and to science activities, particularly the application of science to development; the Canadian assessment rate is 2.91%.

The International Civil Aviation Organization (ICAO), with headquarters in Montreal, was established in 1947 to promote the safe, orderly and economic development of international civil aviation. It has a membership of 124 (1972). ICAO operations are conducted through its Assembly, Council, committees and Secretariat. Canada has been a member of the 27-nation Council, the governing body of ICAO, since its inception. The 18th triennial Assembly was held in Vienna in 1972.

The International Telecommunication Union (ITU), founded to oversee application of the International Telegraph Convention of 1865 and the International Radio Telegraph Convention of 1906, is concerned with international co-operation for the improvement and use of telecommunications for the benefit of the general public; it has 142 member countries. The Union's 1965 Plenipotentiary Conference adopted the International Telecommunication Convention. The 1973 Plenipotentiary Conference will be held in Torremolinos, Spain. Canada is represented on the 29-member Administrative Council, the executive organ of the ITU.

The World Meteorological Organization (WMO), a specialized agency of the UN since 1951, has evolved from the International Meteorological Organization founded in 1878; in 1972 WMO had 136 members. One of its major programs is the "World Weather Watch" for developing an improved world-wide meteorological system and environment. Canada is a member of the Executive Committee of the Organization. The 17th quadrennial World Meteorological Congress will be held in 1975.

The Inter-Governmental Maritime Consultative Organization (IMCO) was established in 1959 to promote international co-operation on technical shipping problems and the adoption of the highest standards of safety and navigation; its membership in 1972 was 73. IMCO exercises bureau functions for International Conventions on Safety of Life at Sea, Prevention of Pollution of the Sea by Oil and Facilitation of International Maritime Traffic. At the seventh Assembly in 1971, Canada was elected to the Council of IMCO for a two-year term and continues to hold a seat on the Maritime Safety Committee.

The Universal Postal Union (UPU) is one of the oldest and largest of the specialized agencies, having been founded in Berne in 1874 with the principal aim of improving postal services

throughout the world and promoting international collaboration; it had 146 members in 1972. The Universal Postal Congress meets every five years to review the Universal Postal Convention and its subsidiary instruments. In the interim, UPU activities are carried on by an executive council, a consultative committee on postal studies and an international bureau. The 16th Congress was held in Tokyo in 1969.

The International Monetary Fund (IMF), created by the Bretton Woods Conference in 1944, was established in 1945. It provides machinery for international consultation and collaboration on monetary, payment and exchange problems, including promotion of exchange stability, elimination of exchange restrictions, establishment of a multilateral system of current payments and expansion and balanced growth of international trade. Member countries under certain conditions may draw on the regular resources of the Fund, which now amount to some 30,000 million units in Special Drawing Rights, of which the equivalent of about 5,300 million SDRs is in gold. Members can also draw on the supplementary resources of US\$6,000 million made available in 1962 under the General Arrangements to Borrow, which have since been extended to October 1975. Canada's present subscription and quota in the IMF is 1,100 million SDRs of which 25% was paid in gold and the remainder in Canadian currency.

On January 1, 1971 a further allocation of SDRs was made to the 110 member countries participating in the Special Drawing Account. The 2,949 million unit allocation of this fiduciary reserve asset represented the second instalment of a total of 9,500 million SDRs to be created during the first three-year base period ending December 31, 1972. This allocation resulted in a 3.6% increase in the official world reserves.

Special Drawing Rights have now become established as usable and acceptable reserve assets in Fund transactions. Total transactions in SDRs in 1971 amounted to 831 million units with the General Account of the IMF acquiring about 198 million SDRs and the Special Drawing Account participants the remainder. Among the latter, Canada accounted for over 72 million units raising its total holdings to a level of 54% in excess of the cumulative amount of 242 million units allocated to it since January 1, 1970.

The Fund now has 120 members and Canada has been represented on the Fund's Executive Board since its inception.

The World Bank Group, consisting of the International Bank for Reconstruction and Development (IBRD) or World Bank, the International Finance Corporation and the International Development Association, is by far the largest of the multilateral aid-giving institutions.

The International Bank for Reconstruction and Development (World Bank), like the International Monetary Fund, originated in the Bretton Woods Conference of 1944. Its early loans were made to assist in the postwar reconstruction of Europe but it has played an increasingly important role in providing financial assistance and economic advice to the less-developed countries. It has become the world's largest multilateral source of development finance. By December 31, 1972, the Bank had made loans totalling US\$18,300 million to 90 of its 122 member countries in Central and South America, Asia, Africa and Southern Europe.

The resources available to the Bank for use in its lending operations are: that portion of its subscribed capital which is paid in by governments and freely usable (US\$2,700 million); its retained income from operations (US\$1,800 million); and the funds it is able to raise by the sale of bonds to central banks and government agencies and on private capital markets. By selling bonds and loans from its portfolio to other investors, the World Bank augments its capital. As at December 31, 1972, the Bank had outstanding borrowings of US\$7,400 million in various currencies. The World Bank's policy is to keep its lending rates as low as possible while maintaining its ability to borrow. The current lending rate is 7¼%; maturity periods on loans are usually from 15 to 30 years. In 1972, the Bank's lending level was of the order of US\$2,200 million.

Most World Bank loans are made to finance so-called infrastructure projects (roads, rails, ports, and electricity generation and transmission) which provide the framework basic to a country's economy but which generally do not attract private investors. Increasingly, however, the Bank has been giving more emphasis to other sectors such as agriculture, telecommunications, education, water supply and sewage.

Canada's subscription to the World Bank is the equivalent of \$1,022.5 million in current US dollars out of a total for all countries of US\$29,300 million. Only 10% of each subscription is paid in, however, with the balance remaining as a guarantee against which the Bank is able to sell its own bonds in world capital markets. Thus Canada's paid-in subscription is US\$102.2 million. This includes the US\$16.3 million paid-in portion which Canada subscribed to in May 1972 as part of the selective increases approved in 1970. In all, the Bank has offered nine bond issues totalling \$211 million in the Canadian market. Maturities on these bonds ranged from one to 25 years and the interest rate from 3½% to 7%.

The International Finance Corporation (IFC) was established in 1956 as an affiliate of the IBRD to assist less-developed member countries to promote the growth of the private sector of their economies. IFC's principal aims are to provide risk capital for productive private enterprises in association with private investors and management; to encourage the development of local capital markets; and to stimulate the international flow of private capital. IFC makes investments in the form of share subscriptions and long-term loans, carries out standby and underwriting arrangements and provides financial and technical assistance to privately controlled development finance companies. Of IFC's total subscribed capital of US\$107 million, Canada provided US\$3.6 million. In addition to its subscribed capital, IFC is able to finance its activities through loans from its parent institution, the World Bank. Total investments and underwriting commitments by IFC to December 31, 1972 amounted to US\$733.7 million. Commitments made during 1972 were US\$130 million.

The International Development Association (IDA), an affiliate of the IBRD, was established in 1960 to provide external resources on highly concessional terms for developing countries which could not pay conventional rates of interest on development loans. The IDA is the "soft loan window" of the World Bank Group. IDA loans are made to member governments for 50 years, at no interest, with a ten-year grace period and a service charge of less than 1%. IDA and IBRD operate with the same staff and the same standards, and projects selected must satisfy the same economic criteria regardless of whether they are financed with money on hard or soft terms or a mixture of the two. A country's economic prospects and its ability to service its foreign debt determine the type of loan it may secure.

Because of the nature of its operations, IDA obtains its resources from developed member countries in the form of interest-free subscriptions and contributions and, to a smaller extent, from a portion of World Bank profits. As at December 31, 1972, resources available to the Association totalled approximately US\$4,000 million, of which Canada contributed US\$276 million. This includes Canada's first two annual instalments of US\$54 million each, paid in November 1971 and 1972, toward IDA's Third Replenishment. Under the Third Replenishment, 21 member countries together with Switzerland agreed to make available to IDA a total of over US\$2,600 million between 1972 and 1974. By December 31, 1972, credits extended by the Association to 62 of its 111 member countries totalled about US\$4,200 million.

The International Atomic Energy Agency (IAEA) was created in 1957 as an autonomous international organization under the aegis of the UN which has empowered it to try to accelerate and enlarge the contribution of atomic energy to peace, health and prosperity throughout the world. As at August 1972, membership consisted of 103 states. Because Canada has been designated as one of the members most advanced in nuclear technology, including the production of source materials, a Canadian representative has served on the Board of Governors since the Agency's inception. Canada is the only non-nuclear weapons state to occupy a permanent seat on the Board.

Conferences and symposia, dissemination of information and provision of technical assistance are among the methods adopted to carry out the functions of the Agency. With the rapid expansion in the use of nuclear power, much activity is devoted to this field as well as to the use of isotopes in agriculture and medicine. Another significant role relates to the development and application of safeguards to ensure that nuclear materials supplied for peaceful purposes are not diverted to military uses. Under terms of the Treaty for the Non-Proliferation of Nuclear Weapons, each non-nuclear weapons state adhering to the Treaty was to conclude an agreement with the IAEA before March 5, 1972, providing for safeguards on its entire nuclear program. Agency inspectors carried out safeguards inspections in Canada and in more than 60 other countries in 1972.

4.6.2.4 Canada and the Conference of the Committee on Disarmament

The Canadian government has long placed importance on international efforts to work for a safer world through arms control and disarmament. Canada is an active member of the UN Conference of the Committee on Disarmament (CCD), a 26-nation negotiating body. This Committee, of which the United States and the Soviet Union are co-chairmen, represents in microcosm the world-wide concern to stop the arms race. The CCD is currently seeking a comprehensive prohibition of nuclear weapons testing including underground tests, and a ban on the research, development, production and stockpiling of chemical weapons.

4.6.2.5 Canada and the North Atlantic Treaty Organization

1972 was a particularly active year for the NATO Alliance in its continuing search for both military stability and political détente in Europe. As one of the founding members of the Alliance, Canada continued to play a prominent role in all its activities.

The encouraging results of the Federal Republic of Germany's *Ostpolitik* and the agreements reached between the United States and the Soviet Union on strategic arms limitation in large measure made it possible for the progress toward political détente evidenced by the initiation of two sets of East-West talks in 1972: multilateral preparatory talks for a Conference on Security and Co-operation in Europe and exploratory talks on possible future Mutual and Balanced Force Reductions in Central Europe. Full-scale international conferences on these subjects are expected to be convened during 1973. Throughout the preparation for these talks the North Atlantic Council and its committees continue to play a key role in developing and co-ordinating the views of individual NATO countries with respect to the principal problems under negotiation.

As part of its contribution to the collective defence of the Alliance, Canada continued to station land and air elements numbering some 5,000 men in the Federal Republic of Germany. In addition, Canadian naval units in the North Atlantic continued to be earmarked for assignment to the NATO Supreme Commander Atlantic in the event of an emergency. Canada also co-operates with the United States in the defence of the North American part of the Alliance. The North American Air Defence Command (NORAD) is an integrated command system combining air defence units from both countries. The Agreement setting up the Command has been extended for a further two-year period commencing May 12, 1973.

As a forum for Allied consultation, NATO is involved in other activities of a non-military nature. One major development has been the work of the NATO Committee on the Challenges of Modern Society which is concerned with exchanges of views and experiences of individual NATO countries regarding ecological and environmental problems. Canada has not only participated actively in this Committee, but is one of the leaders in projects dealing with pollution of inland and coastal waters.

4.6.2.6 Canada and the United States

Relations with the United States are of vital importance to Canada and constitute what is in many respects a unique phenomenon in international relations. Geography has made the two countries neighbours and community of interest has made them friends, while the demographic realities and economic patterns of today present Canada with the challenge of living distinct from but in harmony with the world's most powerful nation. The two countries are one another's best customer: Canada sells to the United States just less than three quarters of all exports and buys almost one quarter of all US exports in an exchange of goods that now totals close to \$23,000 million per year.

Co-operation in bilateral and multilateral affairs continues to demonstrate the shared interests of both countries. Both are active members of the UN and its many specialized agencies and both participate actively in NATO, the General Agreement on Tariffs and Trade (GATT), the Organization for Economic Co-operation and Development and other important international organizations. Many bilateral bodies also facilitate Canada - United States co-operation: the Ministerial Committee on Trade and Economic Affairs brings together members of the Cabinets of both countries for discussions on a wide range of problems of bilateral as well as international interest, while the Permanent Joint Board of Defence serves as an advisory body on North American defence; the International Joint Commission, which has dealt with the regulation of flows of boundary waters and the abatement of trans-boundary air and water pollution, is also responsible for administering the Great Lakes Water Quality Agreement; many joint committees and agencies deal with other specialized subjects.

4.6.2.7 Canada and the Commonwealth Caribbean

The current phase of Canadian relations with the Commonwealth Caribbean dates from the Commonwealth Caribbean - Canada Conference of 1966, which established the broad guidelines for developing relations between the two areas. Considerable progress has been made in implementing the recommendations agreed to at that Conference. As part of the continuing process of consultation, a special Canadian Mission to the Commonwealth Caribbean in the fall of 1970 visited 13 countries and territories to discuss specific matters of common interest.

In 1971, Canadian investment in the region was estimated at between \$450 and \$550 million. In the preceding five years more than \$100 million was allocated to the Commonwealth Caribbean under Canadian development assistance programs. More than 3,000 Canadians live as permanent residents in the region and about 175,000 visit the islands annually. During 1971, more than 12,000 West Indians immigrated to Canada. There are Canadian High Commissions in Jamaica, Trinidad and Tobago, and Guyana, and these three countries, as well as Barbados, maintain High Commissions in Ottawa. There is also a Commissioner for the Eastern Caribbean in Montreal who represents the six West Indies Associated States (Antigua, Dominica, Grenada, St. Kitts - Nevis - Anguilla, St. Lucia and St. Vincent) and Montserrat.

4.6.2.8 Canada and Latin America

Canada maintains diplomatic relations with all Latin American republics through 14 resident diplomatic or consular missions. As envisaged in the foreign policy paper on Latin America published in 1970, substantial progress has been made in developing and intensifying relations with these countries and with inter-American institutions.

In 1972, Canada became one of the first nations to be accredited as a Permanent Observer of the Organization of American States (OAS); a Canadian Permanent Observer Mission was opened in Washington under an Ambassador accredited to the OAS. Canada, which has been a member of five inter-American organizations linked with the OAS — the Pan American Institute of Geography and History, the Inter American Statistical Institute, the Inter-American Centre for Tax Administrators, the Centre for Latin American Monetary Studies and the Postal Union of the Americas and Spain — has joined three more of these institutions: the Pan American Health Organization, the Inter-American Institute of Agricultural Sciences and the Inter-American Development Bank.

The most significant Canadian commitment to the development of this region was Canada's accession to full membership in the Inter-American Development Bank in 1972. Canada has subscribed US\$242 million to the Bank's ordinary capital fund, \$40 million of it paid in and \$202 million callable. Canada is also contributing US\$60 million to the Bank's Fund for Special Operations, making a total cash contribution of US\$100 million payable over an initial period of three years. Prior to Canadian membership, the Bank had administered Canadian loans totalling \$74 million for Latin American development over a period of eight years.

Bilateral relations were also intensified with countries in the area. For example, the Canadian program of bilateral development assistance to Latin American countries, expected to amount to \$10 to \$12 million annually, progressed from the planning to the implementation stage. Those countries which most need and can most effectively utilize Canadian technical assistance are receiving a major part of available resources through sustained programs. Other countries in the region are eligible to receive assistance on an ad hoc project-by-project basis; in 1972 both Cuba and Haiti were included in this group. In order to concentrate Canadian assistance within those sectors where Canadian technical expertise is most applicable to the region's needs, emphasis has been given to projects in the fields of education, agriculture, fisheries, forestry and public administration. Aid funds are also available through Canadian non-governmental organizations engaged in developmental and humanitarian work in Latin America, and through disaster-relief organizations.

Bilateral relations with Latin American countries have broadened in a number of ways. The series of youth, cultural, scientific and technical exchanges projected at the Canada - Mexico Ministerial Committee in October 1971 has begun. New initiatives in disseminating information about Canada include the opening of a Canadian Library Centre in Mexico City. Closer consultation and liaison with Latin American countries have been cultivated on a

widening range of questions of mutual interest such as the law of the sea, environmental improvement, narcotics control, anti-hijacking measures, emergency relief and disarmament.

4.6.2.9 Canada and Europe, the Middle East, Africa, and the Far East

Canada and Europe. Canada's relations with Western Europe have developed steadily under the impulse of major Canadian interests in the area. These countries have long been major trading partners for Canada and as a result of its growing prosperity and unity, Western Europe is likely to assume even greater importance for this country. Canada maintains close bilateral relations with Britain and France in particular, as well as with most other Western European countries, and has resident diplomatic missions in almost all of them. Canada is also, along with a number of Western European countries, an active member of NATO, OECD and wider international associations such as GATT. In view of the increasing economic and political importance that the Common Market is assuming for Canada, the Canadian government has been discussing with European Economic Community (EEC) member countries means of strengthening its economic relations through co-operation with the EEC in the field of industrial development.

Canada has a substantial interest in developing better relations with Eastern Europe. Increased trade, scientific and technological co-operation and cultural exchanges, and a strengthening détente in Europe have all been factors in this new situation. An important step toward détente was taken in November 1972 with the opening of talks in Helsinki preparatory to a Conference on Security and Co-operation in Europe.

A new era in Canadian - Soviet relations, based on a more candid and friendly atmosphere and on the principle of mutual benefit, was opened in 1971 with the signing of the Protocol on Consultations, the Industrial Exchanges Agreement and the General Exchanges Agreement, and expanded further in 1972-73 when they were implemented. These provide for regular and long-term co-operation between Canada and the USSR. At the same time, Canada has been pursuing improved relations with other East European countries in the hope of arranging similar mutually advantageous agreements. At present, Canada has resident diplomatic missions in Moscow, Prague, Warsaw, Belgrade and Budapest and maintains diplomatic relations with Romania and Bulgaria through non-resident Ambassadors.

Canada and the Middle East. Bilaterally, Canada enjoys cordial and increasingly important relations with most countries in the Middle East. For the past quarter-century, however, the area has been a focus of tension and conflict. During this period, Canada has participated in United Nations efforts to bring about an equitable and lasting settlement of the dispute between Arabs and Israelis and has made substantial contributions to measures designed to alleviate want among the victims of recurring hostilities.

Canada provided observers to the United Nations Truce Supervision Organization (UNTSO) and was closely associated with the formation of the United Nations Emergency Force (UNEF). Canadian troops served with UNEF in Gaza and Sinai from its creation until its withdrawal in May 1967. Canadian officers are still serving with UNTSO, set up to supervise the Arab-Israeli cease-fire in 1967.

Since the United Nations Relief and Works Agency for Palestinian refugees was established, Canada has contributed cash, food and other supplies to it. In emergency situations various forms of assistance have also been provided through the International Red Cross.

Canada and Africa. Direct relations were first established with former British colonies in Africa as they became independent members of the Commonwealth. Increasing contacts and diplomatic relations with the newly independent French-speaking African states soon followed as a result of the increasing emphasis which the Canadian government placed on French culture in this country as well as the important role played by francophone African countries in their continental affairs. Canada now maintains diplomatic relations with almost all the independent African states and through resident Canadian missions in 14 countries. The development of bilateral diplomatic and commercial relations has been accompanied by a significant and growing program of Canadian aid to Africa. More than \$107 million in aid funds was directed to the African continent in 1971-72 and a further \$129 million has been committed for 1972-73.

Canada and the Far East. For many years Canada has had important links, both official and private, with a number of states in Asia. These contacts were once restricted to a small group of Canadians and were limited in scope but during the past decade Canadians have become increasingly aware of their position as a Pacific as well as an Atlantic nation. At present Canada maintains diplomatic relations with 20 countries in Asia and has resident diplomatic missions in 13 countries.

Although some links had developed as a result of historic and traditional ties, as in the case of Australia and New Zealand, many of the new contacts were originally economic in character, resulting from increased trade and the provision of development assistance. The importance of Asia as a trading area is evident from Japan's emergence as Canada's third largest trading partner. Canada's Trade Fair in Peking in August 1972 and its participation in the Third Asian Trade Fair in New Delhi in October-November 1972 lend emphasis to this country's recognition of Asia's potential.

Relations with the countries of the Pacific Rim are increasing in importance as both the Pacific section of the government's 1970 foreign policy review and the growing number of meetings between Canadian Ministers and officials and their counterparts in other countries indicate. The long-term objectives of co-operation and development are fundamental to the future growth and stability of the region. Participation in the Colombo Plan, membership in the Asian Development Bank and Canada's official observer status with the Economic Commission for Asia and the Far East reflect this country's interest in having those aims achieved. A significant proportion of Canada's total assistance has been allotted to the developing countries of Asia and the government has expressed its readiness to contribute to the postwar economic rehabilitation of Viet-Nam and of the other countries of Indo-China. Canada has participated in various United Nations efforts to restore peace in Asia including UN operations in South Asia and in Korea. As a member of the original International Commission for Supervision and Control in Indo-China, Canada still maintains delegations in Viet-Nam and Laos and this aspect of its involvement in Asia has been further reinforced by participation in the newly established control commission.

Canada and the Asian Development Bank. Canada is a member of the Asian Development Bank, established in 1966 with Articles of Agreement patterned broadly after those of the World Bank and other international financial institutions. The Bank's subscribed capital stock is US(1966)\$1,005.4 million of which one half was paid in over the five-year period 1966-70. The balance of member-country subscriptions remains as a callable guarantee against which the Bank may sell its bonds on world capital markets. Asian regional countries, including Japan, Australia and New Zealand, have subscribed US\$625.4 million and non-regional countries have subscribed the remaining US\$380 million. Canada has paid US\$12.5 million to cover the paid-in portion of its original subscription of US\$25 million. The Bank approved a 150% increase in authorized capital stock in November 1972 of which Canada's share will be US\$37.5 million with 20% the paid-in portion.

For its ordinary operations which are financed from paid-in equity capital or any resources raised on world capital markets, the Bank expects to follow a pattern similar to that of the World Bank lending at rates of interest sufficient to maintain its own capacity to borrow. As at December 1972, the lending rate was 7½% and the Bank had made available 74 loans totalling US\$767.5 million from these ordinary resources.

The Bank also established Special Funds available to member countries on more flexible terms. Such special operations are financed by voluntary contributions and kept separate and distinct from the Bank's ordinary capital resources; Canada has made US\$25 million available for the Bank's special operations. As at December 1972, the Bank had supplied 44 loans totalling US\$201.5 million from these Special Funds to developing member countries of the region.

4.6.2.10 Canada and the OECD

The Organization for Economic Co-operation and Development (OECD) was established in September 1961, as successor to the Organization for European Economic Co-operation founded in 1948 by the countries of Western Europe to facilitate reconstruction of their war-shattered economies. With the OECD's establishment, Canada and the United States and later Japan (May 1964) and Australia (June 1971) joined with the countries of Western Europe to form what is today a major, intergovernmental forum for consultation and

co-operation among the advanced industrialized nations in virtually every major field of economic activity. At present, 23 countries are full members of the Organization, while Yugoslavia has a special status entitling it to participate in certain activities. The Organization's headquarters is in Paris.

The aim of the OECD is to facilitate the formulation of policy approaches which are conducive to balanced economic growth and social progress of both member and non-member countries. The Organization provides an instrument for assembling and examining knowledge relevant to policy-making and also a forum, meeting the year round, for the exchange and analysis of ideas and experiences from all member countries.

The Organization plays a significant role in harmonizing international economic and financial policy and is the main area where industrialized nations may hold consultations on questions of development assistance. The original focus of the OECD on more traditional economic, trade and development matters has altered and new activities have been undertaken in the areas of agriculture, the environment, industry, science and technology, and manpower policy. This broader orientation places increasing emphasis on the qualitative, as well as the quantitative, aspects of economic growth and is most recently seen in the Organization's work on the problems of environment and welfare in the context of economic policy. At the first Ministerial Council in 1961, member countries approved a growth target of 50% for the decade to 1970; that goal was considerably exceeded.

The OECD brings together government officials, representatives of private business, labour unions, universities and other non-governmental bodies in both deliberative and consultative capacities, at the international level. Within Canada, the Canadian Business and Industry Advisory Committee, comprising representatives of the Canadian Chamber of Commerce, the Canadian Council of the International Chamber of Commerce and the Canadian Manufacturers' Association was established in 1962 to ensure input from the business community. Arrangements also exist for consultation with Canadian labour organizations, universities and other non-governmental bodies. Representatives of provincial governments frequently attend OECD meetings when subjects of particular interest to the provinces are being discussed.

4.6.2.11 Canadian development assistance programs

The Canadian International Development Agency (CIDA) is responsible for the operation and administration of Canada's international development assistance programs. In 1972-73 Canada allocated \$491 million to development aid, compared to \$431.2 million in 1971-72. Of the 1972-73 budget, \$333.3 million was allocated to bilateral economic assistance programs, and \$131.9 million to multilateral programs in support of the United Nations, development banks and other institutions. Bilateral program allocations comprised \$46 million in technical assistance, \$195.8 million in economic assistance and \$91.5 million in international food aid. Under the bilateral program, grants and loans were almost equally divided. Most loans are for 50 years with no interest and no repayment required for the first ten years. Bilateral aid is usually tied to purchase of Canadian goods and services; however, 20% of the total may be spent outside Canada and a further portion (about 15%) may be used to pay shipping costs. During 1971, approximately 2,600 students and trainees from developing countries studied in Canada under CIDA programs. About 860 Canadian educators and 250 Canadian experts worked abroad on various professional and technical jobs. Under a unique feature of Canada's technical training program, 157 foreign students studied in "third countries" (i.e., countries other than Canada or their own).

In 1972-73, Canada supported Canadian private voluntary organizations engaged in international development programs and in development education with contributions of \$16.5 million which generated some \$45 million in financial and human resources. Of the \$10 million allocated to research into the problems of underdevelopment, \$8 million went to the International Development Research Centre. Canada's interest in regional financial institutions was confirmed in 1972 when Canada joined the Inter-American Development Bank and played a major part in establishing a special fund for the African Development Bank, to provide funds on concessional terms to African members.

The International Development Research Centre is an international organization, supported financially by Canada. Established in 1970 to initiate and encourage research focused on the problems of the world's developing regions, it fosters co-operation between the developed and

the developing world. In its role as co-ordinator of international development research, the Centre enlists the talents of natural and social scientists and technologists of both Canada and other countries. It also assists developing regions to build up the research capabilities, innovative skills and institutions required to solve their own problems. The Centre also offers research grants to PhD candidates and mid-career practitioners who are Canadian citizens or residents with three years landed-immigrant status.

Operations of the Centre are conducted under four program divisions: Agriculture, Food and Nutrition Sciences; Information Sciences; Population and Health Sciences; and Social Sciences and Human Resources. As at December 31, 1972 the Centre had approved 81 projects worth \$11 million involving 74 grantees in 60 countries. Most of the research activities and related seminars were conducted in developing countries by their research organizations.

The Canadian government gave the Centre \$2.4 million in 1970-71, \$2.5 million in 1971-72 and \$8 million in 1972-73.

Asia assistance program. Canada's development assistance program in South and Southeast Asia — the Colombo Plan — is the longest established (1950) regional bilateral aid program administered by CIDA, and also the largest in volume, with an allocation of \$153.4 million in 1972-73, compared to \$143.4 million in 1971-72. Despite this increase, the size of the populations of Asia results in a much smaller impact in terms of per capita receipts than is the case of aid from Canada to areas such as the Caribbean or parts of Africa.

Since 1950 Canada has provided more than \$1,660 million through its bilateral aid program in Asia, the greater share directed to Bangladesh, India, Indonesia, Pakistan and Sri Lanka (Ceylon). In recent years the nature of Canada's program in South and Southeast Asia has changed considerably. To improve its over-all effectiveness, multi-component projects are being developed. Capital assistance, in the form of loans and grants, is provided in specific economic sectors identified by the recipient countries as their development priorities in fields such as communications, transport, electric power development, agriculture, fisheries, mining, lumbering, medicine and public health.

Greater emphasis is being placed on commodity loan programs for some recipient countries such as the \$50 million allocated to India. Usually commodity aid consists of raw materials such as aluminum, lead, copper, asbestos, wood pulp or some semi-processed materials. Grants for foodstuffs also form an integral part of Canadian aid in South and Southeast Asia. The main items are cereal grains and rapeseed but others may be included under CIDA's emergency relief program. Through internal sale of these commodities recipient countries have been able to raise funds to meet local costs of development projects.

Canada's lines of credit program is another departure from traditional aid operations. Designed to help overcome problems of foreign exchange in developing countries, this program provides goods and services that are priority import requirements but difficult to obtain through regular financing arrangements. India and Indonesia have signed lines of credit agreements with Canada and other countries are discussing similar arrangements.

Canada is taking an active part in rehabilitation and reconstruction programs through its development assistance to Bangladesh. In 1972-73, \$51.5 million was allocated for Canadian-assisted projects and food aid.

Technical assistance represents another aspect of Canadian aid in Asia. More than 5,500 Asian people have had training in Canada in public administration, finance, agriculture, fisheries, forestry, engineering, business administration, medicine, health, education or social welfare. At the same time more than 650 Canadian experts have gone to South and Southeast Asia to provide technical assistance. As at January 1, 1972 there were 15 Canadian advisers and 40 Canadian educators serving under CIDA contracts in Asia. More than 440 trainees from developing countries in Asia were in Canada under CIDA auspices.

Latin American program. Although Canada has participated in the United Nations and World Bank programs in Latin America since their inception, Canadian development assistance really started in 1964 when Canada entrusted the Inter-American Development Bank (IDB) with a special fund, to be used for loans on concessional terms to member countries. The first allocation was for \$10 million. With subsequent annual allocations Canada had contributed over \$74 million by January 1972. All projects to be financed from the fund were suggested by the recipient countries, assessed by the IDB and approved by CIDA. Eighteen loans were made to finance projects in transportation, telecommunications, electric power, agriculture,

forestry and education. Colombia received \$16.7 million for power facilities on the Alto Anchicaya River, the largest hydro-electric project undertaken in Latin America. The fund was closed in May 1972 when Canada became a full member of the IDB. Loan repayments now revert to the Bank. Over the next three years Canada will contribute US\$100 million to the IDB.

In 1971 CIDA launched a program of bilateral technical assistance concentrated on Latin American agriculture, forestry, fisheries, education and community development. The first-year allocation was \$9.5 million and 40 projects had been approved by the end of 1972. During 1971-72 CIDA also contributed over \$1 million toward 86 projects undertaken by Canadian non-governmental organizations, at a total cost of \$2.9 million.

Francophone Africa assistance program. Since Canada first sent teachers to the French-speaking countries of Africa in 1961, the francophone Africa assistance program has grown into a substantial commitment, involving allocations of \$68.9 million to 21 countries in 1972-73. Important projects include the establishment of a business institute (INPE-HEC) in Algeria and a technical school (École polytechnique de Thiès) in Senegal, regional development schemes in Tunisia and Morocco, a public health program in Cameroon, forestry assistance in Congo (Kinshasa), the Unity Road highway in Niger, and rural electrification in Ivory Coast. In January 1972, 83 Canadian advisers and 489 teachers served in francophone Africa, and 486 trainees studied in Canada.

The Special Commonwealth Africa Assistance Plan resulted from discussions at the 1960 Commonwealth Prime Ministers meeting. Canadian assistance to Commonwealth Africa has grown steadily from an initial provision for technical and educational assistance to include a variety of capital projects and pre-investment surveys. Undertakings in the fields of energy, transportation, communications, agriculture and economic planning in the developing countries of eastern and southern Africa have balanced the original focus on West Africa. From 1960 to March 1973, Canada contributed \$264 million to bilateral development programs. In 1972-73 Canada allocated \$48.8 million to Commonwealth Africa plus \$10 million to Nigeria for locomotives. Technical assistance in January 1972 involved 352 Canadian advisers and educators in Commonwealth Africa under CIDA contracts and 383 trainees in Canada. The Volta River hydro-electric program in Ghana, telecommunications, transportation and school construction projects in Nigeria, harbour expansion and modernization in Tanzania and Kenya, a new water supply system for Dar es Salaam in Tanzania, a power generating project in Botswana, resource surveys in Kenya, and technical/vocational education in Zambia are among the large assistance programs under way.

Commonwealth Caribbean program. After the Federation of the West Indies was dissolved in 1962, Canada continued the program of economic and technical assistance started in 1958 when the Federation was set up. Under the program the Commonwealth Caribbean has received more Canadian development assistance per capita than any other region of the world. Canada's bilateral allocations of almost \$165 million since 1964, including \$19.1 million in 1972-73, have facilitated a variety of undertakings: bridges, water systems, hospital equipment and an island-wide transportation survey in Jamaica; an aerial survey, hospital equipment and a continuing program of rural electrification in Trinidad and Tobago; a water system, ground transportation studies, an aeromagnetic survey and two mapping programs, four aircraft, a hangar, radio and air navigation equipment and other assistance to civil aviation in Guyana; a promising animal-feed-from-sugar-cane experiment and an ambitious waterworks program in Barbados; six waterworks programs, four airport improvement schemes and a study of the banana industry on the Leeward and Windward Islands; forest fire-fighting equipment, an airport control tower and several technical assistance projects in Belize; new schools throughout the region; and buildings for the University of the West Indies on several islands. Further technical assistance included 319 Caribbean trainees studying agriculture, engineering, fisheries, forestry and medicine in Canada and 164 Canadian teachers and advisers working in the Commonwealth Caribbean in January 1972.

The Commonwealth Scholarship and Fellowship Plan, established in 1958 to give promising Commonwealth students the opportunity to study in other member countries, was designed to enrich the intellectual life of the participating countries and to promote equality of educational

opportunity at the highest level. Britain provides half the annual 1,000 scholarships and Canada a quarter. Since 1969 the Association of Universities and Colleges of Canada has administered the Plan although CIDA provides the funds. In January 1973, 227 students were on scholarship and actual expenditures were \$1.4 million.

In 1965 Canada introduced Research and Visiting Fellowships as part of the Canadian contribution to this Plan. Senior educators from other Commonwealth countries are invited to visit Canadian universities and educational institutions to carry out research in their particular field.

Commonwealth Fund for Technical Co-operation. Established in April 1971 following a Commonwealth Heads of Government Conference and administered by the Commonwealth Secretariat, this Fund is designed to provide Commonwealth countries with multilateral aid in the form of advisory services in economic planning and related fields. A further objective is to organize the third country training scheme which gives students the opportunity to study in other parts of the Commonwealth. Britain and Canada are major supporters of the Fund; Canada contributed \$350,000 in 1971-72.

Co-operation with the United Nations and international aid programs. In addition to the annual contributions to the United Nations Development Programme, encompassing all UN technical assistance programs, Canada arranges training programs for individuals studying here under the auspices of different UN specialized agencies. Canada also recruits Canadians to work for the agencies at their headquarters or in developing countries on specific assignments. Canadian allocations to multilateral organizations — including UN agencies, the World Bank and regional development banks — amounted to \$96.4 million in 1971-72 and will exceed \$131.9 million in 1972-73, for a total of about \$700 million since 1951.

4.7 Defence

4.7.1 The Department of National Defence

The Department of National Defence was created by the National Defence Act, 1922, which established one civil department of government in place of the previous Departments of Militia and Defence, Naval Service and the Air Board, and now operates under authority of RSC 1970, c.N-4.

The Minister of National Defence has the control and management of the Canadian Forces, the Defence Research Board and all matters relating to national defence establishments and works for the defence of Canada. He is also responsible for the Canada Emergency Measures Organization and for certain civil emergency powers, duties and functions as outlined in Order in Council PC 1965-1041, dated June 8, 1965, as amended. In addition, he is responsible for presenting before the Cabinet matters of major defence policy for which Cabinet direction is required.

The Deputy Minister administers the Department and maintains a continuing review of and control over the formulation of policy with respect to resources. Each of five Assistant Deputy Ministers administers a Group responsible for policy, finance, personnel, materiel and evaluation. Also responsible to the Deputy Minister are the Chief of Program, Judge Advocate General, Director General Information, Director General Departmental Administrative Services, and the National Co-ordinator of the Canada Emergency Measures Organization.

The Chief of the Defence Staff controls and manages the Canadian Forces and is responsible for maintaining an effective military force to meet defence objectives. The Vice Chief of Defence Staff and the Deputy Chief of Defence Staff are responsible to the Chief of the Defence Staff.

The Chairman of the Defence Research Board provides scientific advice and conducts and/or supports research projects related to national defence.

The Defence Council meets at regular intervals to provide a channel of communication between the Minister and the senior officials of the Department through briefings, the exchange of views on policy matters, and discussions of specific matters requiring the approval, decision and/or direction of the Minister.

The Defence Management Committee considers all major and significant matters of policy, plans, programs and administration requiring the decision and direction of the Deputy Minister, the Chief of the Defence Staff and/or the Chairman of the Defence Research Board prior to their submission to the Minister as required.

The Minister of National Defence is responsible for administering the following laws which relate to the Department of National Defence: National Defence Act (RSC 1970, c.N-4), Defence Services Pension Continuation Act (RSC 1970, c.D-3), Canadian Forces Superannuation Act (RSC 1970, c.C-9) and Visiting Forces Act (RSC 1970, c.V-6).

Liaison in other countries. The Chief of the Defence Staff, who is the Canadian Military Representative to the North Atlantic Treaty Organization, is responsible for advice on all NATO military matters and acts as a military adviser to the government and to Canadian delegations to NATO. For purposes of liaison and the furtherance of international co-operation in defence, Canada also maintains: the Canadian Defence Liaison Staff London, representing the Canadian Armed Forces and the Defence Research Board in Britain, the Commander of which is the principal military adviser to the Canadian High Commission in London; the Canadian Defence Liaison Staff Washington, representing the Canadian Armed Forces and the Defence Research Board in the United States, the Commander of which is the principal military adviser to the Canadian Ambassador in Washington, and is the Canadian National Liaison Representative to the Supreme Commander, Allied Command Atlantic (SACLANT) Headquarters; two logistic liaison units also located in the United States; in Brussels, a Canadian member of the NATO Military Committee in Permanent Session, a Military Adviser to the Canadian Permanent Representative to the North Atlantic Council and also a Canadian National Military Representative to Supreme Headquarters Allied Powers Europe (SHAPE); and Canadian Forces Attachés in various countries throughout the world. In addition, a number of defence matters of concern to both Canada and the United States are considered by the Permanent Joint Board on Defence, which provides advice on such matters to the respective governments.

4.7.2 The command structure of the Canadian Forces

The Canadian Forces are organized on a functional basis to reflect the major commitments assigned by the government. Under this concept, all forces devoted to a primary mission are grouped under a single commander who is assigned sufficient resources to discharge his responsibilities. Specifically, the Canadian Forces are formed into National Defence Headquarters and seven major Commands reporting to the Chief of the Defence Staff.

Mobile Command. The role of Mobile Command is: to provide military units, including tactical air support, suitably trained and equipped, for the protection of Canadian territory; to maintain operational readiness of combat formations in Canada required for overseas commitments; and to support United Nations or other peacekeeping operations.

The forces assigned include: three airportable combat groups in Canada; the Canadian Airborne Regiment; the Canadian Contingent of the United Nations Force in Cyprus; two tactical fighter squadrons; four tactical helicopter squadrons and one helicopter operational training squadron; one transport helicopter squadron; and one combat training centre.

The Militia and Air Reserve components are also controlled and administered by Mobile Command.

The Militia. The Militia is assigned its traditional role as a sub-component in support of the Regular Force. Under the present organization, units of the Militia have been placed under either the Commander, Mobile Command or Canadian Forces Communication Command.

Mobile Command exercises command and control of 121 Militia combat and service units through five Militia Area Headquarters and 21 Militia Districts in the following centres: Esquimalt, Vancouver and Victoria; Edmonton, Southern Alberta, Saskatchewan and Winnipeg; Hamilton, London, North Bay, Ottawa, Toronto and Windsor; Montreal and Quebec; and West Nova Scotia, Cape Breton, West New Brunswick, East New Brunswick, Prince Edward Island and Newfoundland. Mobile Command Militia is charged with: providing trained individuals for augmentation and reinforcement of the Regular Force; providing trained sub-units to support the field force for the defence of Canada and the maintenance of internal security; providing trained personnel for the augmentation of the civil emergency operations organization; and forming the base on which the Regular Force could be expanded in the event of an emergency.

The 12 Canadian Forces Communication Command Militia Units are commanded and controlled through the five Regular Force Communication Groups and are centred in:

Vancouver, Edmonton and Calgary; Regina and Winnipeg; Toronto and Ottawa; Montreal and Quebec; and Saint John, Halifax and Charlottetown. Their tasks collectively include: the augmentation of Canadian Forces Communication Command in an emergency; the provision of communication support to Mobile Command Militia in emergency operations (peace); the provision of instructors for the training of Mobile Command unit signalers; and the provision of communications support for control of Mobile Command Militia tactical exercises.

Air Reserves. The Air Reserve is organized into four Air Reserve Regional Headquarters at Montreal, Toronto, Winnipeg, and Edmonton and six flying squadrons of six DHC Otter aircraft each. Air Reserve Squadrons are located at Montreal (two), Toronto (two), Winnipeg (one) and Edmonton (one). The Air Reserve is required to provide light tactical air transport support to the Regular Force and in particular to Mobile Command ground forces. Air Reserve tasks include logistic airlift, air evacuation of patients, aerial surveillance and photography, and communications and liaison.

Maritime Command. All Canadian Maritime Forces, both sea and air, are under the command of the Commander, Maritime Command whose Headquarters is in Halifax. The Deputy Commander is the Commander, Maritime Forces Pacific with Headquarters in Esquimalt. The role of Maritime Command is to defend Canadian interests from assault by sea and to support measures to protect Canadian sovereignty. Support is provided to NATO by assisting in conducting anti-submarine warfare in the Allied Command, Atlantic. The Commander, Maritime Command is the NATO Commander of the Canadian Atlantic Sub-Area of the Western Atlantic Command, under the Supreme Commander, Allied Command Atlantic (SACLANT). Additional roles are to provide sea lift required by Mobile Command, and to conduct search and rescue operations within the Atlantic and Pacific Search and Rescue Areas (roughly, the Atlantic Provinces and British Columbia).

As at December 1972, the following vessels were in service in Maritime Command: 23 Destroyer Escorts/Destroyer Escorts Helicopter Equipped including three new Iroquois Class Helicopter Destroyers; three Operational Support Ships; three Oberon Class Submarines; one Tench Class Submarine; six Bay Class Coastal Patrol Vessels (employed as training vessels); and two Escort Repair Vessels (retained in service as alongside workshops and temporary accommodation vessels). One Iroquois Class Helicopter Destroyer in the final stages of construction is expected to join the fleet in 1973.

The Naval Reserve is an essential component of Maritime Command, and has been designated as a ready reserve. Its primary function is to provide trained personnel to augment the fleet in time of emergency. Another essential role is to provide and maintain naval control of shipping and protection of fishing vessels capability in time of emergency or war to meet national and NATO requirements. There are 16 naval reserve units situated in major Canadian cities.

Air Defence Command. Air Defence Command participates with the United States in the air defence of North America, through NORAD. It has command of three interceptor squadrons, one SAGE control centre, two BUIIC centres and two transcontinental radar lines. Operational control of NORAD assigned forces is exercised by HQ NORAD.

Air Transport Command. The main role of Air Transport Command (ATC) is to maintain an operationally effective air transport force to meet Canada's defence commitments. In addition to this main role, ATC is responsible for functional and administrative control of all primary search and rescue (SAR) units in Canada as well as the operational control of SAR activities in the Eastern Search and Rescue Area. It has four squadrons operating medium- and long-range cargo and troop carrying aircraft as well as four transport and rescue squadrons.

Training Command. The role of Training Command is to provide individual training for the Canadian Forces and to conduct search and rescue operations within the Western Search and Rescue Area (roughly, Manitoba, Saskatchewan and Alberta). All former training units of the RCN, the Canadian Army and the RCAF where individual training is carried out have been placed under functional control of Training Command. The Canadian Military Colleges (Royal Military College, Royal Roads and Collège militaire royal de Saint-Jean), the Staff Colleges and National Defence College are under the direct control of National Defence Headquarters. Land/air warfare operational training and basic parachutist training are the responsibility of Mobile Command; basic fixed-wing and helicopter pilot training are a Training Command responsibility.

The Canadian Forces Communication Command (CFCC). The CFCC commands all fixed communications installations within Canada which provide communications for the command and control of the Canadian Forces and for the support of emergency government.

Canadian Forces Europe. The Canadian Forces allocated to support NATO in Europe are part of Canadian Forces Europe. The land element is No. 4 Canadian Mechanized Battle Group operationally responsible to the Central Army Group. The air element, No. 1 Canadian Air Group, consisting of three CF-104 Starfighter squadrons, is operationally assigned to No. 4 Allied Tactical Air Force. These elements are located in the Baden-Baden area of the Federal Republic of Germany and are supported administratively by CFB Europe at Lahr.

Administration of military bases in Canada. Staffs and services required below Command Headquarters level to administer and support units based in a particular locality have been organized on Canadian Forces bases. The primary role of each base is to provide base-level administration and supporting services to those units located on or near the base. Each base has been allocated to a functional Commander, to whom the base Commander reports.

Function/regional organization. Functional Commanders have been assigned a regional as well as a functional responsibility for such actions as representation to provincial governments, aid of the Civil Power, emergency and survival operations, and administration of cadets, as well as regional support services for all units in the region.

Canada has been divided into six regions, five of which have been assigned to functional Commanders as follows: Atlantic (Newfoundland, Nova Scotia, Prince Edward Island, New Brunswick) — Maritime Command; Eastern (Quebec) — Mobile Command; Central (Ontario) — Air Transport Command; Prairie (Manitoba, Saskatchewan, Alberta) — Training Command; and Pacific (British Columbia) — Maritime Forces Pacific. One region, comprising the Yukon Territory and Northwest Territories, has been assigned to Commander Northern Region with Headquarters in Yellowknife, NWT who also exercises a co-ordinating function for all military activities in the region.

4.7.3 Operations in 1972

Maritime air, surface and sub-surface forces participated in three NATO exercises carried out in the North Atlantic and in combined exercises with forces from New Zealand, Australia, Britain and the United States on both the Pacific and Atlantic coasts. Training exercises were conducted in the Bermuda, Caribbean and Southern California areas in order to maintain the Maritime Forces at an operational level. In addition, an exercise was held in the Arctic to assess capabilities in northern waters. One destroyer was assigned to the NATO Standing Naval Force Atlantic for a period of five months.

Argus aircraft from both east and west coast squadrons maintained daily long-range patrols and surveillance of ocean areas adjacent to the Canadian coastline and in the Arctic; many hours were also flown on search and rescue missions. Shore-based Tracker aircraft flew similar missions, concentrating on coastal patrols, fisheries protection and pollution prevention. Between exercises, ships made goodwill visits to the United States, Britain, the Netherlands, France, Spain, Australia, New Zealand, Fiji, Samoa, Tonga, Tahiti, the West Indies and Greenland. Argus crews conducted exchange visits with United States, Britain and France.

In fulfilment of obligations under NATO, Canada continued to provide ground forces for the defence of Western Europe. In September a 3 RCR Battalion Group took part in exercise Strong Express, one of the largest exercises ever conducted by NATO. This exercise included deployment by air to northern Norway and redeployment to Canada by air and sea.

To exercise Canadian sovereignty and to familiarize the maximum number of troops with the problems of living, moving and fighting in the North, exercise New Viking continued to be the Command's most important northern exercise. From advanced bases in Churchill and Resolute Bay forces were deployed to forward patrol bases in all parts of the Canadian archipelago.

In addition, the Canadian Airborne Regiment which is the Command's quick reaction force for both defence of Canada and international peacekeeping operations, exercised in the Fort St. John area of British Columbia in January and trained in Jamaica from mid-March to the end of April.

The Canadian Forces continued to provide support for United Nations operations. Canadian participation in the UN forces in Cyprus included provision of a reduced Infantry

Battalion, a Canadian Contingent Headquarters and a Canadian element in the UN headquarters — a total of 589 officers and men. There were also 39 officers and men employed on other UN missions in the Middle East, Kashmir and Korea.

In addition to its UN commitments, Canada had six officers and men participating in the International Commissions for Supervision and Control in Viet-Nam, Khmer Republic (Cambodia) and Laos. The Commission in Khmer Republic adjourned sine die on December 31, 1969 and the delegation subsequently withdrew.

In late 1971, the three CF-104 squadrons which comprise No. 1 Canadian Air Group, Canada's NATO air contribution to Europe, terminated the nuclear role and undertook the conventional role of support of Allied Forces in Central Europe. The CF-5s continued air support operations in co-operation with land forces which are engaged in Defence of Canada Exercises aimed at improving the Canadian Forces capability of operating effectively in the Canadian Arctic.

Air Transport Command provides the airlift needed to meet national and international emergencies that require military participation. It also provides search and rescue services for aircraft to meet Canada's obligations under the terms of membership in the International Civil Aviation Organization, and it co-ordinates marine search and rescue operations within Canada's areas of responsibility.

In 1972, strategic and tactical airlift by Command aircraft enabled other elements of the forces to participate in a wide range of national and international responsibilities embracing national sovereignty and development, North American defence, NATO, humanitarian missions and contributions to world peace and security.

About half of the Command's flying is devoted to joint exercises with Mobile Command and other Canadian Forces Commands, often in conjunction with NATO allies. The remainder is used to support Canadian Forces Europe, isolated bases in northern Canada, Canadian military and civil missions abroad, and DND and other government agencies in Canada. These operations and exercises provide the experience the Command needs to maintain readiness for its emergency tasks. During 1972, a total of almost 490,000 military passengers and 56 million pounds of cargo were airlifted.

In accordance with obligations embodied in the National Defence Act and departmental policy, the Canadian Forces in 1972 provided assistance in response to requests from various civil authorities. Major undertakings were: assistance to the Ministry of Transport during the clean-up of the oil spill resulting from the grounding of the SS *Vanlene* in Barkley Sound, off Vancouver Island, in March 1972; assistance to the Ontario Ministry of Transport and Communications, by constructing a twin Bailey Bridge on Highway 17 near Petawawa in May 1972; assistance to Alberta in fighting forest fires during June 1972, and to Nova Scotia in forest fire-fighting during May and June 1972; assistance to the Department of the Solicitor General, which assisted the Ontario Provincial Police in a search for 14 escapees from Millhaven Federal Penitentiary in July 1972; across Canada from 25 locations, Canadian Forces Explosive Ordnance Disposal Teams responded to an average of 47 requests per month from police agencies to assist in rendering safe a great variety of explosives and explosive devices; and assistance to the Department of Manpower and Immigration from September to November 1972, when 4,420 Ugandan Asians immigrated to Canada on an emergency basis. Assistance consisted of 12 medical technicians who were employed in the processing of applicants in Kampala, and the provision of reception facilities for the immigrants at Longue Pointe Barracks, Montreal.

4.7.4 Training

All recruit and most basic and advanced trades training in support of the Canadian Armed Forces takes place at various schools under the supervision of Training Command. Maritime Command and Mobile Command maintain functional control of trades and operational training for their personnel.

The Combat Arms School of the Combat Training Centre, CFB Gagetown, NB, conducts training for officers and men of the armoured, artillery and infantry units of the Regular and Reserve Forces, ranging from basic trades to advanced courses. Similar courses for French-speaking personnel are given at the Combat Arms School Detachment, CFB Valcartier, Que. Training for field engineers and construction trades is given at CFB Chilliwack, BC.

Recruit training takes place at CFB Cornwallis, NS, for English-speaking recruits and at CFB Saint-Jean, Que., for French-speaking recruits. Basic technical training in French is given also at CFB Saint-Jean, Que. and an expanding trades-training program in that language is given at most bases and schools.

Saint-Jean is also the site of the English-French Language School although the official languages are taught on a limited scale at selected Canadian Forces Bases, and in civilian centres under the auspices of the Public Service Commission. Training in other languages is given at the Canadian Forces Foreign Language School in Vanier, Ont.

Support trades training is conducted at the School of Administration and Logistics, CFB Borden, Ont., and technical trades training is conducted at a number of bases across Canada. Two Fleet Schools, one at CFB Esquimalt, BC, and the other at CFB Halifax, NS, provide basic and advanced Maritime trades training and have training facilities for the operational warships on the east and west coasts.

Flying training to "wings" standard is based in the Prairie Provinces – pilot selection and basic helicopter flying training at Portage la Prairie, Man., basic fixed-wing flying training at Moose Jaw, Sask., and advanced flying training at CFB Cold Lake, Alta. Navigator and observer training are given at CFB Winnipeg, Man. The operational Commands maintain operational flying training units, and technical training units to give equipment-oriented training to tradesmen in these Commands.

Canadian Military Colleges. The three Canadian Military Colleges are the Royal Military College of Canada, founded at Kingston, Ont., in 1876; Royal Roads Military College, established in 1941 near Victoria, BC; and Collège militaire royal de Saint-Jean, established at Saint-Jean, Que., in 1952, primarily to meet the needs of French-speaking cadets. In 1959, the Ontario Legislature granted the Royal Military College a charter empowering it to grant degrees. In 1967, the Canadian Services Colleges, as they were then known, were re-designated as the Canadian Military Colleges.

The role of the Colleges is to educate and train officer cadets and commissioned officers for a career of effective service in the Canadian Forces. Courses of instruction are designed to develop character and to provide a balanced liberal, scientific and military education leading to degrees in arts, science and engineering. The Royal Military College of Canada accepts senior matriculants and offers a four-year course. Royal Roads Military College accepts senior matriculants who, on successful completion of the second year, go to Collège militaire royal de Saint-Jean or to the Royal Military College of Canada for their third and fourth years. Collège militaire royal de Saint-Jean accepts junior and senior matriculants to pursue a five- or four-year program; the final two years in some disciplines are completed at the Royal Military College.

During the 1972-73 academic year, 1,217 officer cadets were enrolled at the Canadian Military Colleges, 570 of them at the Royal Military College, 218 at Royal Roads Military College and 429 at Collège militaire royal de Saint-Jean.

Staff and defence courses, Canadian Forces officer education system. The Chief of Defence Staff has authorized the development and implementation of a new four-level system of integrated and sequential command staff courses for the professional education and development of the Canadian Forces officers.

The Junior Staff Course (Level A) commenced operations in April 1970 at the Canadian Forces Staff School, Avenue Road, Toronto, Ont. It is a ten-week course conducted four times per year for junior captains selected from all classifications on a quota basis. It has as its aim "to prepare junior officers to perform staff functions of a general nature that are appropriate to their rank; and to provide the foundation for their subsequent professional development". The course includes studies in staff duties, the communication process, service knowledge leadership and management, professionalism and current affairs.

The Junior Command and Staff Course (Level B) (Land) will commence in March 1974 at Fort Frontenac, Kingston, Ont., replacing in part the Canadian Land Forces Command and Staff Course at Kingston which will cease operations in June 1973.

The Command and Staff Course (Level C) is scheduled to commence in September 1974 at Armour Heights in Toronto replacing the current Canadian Forces Staff College and part of the current Canadian Land Forces Command and Staff College course in the Canadian Forces officer education system.

The National Defence College Course (Level D), located at Fort Frontenac, Kingston, Ont., is designed to provide for joint education of senior military officers and civilian officials. It is a 46-week course for senior military officers and civilian officials of government departments and industry who are due for appointment to positions of higher responsibility. It enables them to study together, in the atmosphere of an advanced graduate school, those aspects of national and international affairs which determine or significantly affect Canada's defence and related policies. Lecturers are chosen from the leaders in various fields in Canada and other countries. In addition, field trips to certain parts of Canada, the United States, Europe, Asia, Africa, Australia and Latin America familiarize students with conditions and influences in their own country and in other countries.

4.7.5 The cadet movement in Canada

Three civilian agencies sponsor the cadet movement in Canada. The Air Cadet League of Canada, the Army Cadet League and the Navy League of Canada promote the Royal Canadian Air Cadets, the Royal Canadian Army Cadets and the Royal Canadian Sea Cadet Corps for boys between the ages of 13 and 18. In addition the Navy League has two other organizations, the Navy League Cadets for boys ages 11 to 13 and the Wrenette Corps for girls. The Department of National Defence supports these Leagues in their objectives of developing good citizenship, leadership and physical fitness among the youth of this country, and as a main activity, provides a number of summer camps across the country, and also exchange programs with the USA, Britain, and several European and Caribbean countries, whose cadets visit Canada at the same time, and take part in Canadian Cadet Camp activities.

4.7.6 The Defence Research Board

The Defence Research Board is responsible for scientific research in the Department of National Defence. The Board consists of a full-time chairman and vice-chairman, five ex-officio members from within the Department and from the National Research Council, and a varying number of members appointed by the Governor in Council from universities and industry.

Research is carried out in the Board's seven research establishments and through financial support to universities and to industry. It is specifically oriented to military requirements and covers a wide variety of scientific disciplines. Over the 25 years of the Board's existence, many of the developments arising from the research have been of value in the civilian field as well as the military.

There are, as well, effective arrangements with Canada's allies to ensure mutual use of defence scientific knowledge, resources and facilities. The Board represents Canada on a number of specialist committees through which NATO's scientific endeavours are co-ordinated. Liaison offices are maintained in London, Washington and Paris.

4.7.7 Canada Emergency Measures Organization

The Canada Emergency Measures Organization was brought into being to initiate, stimulate and co-ordinate the civil aspects of defence policy delegated to federal departments and agencies to meet the threat of nuclear war on Canada. It is also responsible for providing support and guidance to provincial and municipal authorities in the development of their emergency capabilities.

Plans exist at all levels of government for the provision of emergency arrangements for health services, welfare services, employment of manpower and national resources and for practically every area of endeavour that is required to respond in an emergency situation.

The *1969 Canada Year Book*, pp. 1201-1203, contains details of the establishment, powers and functions of Canada EMO, together with an outline of provincial government civil emergency responsibilities.

4.7.8 Defence Construction (1951) Limited

Defence Construction (1951) Limited (DCL) is a Crown corporation as defined in Part VIII of the Financial Administration Act and listed in Schedule "C" in the Act. As its name implies, the corporation's prime responsibility is the contracting for and supervision of construction projects for the Department of National Defence (DND).

Specifically, DCL's function is to obtain tenders, to make recommendations regarding awards, to award and to administer major construction and repair and maintenance contracts.

As an integral part of contract administration it is responsible for the supervision of the construction work, the certification of contractors' progress claims and that the work has been satisfactorily completed in accordance with the contract. The corporation also engages architects and engineers to prepare plans and specifications in accordance with the requirements of DND.

In addition to acting as the contracting agency for DND, DCL provides assistance and technical advice, when requested, to other government departments and agencies relative to construction matters. It also administers defence construction projects in Canada which are financed by the Government of the United States.

DCL maintains a head office in Ottawa with branch offices in Halifax, Montreal, Toronto, Winnipeg and Vancouver. A European office is located in Lahr, Federal Republic of Germany.

Chapter 5

Demography

Demography is that branch of science which deals with the growth, distribution, density, characteristics, vital statistics, migration, etc., of human population — in short, the life conditions of people. The present chapter is concerned with this subject as it applies to the population of Canada. It differs from previous editions of the Canada Year Book in bringing together in one chapter these various demographic elements. The subject is treated by providing first a brief picture of population growth in Canada, and then a summary of the most recent data from the 1971 Census on the distribution and demographic characteristics of the population, households and families (Sections 5.1 to 5.4). A second major part of the chapter is concerned with the vital processes (fertility, mortality, nuptiality) which play such a major role in shaping population trends and composition (Sections 5.5 to 5.8). Finally, there are the migration factors (immigration and emigration) which also have a significant influence on population change and structure (Section 5.9).

5.1 Population growth

The most fundamental fact about a population is its rate of growth which affects almost every aspect of the national life. The opening up of a new continent and the gradual evolution of an industrial and urban economy form the historical background for population growth in Canada. Several demographic elements have combined to produce this growth: births, deaths, immigration and emigration, which are the processes, or components, of population change.

5.1.1 The early period

The growth of Canada's population today is the culmination of a trend which began around the early 17th century with the arrival of the first French settlers. From this beginning, the population of the area now known as Canada (excluding Newfoundland) grew from a handful of colonists and an unknown number of native Indians and Eskimos in 1611 to about 2.4 million in 1851 and 3.7 million at the first Census of Canada in 1871. Rough estimates indicate there were about 136,000 Indians in 1851.

Growth rates in the early settlement years were very irregular; the immigrant population grew rapidly while the native population remained almost stationary or declined as a result of attrition from warfare and disease. Between 1681, when the number of settlers passed the 10,000 mark, and 1851 the average annual growth rate of the non-native population in each decade varied between 1.6% and 4.5%; the average annual growth rate for the whole period was 3.2%. The small size of the initial population and the continuous expansion into empty lands were contributing factors in the rapid growth rates in the early periods.

The decade 1851-61 was one of surging growth, second only to the growth rate in the first decade of the present century (Table 5.1). The average annual growth rate during this period was 2.9%, with about 23% of the total population increase due to net migration; over 350,000 immigrants arrived and there was very little emigration. A long period of slow growth followed and lasted to the beginning of the 20th century. Between 1861 and 1901 the average growth rate was closer to 1%, matched only by the rate during the depression period of the 1930s. This slow growth toward the end of the last century was due to heavy emigration resulting in a net migration loss (Table 5.2). Emigrants included elements of both the Canadian and foreign-born populations. While many immigrants continued to come to Canada during this period a large number of them re-emigrated to the United States where prospective settlers were offered more favourable economic and climatic conditions. The westward movement in the United States attracted not only settlers from every part of that country, but from Canada as well.

5.1.2 Recent trends

The beginning of the present century witnessed a flood of immigrants which helped to raise the growth rate to 3.0% per annum during 1901-11, the highest rate recorded since 1851. Over 1.5 million immigrants entered Canada in this decade, as many as had arrived during the previous 40 years. As a result, over 44% of the total population increase during this period was due to migration gain.

Following the phenomenal increase during 1901-11, the intercensal rate of increase dropped during each successive decade until it reached a low of 10.9% during 1931-41 when the reduced birth rates during the economic depression seriously affected population growth. Moreover, immigration during this period was negligible, and as a result there was a net migration loss of about 92,000 persons.

After 1941, the population again registered an accelerated growth, reaching a near-record rate of expansion of 30.2% in 1951-61, nearly three times the rate of increase in 1931-41. Part of the accelerated increase in population after 1941 was accounted for by the addition of Newfoundland in 1949 but the surge in birth rates (commonly referred to as the "baby boom") and the upswing in immigration during the immediate postwar years were the main factors of growth during the period.

After 1956 a steady decline in population growth occurred, reaching a rate of 1.5% per annum in 1966-71. This gradual fall in the growth rate in recent years — the lowest except the depression decade — has evoked special interest mainly because it occurred after the growth

Population growth in Canada, 1851-1971

rate reached a peak of 3.3% in 1956-57 and at a time when the economic outlook was favourable for high growth rates. The current annual growth rate (1971-72) is estimated to be about 1.2%. In absolute numbers, between 1966 and 1971 the population increased by 1,553,000, or 310,000 a year, which was about 25% lower than the increase during 1951-56. The sharp reduction in population growth in recent years due to the marked decline in birth rates and lower immigration has caused speculation on the possibility of Canada's population growth approaching the zero level in the very near future.

5.1.3 Future prospects

The dominant component of population growth in Canada since 1851 has been natural increase. This trend is likely to continue in the future with a modest contribution from migration. Of the two components of natural increase (births minus deaths), the birth rate will continue to be the dynamic and crucial factor of growth. Moreover, fluctuations in birth rates can create major economic and social problems as society adjusts itself to the effects of such fluctuations. For example, although the postwar "baby boom" is long past, society is now feeling the impact of this generation on the labour market and other aspects of the national economy. Similarly, problems associated with the sharp drop in the birth rate since 1957 are being felt, for example, by school systems as smaller numbers of children enter school.

Because of the importance of the fertility factor, the tempo of future growth depends mainly on whether the current total fertility rate of 2.19 births (1971), which is close to the "replacement level" of 2.13 births under current mortality conditions, will remain constant, fall or rise in future. A fertility rate close to the replacement level does not mean that Canada will soon reach zero population growth. Calculations show that even if immigration ceased, and the average fertility rate were only 2.13, the population would continue to grow until about the year 2040, when birth and death rates would each stabilize at about 13 per 1,000 population. This long delay in achieving zero growth may be attributed to the current high percentage of young people who are moving into the child-bearing age groups.

Table 5.3 summarizes the results of two series of population projections for Canada prepared under different assumptions of mortality, fertility and migration. Series A uses the lowest fertility assumption as stated in the Table with constant mortality level and zero net migration. Under these assumptions, the total population will increase from 21.6 million in 1971 to 24.5 million in 1986, and will reach 26.5 million by 2001. Because the assumed fertility rate does not reach the lowest point until 1985, the full impact of fertility decline on population growth becomes evident only thereafter. The annual growth rate will be lowest at 0.3% by 2001. The population will become more aged with declining proportions of young people and increasing proportions of adult and old-age population.

Series B gives a higher and more realistic projection taking into consideration the more likely changes in mortality, fertility and migration. As described in Table 5.3 this projection yields a total population of 26.5 million by 1986 and 31.4 million by 2001. In terms of rates, the annual growth increases from 1.3% in 1971 to 1.4% in 1986, and then it decreases, reaching 1.0% by 2001. The growth rate is expected to be higher than the 1971 rate until 1986 when the fertility rate will reach the lowest level assumed.

5.2 Population distribution

5.2.1 Provincial and sub-provincial areas

Decennial and quinquennial censuses of Canada make possible periodic assessments of the size and location of the nation's human resources. They provide data on the distribution of population for many types of geographical, political, and statistical entities. Used as benchmarks, the census counts enable annual estimates to be made for some of the larger areas (e.g., provinces, counties, metropolitan areas). A small selection of these data is presented in this Section, embodying results of the 1971 Census and later estimates for 1972 where applicable.

Provincial trends, 1951-71. The growth of Canada's population has not been uniformly distributed among the provinces. The distributions for the 1951-71 period are presented in Table 5.4 and they show substantial variations in rates of growth. This is evident from the number of provinces with higher or lower growth rates compared with the national average. Ontario, British Columbia, Alberta and the Northwest Territories had growth rates higher

100 years of population growth

than national figures in all five-year periods between 1951 and 1971. However, a decline in the rate of growth over the past 20 years occurred in all provinces as birth rates began to fall in the mid-1950s. The most spectacular change took place in Quebec where the rate of growth declined by about 70% between 1951-56 and 1966-71 (i.e., from 14.1% to 4.3%). The growth rate in Quebec in 1966-71 was less than half of the rate during the preceding five-year period.

The slow population growth of 1966-71 was not shared equally among the provinces. The lowest rates occurred in the Atlantic Provinces, Quebec, Manitoba and Saskatchewan. Saskatchewan registered an actual decline in population during this period. British Columbia had the highest growth rate (16.6%) in 1966-71, followed by Alberta and Ontario. The uneven rates of increase among the provinces in 1966-71 imply that during this period net migration reinforced the natural growth of population in Ontario, Alberta and British Columbia and depressed it in all others (see Table 5.5).

Provincial estimates, 1972. In addition to the five-year census counts, estimates are constructed for the total population of Canada and for each province on both an annual and

quarterly basis. The estimates of population begin with the preceding census counts, to which are added the births of each year and from which the deaths are subtracted; immigrants are added and an estimate of emigrants subtracted. Family allowance statistics showing the number of migrant families by province are used in estimating interprovincial shifts in population. Finally, the next succeeding census serves as a basis for revision of all annual estimates of each intercensal period.

Table 5.6 shows the revised annual population estimates by province for the years 1967 to 1970, and the provisional estimates for 1972. Included in the Table are the actual enumerated counts for the two "benchmark" census years of 1966 and 1971. The estimate for Canada of 21,830,000 population at June 1, 1972 is the result of adding 351,000 births and 118,000 immigrants to the June 1, 1971 Census figure of 21,569,000 and then subtracting 161,000 deaths and a residual of 47,000 representing mainly emigrants.

Cities, towns and villages. As at June 1, 1971, some 65.4% of Canada's population lived in 2,120 centres classified as incorporated cities, towns and villages. These are grouped into 13 broad size categories in Table 5.7. There were only two cities within whose incorporated boundaries the population was over 500,000 (Montreal and Toronto), representing a combined 8.9% of the total population. At the other end of the scale, 1,093 or one half of all incorporated cities, towns and villages had less than 1,000 population, but together they accounted for only 2.1% of Canada's population.

Canadian cities and towns having a population of over 50,000 in 1971 are listed in Table 5.8 together with figures for 1961 and 1966. The date of incorporation to their present status of a city or town is indicated also. Since the population counts for the three census periods relate to the incorporated limits of the city or town at each of these dates, the growth figures are not strictly comparable in those instances where boundary changes due to annexations, etc., have taken place. Asterisks in the table indicate all cases where such changes have occurred.

Metropolitan areas. For census purposes a metropolitan area represents the main labour market of a continuous built-up area having a population of 100,000 or more. The growth of each of the 22 census metropolitan areas can be observed over the period 1951-71 in Table 5.9 where the populations of these areas in earlier censuses have been adjusted to conform to the boundaries delineated for the 1971 Census. For many purposes these figures, which essentially measure the size of Canada's major urban agglomerations, are more meaningful than the data relating only to the incorporated limits of the central cities shown in Table 5.8.

The proportion of Canada's population living in the major metropolitan centres has been steadily increasing in recent years to the point where over one half (55.1%) now reside within the boundaries of the 22 metropolitan areas as defined for the 1971 Census. Calgary showed the highest rate of growth in the most recent 1966-71 period at 22.1%, followed by Edmonton at 16.5%. However, the greatest actual gains were registered by Toronto which increased by 338,000 and by Montreal which gained 172,000. At the same time, Vancouver joined these two metropolitan centres in becoming the third urban agglomeration in Canada to pass the 'over-a-million' population mark.

Because of the growing interest in the expanding population of the larger metropolitan areas of Canada, a series of intercensal estimates was begun in 1957. Table 5.9 includes these estimates for 1972 along with the census counts of 1951-71. As in preparation of intercensal population estimates for provinces, the births occurring in the metropolitan areas between June 1, 1971 and June 1, 1972 were added to the population at the census date and deaths subtracted. Immigrants over this period reporting these metropolitan areas as places of destination were added and allowances made for losses in population by emigration. Also, the net in-movement caused by internal migration was calculated from family allowances and other data.

5.2.2 Population density

At six persons per sq mile in 1971, Canada's crude or average population density still ranks among the lowest in the world. Table 5.10 shows that if the Yukon Territory and Northwest Territories were omitted from this calculation, there would be ten persons per sq mile in 1971 compared to eight in 1961 and six in 1951. However, such average density figures over all types of land terrain and open spaces in the country or in individual provinces obscure the high urban densities which can reach close to 20,000 persons per sq mile as in the over-all

Percentage increase of the population of Canada and the metropolitan areas 1966-72

figure for the cities of Montreal and Toronto. Moreover, the highest provincial densities are not necessarily found among the provinces with the largest populations. For example, the highest average density of any province is that of Prince Edward Island (51 persons per sq mile), which has the smallest population and represents an anomaly resulting from its very limited land area rather than from heavy concentrations of population. In contrast, the far more populous province of British Columbia, with its vast mountainous regions and areas of sparse population, has an average density of only six persons per sq mile.

5.2.3 Urban and rural

The urban population was defined in the 1971 Census as all persons living in incorporated cities, towns and villages with a population of 1,000 or over, as well as in unincorporated places of 1,000 or over having a population density of at least 1,000 per sq mile. Also considered as urban were the built-up fringes of these cities, towns and villages if they met the same criteria of population and density. All the remaining population was classified as rural.

Table 5.11 indicates that over three quarters (76.1%) of Canada's population is living in an urban environment, with the degree of urbanization on a provincial basis ranging from 38.3% in Prince Edward Island to 82.4% in Ontario. In comparison with the national average, only two provinces — Ontario and Quebec — were more highly urbanized. The proportion of urban population fell below 50% in just one case — Prince Edward Island.

The rural population, which accounted for 23.9% of the Canadian total in 1971, is further classified in Table 5.11 as either non-farm or farm. The rural farm population is defined for census purposes as those persons living in rural areas on an agricultural holding of one or more acres with sales of agricultural products amounting to \$50 or more in the previous year. Under this definition, the category of rural non-farm in 1971 accounted for 17.3% of the total population, compared to 6.6% for the rural farm segment.

5.3 Demographic and social characteristics

This Section provides data on the general demographic and social characteristics of the population which were available at the end of 1972 from the most recent 1971 Census of Canada. In certain instances, comparisons with earlier census periods are included. Where they are not, such figures can generally be obtained from the relevant reports of previous censuses.

5.3.1 Sex, age and marital status

The age and sex composition represents the most fundamental of the attributes of a given population. Along with marital status, these variables are primarily a function of vital trends: births, deaths, marriages, and dissolutions of marriages. Social and economic factors, by their effects on vital events and migration, influence these characteristics as well. An unbroken series of census data is available as far back as the first Census of Canada in 1871, although only recent trends are summarized here.

Sex ratios. The relatively short demographic history of the Canadian population has been characterized by an excess of males, although this excess has nearly disappeared in recent years. Over the past century the sex ratio (i.e., number of males per 100 females) for Canada reached a peak of 113 in 1911 following a decade of heavy immigration in which males have traditionally predominated. By 1971 the sex ratio had almost evened out at 100.2 which represented only 22,425 more males than females in a total population of over 21.5 million (Table 5.12). In the older settled provinces east of Manitoba the sex ratio has varied between Nova Scotia's 104 in 1911, and Quebec's and Ontario's 1971 ratio of 99. In the western provinces, which were being rapidly settled in the early years of this century, the sex ratio has ranged between Alberta's 1911 high of 149 and Manitoba's 1971 figure of 100.

Age structure. The age composition of the Canadian population is, of course, a reflection of past trends in vital rates and immigration. The lower birth rates of the 1961-71 period compared to those of the 1950s have had a tremendous impact on the population under 15 years of age in 1971. This age group decreased by 211,000 or 3.2% between 1966 and 1971 compared with a gain of 399,800 or 6.4% in the 1961-66 period. As a result the proportion that this age group formed of the total population fell from 34.0% in 1961 to 29.5% in 1971 (Table 5.13).

The population of working age (generally regarded as those 15-64) increased substantially, with a gain in excess of 1,559,000 or 13.1% in the 1966-71 period. This age group comprised 62.3% of the total population in 1971 compared with 59.4% of the total population in 1966 and 58.4% in 1961. Of the total 1961-71 increase in the 15-64 age group, 49.8% of the gain occurred in the 15-24 age group. This young adult age group in 1971 is, of course, the cohort of children born in the high-birth-rate years following World War II. The proportion of persons 65 years of age or over was approximately the same (roughly 8%) in 1971 as in 1961 and 1966.

The latest estimates of the population by age group and sex are shown in Table 5.14 for Canada and the provinces as at June 1, 1972. The method followed in preparing these estimates was much the same as that used in calculating the population estimates described in Section 5.2.1. These estimates are subject to revision when data from the next census in 1976 become available.

Marital status. Analyses of the trends and size of the single, married, widowed and divorced segments of the population assume their most revealing aspects when these categories are observed in relation to their distributions at different age levels and by sex. Table 5.15 shows these three fundamental demographic characteristics in relationship to each other, based on results of the 1971 Census. The figures show, for example, such imbalances as the far greater numbers of single males than single females at the younger age levels and the reverse for widows as compared to widowers in the older age groups. The former condition results from the generally earlier ages of marriage for females, and the latter is due to the longer life expectancy of females as well as the greater tendency for widowers to remarry.

Among the recent trends in the marital status structure is the steady decrease, since 1951, in the number of married females in the child-bearing ages in relation to the total married

women of all ages. This is possibly one of the contributing factors to the sharply declining birth rates in recent years. In 1971, 59.7% of all married females were in the age group 15-44, compared to 61.2% in 1966, 62.9% in 1961, and 64.0% in 1951.

One of the most striking changes revealed by the 1971 Census compared to the previous one in 1966 is the large increase in the number of divorced persons over the 1966-71 period, reflecting in part recent relaxations in the divorce laws. Divorced persons of all ages in 1971 increased to almost three times the size of the 1966 figure (from 64,776 to 175,115). The age group 15-24 experienced the greatest relative increase, but the actual numbers were small compared to most older groups. Moreover, the total number of divorced persons still represented fewer than 1% of Canada's population in 1971. (See also Section 5.8.2.)

5.3.2 Language characteristics

In the 1971 Census, three questions were asked on the languages of the Canadian people. Two of these represented the more traditional census inquiries: one on mother tongue (the language first spoken in childhood and still understood) and the other on official language (the ability to speak English, French, or both languages). These were augmented in 1971 by a third question concerned with the language most often spoken at home. Final figures on official language and the new inquiry on language spoken at home were not available in time for this edition but may be obtained from relevant reports of the 1971 Census. Preliminary data are given in Tables 5.16 and 5.18.

Mother tongue. Summary figures on mother tongue are presented in Table 5.16 which shows the principal languages reported under this concept at the 1971 Census with comparative figures for 1961. It may be noted that the proportion of the Canadian population reporting English mother tongue increased from 58.5% in 1961 to 60.2% in 1971, while the percentage reporting French declined from 28.1 to 26.9. Italian, Greek, Chinese, and Portuguese were others showing significant advances in the ten-year period, while Ukrainian, German, Netherlands, Polish and Yiddish were among the larger groups registering declines.

In addition to providing information on the basic linguistic affiliations of the Canadian people, mother tongue data obtained at decennial censuses form the statistical basis for the creation of Bilingual Districts under the Official Languages Act. For this reason, Table 5.17 is of interest in showing the number and proportion of the population reporting English or French as their mother tongue, by province. The relative gains in English mother tongue over the 1961-71 period occurred mostly in the western provinces at the expense of other mother tongues such as Ukrainian, German and Polish, as the descendants of earlier immigrants now report English as their mother tongue to a greater extent than in previous decades.

Official language. Table 5.18 shows preliminary 1971 Census figures on the population reporting the ability to speak one or both of Canada's two official languages, with comparative data for 1961. This Table indicates that in 1971 a total of 67.1% were able to speak English only, 18.0% French only, and 13.4% were bilingual. These ratios represent a slight increase in the proportion of the population able to speak both English and French over 1961, when the percentage was 12.2.

Language spoken in the home. The new inquiry on language most often spoken at home was introduced in the 1971 Census on the recommendation of the Royal Commission on Bilingualism and Biculturalism and other groups. It adds a new dimension and insight into the languages of Canada since some persons, particularly immigrants, do not use either of the two official languages as the one they speak most often in their homes. Conversely, many others with a non-English mother tongue may no longer employ their mother tongue for this purpose. Preliminary results of the 1971 Census in Table 5.16 indicate that 67.0% of the population spoke English most often in their homes, whereas only 60.2% reported English as their mother tongue.

5.3.3 Ethnicity, religion, birthplace

A population made up of diverse ethnic groups, religious affiliations and countries of birth gives rise to political, social and economic problems quite different in nature from a country with a more homogeneous composition. It is equally true that different backgrounds lend variety and diversity to the national life. Because of the varied nature of Canada's population, the measurements provided by decennial censuses on such subjects as ethnic and religious composition are of widespread interest and in continuous demand. Since the final

1971 Census results were not available in time for this edition, Tables 5.19 to 5.21 show preliminary figures rounded to thousands. Final data for 1971 are available in the relevant census reports, as indicated in the footnotes to the Tables.

Ethnic groups. The ethnic composition of the population of Canada has changed considerably over the years because of many factors, including differences in the flow and source of immigrants. Trends in recent years have been characterized by a gradual decline in the proportions of British Isles groups and a corresponding increase in other European ethnic groups other than French. For example, the former groups had dropped from 57.0% of the total population in 1901 to 44.6% by 1971, whereas other European groups rose from 8.5% to 23.0%. The French ethnic group remained relatively stable, starting at 30.7% in 1901, and moving irregularly lower to 28.7% by 1971. Table 5.19 provides preliminary 1971 figures for the larger ethnic groups in Canada, together with earlier data from the two previous decennial censuses in 1951 and 1961.

Religious denominations. Census figures on religious denominations do not measure church membership or the degree of affiliation with a particular religious body. Respondents were requested to answer the question "What is your religion?" and to enter if possible a specific religious denomination, sect or community. Thus, the census data on this subject relate to the religious denominations to which persons state they belong, adhere or favour, with the opportunity to report "no religion" if so desired. As shown in the preliminary 1971 figures in Table 5.20, three out of every four persons in Canada in 1971 reported one of the three numerically largest denominations — Roman Catholic, United Church or Anglican. Largest relative gains since 1961 occurred in such groups as Jehovah's Witnesses and Pentecostal. None of the major denominations registered actual declines in the 1961-71 period, but the Anglican, Baptist, Lutheran, Presbyterian and United Church groups were among those showing losses relative to the total population.

Country of birth. The proportion of the population born outside Canada has ranged during the present century from a high of 22% throughout the period 1911-31, following the heavy waves of immigration in the early decades, to a low of 15% in 1951 following a period of lower immigration and rising birth rates. Persons born in the United Kingdom comprised over 11% of the population in 1911 and 1921, but this percentage declined gradually to 4.3% by 1971 in the face of the rising proportions of Canadian-born and immigration from other European countries. Persons born in the latter countries rose from 5.6% of Canada's population in 1911 to 7.8% in 1971 (Table 5.21).

5.3.4 The native peoples of Canada

Many centuries before the first European settlers arrived on what is now Canadian soil, this vast country had received immigrants in the prehistoric period. Present-day Eskimos and Indians are the descendants of these early settlers but as a result of heavy immigration by other groups they now represent less than 2% of Canada's population. Administration relating to the affairs of the Indian and Eskimo peoples is described in Chapter 4. Demographic data on their numbers and locations can be obtained from reports of the 1971 Census of Canada, preliminary figures of which indicate a total of 297,000 Indian people and 18,000 Eskimo. The former figure includes both registered Indians (232,000) and non-registered (65,000).

From a later source, there were 257,619 persons registered as Indians by the Department of Indian Affairs and Northern Development as of December 31, 1971. These are persons who are entitled to be so registered in accordance with the terms of the Indian Act. They comprise 560 bands who occupy or have access to some 2,200 reserves having a combined area of about 6.3 million acres. Membership of these bands is distributed among the provinces and territories as shown in Table 5.22. The 29 Indian bands in the Yukon Territory and Northwest Territories are located in 59 settlements that have not been formally designated as reserves. No permanent residents of Newfoundland are registered under the Indian Act.

About two thirds of Canada's roughly 18,000 Eskimos reported in the 1971 Census live in communities in the Northwest Territories, and the remainder mainly in Arctic Quebec (3,800), Labrador (1,000), and Northern Ontario (800). Similar to the rest of Canada the Eskimo birth rate is now declining. In 1971 the rate for the Eskimo population in the Northwest Territories was 38 per 1,000 compared with the Canadian average of 17 per 1,000.

1966-71

5.4 Households and families

This Section relates to some of the basic statistics on households and families collected in the 1971 Census. More detailed information may be found in the 1971 Census reports. Of particular interest will be the reports pertaining to households and families to be published in a series of profile studies of Canada's human resources as part of Volume V of the 1971 Census.

5.4.1 Household size and types

A household, as defined in the census, consists of a person or a group of persons occupying one dwelling. It usually consists of a family with or without lodgers, employees, etc. However, it may consist of a group of unrelated persons, of two or more families sharing a dwelling, or of one person living alone. Every person is a member of some household and the number of households equals the number of occupied dwellings. The statistics presented in this Section pertain to private households only. Collective households such as hotels, motels, institutions of various types (usually considered to contain ten or more unrelated persons) have been excluded because their significant dissimilarities from private households could distort the household picture with respect to size and composition.

The number of private households in Canada increased to 6 million in 1971 from 4.5 million a decade earlier, a gain of almost one third. The corresponding population rate of increase was considerably lower at 18%. This difference in growth rates reflects the marked rise in recent years in the number of households consisting of only one or two persons. Generally speaking, the distribution of households by province in 1971 closely paralleled the population distribution: Ontario had the greatest number of households at 2.2 million, followed by Quebec and British Columbia which had 1.6 million and 668,000 households, respectively.

Households by size. Table 5.23 shows the total number and the average size of households by province for the census years 1961, 1966 and 1971. In the 1971 Census, the average size of Canadian households was 3.5 persons as compared to 3.7 persons in 1966 and 3.9 persons in 1961. In all these censuses, the average number of persons per household was highest in Newfoundland. While the decline in the average size of households during the period 1961-66 was attributable to mainly two provinces, New Brunswick and Quebec, a further drop in the average size during the period 1966-71 was realized in all provinces.

Households containing families. All private-type households are divided for census purposes into two basic categories: family households and non-family households, depending upon whether or not there is a family (or families) present in the household. Table 5.24 shows the distribution of households on this basis for census years 1961, 1966 and 1971.

Family households, although they increased in number from 3.9 million in 1961 to almost 4.4 million in 1966 and to 4.9 million in 1971, proportionately dropped from 86.7% in 1961 to 84.5% in 1966 and to 81.7% in 1971. The proportion of households consisting of two or more families dropped from 3.7% in 1961 to 2.0% in 1971, which is usually an indication of a decrease in the incidence of over-crowding in households. On the other hand, non-family households increased both in number as well as in proportion to the total number of households. This increase is solely attributable to the increase in the proportion of one-person households from 9.3% in 1961 to 11.4% in 1966 and 13.4% in 1971. Thus, new family formation alone was not responsible for the over-all increase in the number of households; some family persons and families who previously shared accommodation with other families now maintained their own households.

Households by age and sex of head. The distribution of household heads by age and sex for the census years 1961, 1966 and 1971 is given in Table 5.25. Of particular interest is the upward trend in households headed by young males of under 25 years of age. Although total households increased by 16.6% between 1966 and 1971, the number of households with heads under 25 years of age grew by 54.0%, reaching 414,470 in 1971 from 269,065 in 1966. By province, this group increased by as much as 72.6% in Manitoba and 63.0% in Newfoundland. Quebec registered the largest growth in the number of households with heads 70 years of age or over, increasing 17.5% to 125,095 in 1971 compared to 106,459 in 1966. Nationally, however, the proportion of households with heads 70 and over declined slightly to 10.3% of all households from 10.7%.

5.4.2 Family size and composition

A family, as defined in the Canadian census, consists of a husband and wife with or without unmarried children, or a parent with one or more unmarried children, living together in the same dwelling. Adopted children and stepchildren have the same status as own children.

The number of families in Canada increased to 5.0 million in 1971 from 4.5 million in 1966 and 4.1 million in 1961, a gain of approximately one fourth over the decade. Following the patterns of provincial population growth, and particularly reflecting the factors of migration, the largest rate of increase in the number of families occurred in British Columbia (35.4% in the 1961-71 period), followed by Alberta (25.0%), and Ontario (24.5%).

Families by size. The total number and average size of families are given in Table 5.26 by provinces for the census years 1961, 1966 and 1971. Although the average size of the Canadian family remained the same at 3.9 persons between 1961 and 1966, it dropped to 3.7 persons between 1966 and 1971 as declines in birth rates across the nation began to be reflected in census family-size trends. Quebec and New Brunswick experienced the largest reductions in average family size, decreasing from 4.2 persons in 1961 to 3.9 in 1971 for Quebec, and from 4.3 to 4.0 for New Brunswick.

Families maintaining own households. Families "maintaining their own households" are those in which the head of the family is also the head of the household. Families not maintaining their own household fall into two census sub-categories: families related to the head of the household, and non-related lodging families. The few who do not fit either of these sub-categories are mostly families of employees living in their employer's household.

As can be seen from Table 5.27, 96.6% of the Canadian families in 1971 maintained their own households. These families increased over earlier censuses both in number as well as in proportion to the total number of families. The majority of the remaining families were related families, characterized by the fact that they were mostly small in size, usually two persons (e.g., the daughter and son-in-law of the household head) and the head of the family was under 25 years of age. On the other hand, lodging families, although increasing slightly in number, constituted a very low proportion of 0.8% unchanged from the 1966 Census.

Husband-wife families. For the analysis of family data, a useful classification is the subdivision into husband-wife families and one-parent families. Table 5.28 shows the distribution of both types of families by age of family head. In the case of one-parent families, the age of head is further classified into male and female heads. In the case of husband-wife families, this type of subdivision is not necessary, since for statistical tabulating purposes, the husband was considered to be the head of the family in 1971 and earlier censuses.

Although between 1966 and 1971 the proportion of husband-wife families dropped slightly, in actual number they increased. They still constituted a predominant proportion (90.6%) of total Canadian families. On the other hand, as can be seen from Table 5.28, the majority of one-parent families were headed by females. During the decade 1961-71, these families increased both in number and proportion from 6.6% in 1961 to 7.4% in 1971. This reflects a slight increase in the incidence of "broken" families in Canada, partially perhaps as a result of recent changes in divorce laws because the proportion of females heading such families increased in the age groups 25-34 and 35-44, and these are the ages in which divorces most frequently take place.

Families by mother tongue of head. Table 5.29 shows the distribution of families by the mother tongue of family head, by province. For census purposes, mother tongue is defined as "the first language learned that is still understood". As expected, the proportion of family heads reporting English, French, or other mother tongue in the 1971 Census showed a similar pattern to that for the population as a whole. For example, 58.5% of the Canadian population reported English as the mother tongue, as compared with 57.2% of all family heads. The corresponding proportions for French mother tongue were 28.1% and 25.6%, with the lower ratio for family heads being the result of the slightly larger average size of French-speaking families. Conversely, other mother tongues were reported by 13.5% of the total population, and by 17.2% of all family heads.

Children in families. There were 8.9 million children in families in 1971. These are limited by definition to children never married and under 25 years of age who were living with their parents or guardians at the time of the census. The above number of children are classified in

Table 5.30 into selected age groups which roughly correspond to pre-school-age children (under six years), those of elementary school age (6-14), those at the secondary school level (15-18), and those of college or working age (19-24).

Declining birth rates are reflected dramatically in the proportionate increases of children in families during the 1966-71 period. The 19-24 age group of children in families increased by 20.7% over the five years, the 15-18 group by 16.7%, the 6-14 group by only 5.9%, while those under six years of age declined by as much as 16.2%. Children in families for all age groups combined advanced in numbers by 11.3% (7.8 million to 8.6 million) in the 1961-66 period, but by only 2.3% (8.6 million to 8.8 million) during 1966-71.

5.5 The vital components of population change

Vital statistics are an important key to the interpretation of population change. They provide a measure of the pace at which the population is increasing by natural means (births minus deaths) and the rate at which women are marrying and reproducing. As such they do much to explain the changing patterns of population growth and composition described in earlier sections of this Chapter. These vital processes of population change are reflected in records of births, deaths, marriages and divorces registered in the provinces and territories of Canada. The continuity of such data gives a constant guide to the planning, operation and evaluation of many national activities, particularly in the fields of public health, education, community planning and various types of business and industrial enterprise.

5.5.1 History of vital statistics

The history of the collection of vital statistics in Canada is described in the *1948-49 Canada Year Book*, pp. 185-188. Most trend tables on this subject in the present edition are for recent years back to 1951. A historical summary of vital statistics data for Canada and the provinces back to 1921 is contained in the Vital Statistics *Preliminary annual report* (Catalogue No. 84-201). Some rough estimates of birth, natural increase, and death rates back to the mid-1800s by ten-year periods are contained in Sections 5.6.1, 5.6.3, and 5.7.1, respectively.

5.5.2 Summary of principal data

Table 5.31 provides a summary of the principal vital statistics by individual years from 1966 to 1971 for Canada, the provinces and territories, with comparative figures by five-year periods back to 1951-55. Table 5.32 shows similar data for urban centres of 50,000 population and over for 1971 with comparative averages for 1966-70 and 1961-65. More detailed information on all aspects of current vital statistics as summarized in these tables, including analyses of recent trends, appear in the annual report *Vital statistics of Canada* (Catalogue No. 84-202), *Causes of death* (Catalogue No. 84-203), and in other regular and special reports. In addition, certain unpublished data are available on request.

5.6 Fertility

Of all the various interactions of the demographic components which produce population change (fertility, mortality, nuptiality, immigration, emigration), none exerts greater influence or is more crucial in its effects than the rate of reproduction or fertility. The nation's death and immigration rates have become far more stable by comparison, and it is the birth and fertility rates that will continue to be the dominant factor in the foreseeable future in shaping the demographic structure of Canada (see Section 5.1).

5.6.1 Births

No accurate figures on Canadian crude birth rates are available prior to 1921, when the annual collection of official national figures was initiated. However, the following rough estimates of the average annual crude rates of live births (i.e., per 1,000 total population) for each ten-year intercensal period between 1851 and 1921 may be inferred from studies of early Canadian census data: 1851-61, 45; 1861-71, 40; 1871-81, 37; 1881-91, 34; 1891-1901, 30; 1901-11, 31; 1911-21, 29.

The general trend in the national crude birth rate since 1930 is shown in the accompanying chart, and that since 1951 in Table 5.31. The annual rates declined gradually but steadily from 29.3 in 1921 to a record low of 20.1 in 1937, recovered sharply in the late 1930s and during World War II to 24.3 in 1945, and following the War rose to a high of 28.9 in 1947. Between 1948 and 1959, the rate remained remarkably stable at between 27.1 and 28.5. Between 1966 and 1970 the rate levelled off somewhat between 19.4 and 17.5 but declined to an all-time

Vital statistics rates, 1930-71

1. Deaths under one year of age.
2. Deaths within the first four weeks of birth.

record low of 16.8 in 1971. Part of this decline is attributable to the fact that the crude birth rate is based on total population, which now includes larger proportions of "non-reproductive" population. Even if the annual number of births were to remain stable, the net effect of an increase in population would be a declining crude birth rate.

The rates in most provinces followed trends very similar to the national trend but showed some regional differences in recent years. Although all provinces had record high rates immediately following World War II, during the 1951-55 period average birth rates in Ontario and the western provinces were higher than during 1946-50 and those for Quebec and the Maritime Provinces were lower. In fact, Ontario, Alberta and British Columbia had record high crude birth rates during the 1956-60 period. In 1971, Quebec, Ontario, Saskatchewan, Alberta and British Columbia had record low rates.

It is often erroneously assumed that Quebec has not only the largest number of births annually but the highest rate in Canada. Since the late 1930s or early 1940s Newfoundland, in some years New Brunswick and, since 1953, Alberta have had higher birth rates than Quebec. Table 5.31 shows that six provinces — Newfoundland, Alberta, New Brunswick, Prince Edward Island, Nova Scotia and Saskatchewan, in that order — had higher crude rates than Quebec or Ontario in 1966, followed by Manitoba and British Columbia, and that, since 1968, Quebec has had the lowest crude birth rate in the country. However, since these crude rates are based on the total population they do not reflect the true fertility of the women of reproductive ages in the different provinces or the number married within these reproductive ages. A more

accurate measure of the true birth rate is one based on the number of women between the ages of 15 and 45 (see Table 5.41 and Section 5.6.2).

Also contrary to popular impression, since 1953 more babies were born each year in Ontario than in Quebec; for example, in 1971, 130,395 babies were born to Ontario mothers as compared with 89,210 to Quebec mothers. Altogether, 362,187 children were born alive in Canada in 1971, 117,088 or 25% fewer than the record 479,275 born in 1959. Despite an increase since 1966 in the number of women of reproductive age and the annual number of marriages, the number of births has fluctuated between 388,000 and 362,000 during this period.

Sex of live births. With rare exceptions, wherever birth statistics have been collected they have shown an excess of male over female births. No conclusive explanation of this excess has yet been given. Nevertheless, it is so much an accepted statistical fact that a proper ratio of male to female births has become one of the criteria of complete registration. The number of males to every 1,000 females born in Canada has averaged around 1,057 since the middle 1930s. Provincial sex ratios vary much more widely because of the relatively small number of births involved — the smaller the total number of births, the greater the chance of wide sex-ratio variations from year to year. In 1971, 1,063 male infants were born for every 1,000 females.

Hospitalized births. In 1971, 99.6% of all Canadian births occurred in hospital as compared with 96.9% ten years previously, and 79.1% twenty years ago. Before the initiation in 1958 of the federal-provincial hospital insurance programs — in which all provinces were participating by 1961 — there were rather wide variations among the provinces in percentages of hospitalized births. Such variations were caused by the existence of prepaid or provincially sponsored hospital, maternity or medical care plans in some provinces, the unavailability of hospital facilities in others — particularly in remote rural areas — and preference for home delivery in some local areas. Little variation now exists and Table 5.33 shows that only in the Yukon Territory and Northwest Territories do the percentages fall below 90.0%; in the Yukon Territory it was 86.0% in 1971, and in the Northwest Territories 88.6%.

Illegitimacy. In 1971 9.0% of the live births in Canada were “illegitimate” (i.e., births in which the parents reported themselves as not being married to each other at the time of the child's birth or registration, and in Ontario to those in which the mother was reported as “single”). This percentage is low compared with that of many countries of the world but has been rising recently, as shown in Table 5.34. In some provinces the percentages of illegitimate births have more than doubled during the past 20 years. It should be noted that the increase in the proportion of the illegitimate births is attributable to two factors: first, the relative increase in the proportion of women aged 15-24 (the female population of child-bearing age where the probability of having an illegitimate birth is the highest); and second, since legitimate fertility has declined sharply in recent years, the relative weight of the illegitimate fertility has increased.

Multiple births. Approximately 1% of confinements result in multiple births, and 99% of the multiple births are twins. One out of about 10,000 confinements results in triplets. Two sets of quadruplets were born in 1960 and one set in each of 1962, 1963, 1964 and 1968 and two sets in 1969.

Age of parents. Age of parents is an important variable in any analysis of birth statistics. The distribution of legitimate and illegitimate infants born in 1971 by age of the parents is given in Table 5.35. This Table shows that over two thirds of the births in 1971 to married mothers were among 20-29-year-olds, another 15% to 30-34-year-olds and about 8% under 20. Almost 46% of the illegitimate births were to unmarried mothers under 20 and an additional 34% among 20-24-year-olds.

It should be kept in mind that the higher proportion of births occurring at younger ages in recent years does not necessarily mean that couples are having their children at a younger age. Two things should be noted: first, the decline in fertility in recent years has been greatest among older women and, consequently, births occurring at younger ages automatically form a greater proportion of total births than formerly, as well as produce a lower average age at birth; secondly, this effect is compounded by the growing proportion of women in early child-bearing ages where fertility is higher or, more accurately, has declined less than among older women.

Order of birth. Table 5.36 shows the order of birth of all live-born infants in 1971 according to the age of the mother. As would be expected, 33,546, or four out of every five of the 40,480 infants born to mothers under 20 years of age, were the first live-born child, whereas about half of the children born to mothers of 20-24 years were their second or later live-born child. In 1971, 292 infants were born to mothers who had not yet reached their 15th birthday.

Table 5.37 summarizes the pattern of family formation since 1951 and shows that the percentages of first and second children have been increasing in recent years. As mentioned in the preceding Sections for illegitimate births and average age of parents, the decline in fertility and the recent evolution of the age structure of the female population affect the percentage distribution of births by parity. The increasing proportion of women in early child-bearing ages, where the majority of low-parity births occur, tends to increase the proportion of these births. Also, as explained for illegitimate births, the decline in the number of high-parity births also contributes to the increase in the percentage of low-parity births since the latter are taken as a percentage of total births.

Birthweight. Excluding Newfoundland, information on birthweight of newborn infants has recently become available from provincial records of birth. These data, in addition to their usefulness in calculating the average weights of newborn infants, are of importance from the public health and medical points of view in throwing light on the number of immaturely developed foetuses that are delivered alive. According to criteria recommended by the World Health Organization, infants of 5½ lb. or less at birth are considered "immature" and hence exposed to a much greater risk of dying than those over this weight.

Weights of infants at birth depend on a host of maternal factors — biological, physiological, environmental, nutritional, etc. — information on which is not available from the birth records. However, some information is available from Statistics Canada on the age of the mother and duration of pregnancy before delivery. Analysis of this information shows that there are variations in average weight according to the age of the mother; women under 20 and over 35 tend to produce higher proportions of immature infants, so that the late 20s and early 30s would appear to be the ideal ages for motherhood; and almost all infants of less than 28 weeks gestation are delivered "immature" according to the definition. The average single male infant born at full term weighs about 7 lb. 6 oz. at birth and the average female about 5 oz. less.

Stillbirths. The 3,396 stillbirths of at least 28 weeks gestation that were delivered in 1971 represented a ratio of a little over nine for every 1,000 foetuses born alive. As is evident from Table 5.38, the stillbirth ratio has been decreasing steadily, except for a slight increase in 1967, and has been cut by more than half over the past quarter-century. Although the variations between provincial ratios have never been wide, ratios in some provinces have been reduced more than in others. The stillbirth ratio among unmarried mothers has been consistently higher than that among married mothers but the difference is narrowing.

Table 5.39 illustrates the fact that the risk of having a stillborn child increases with the age of the mother. Although stillbirth ratios for mothers of all ages have been declining, they continue to be three to four times as high for mothers over 40 years of age as for mothers under 30.

The causes of death for the stillbirths delivered in 1971 are shown in Table 5.40. Of the 3,396 stillbirths, in 1,335 cases, or in about four out of every ten, the premature death of the foetus (before delivery) was medically certified as having been due to some abnormal condition of the placenta or the umbilical cord; in 1,482, or approximately 43%, death was due to injury during delivery or to some abnormal condition or infection in the foetus itself, and in the remainder (579) to some abnormal condition or infection in the mother.

5.6.2 Fertility rates

The sex and age composition of a population is obviously an important factor affecting crude birth rates. Since almost all children born each year are to women between the ages of 15 and 45, variations in the proportion of women of these ages to the total population will cause variations in the crude birth rate of different countries, or of different regions within a country, even though the actual rates of reproduction or fertility of the women in these age groups in each country or region are identical. It is therefore conventional practice to calculate what are termed age-specific fertility rates, i.e., the number of infants born annually to every 1,000 women in each of the reproductive age periods.

Table 5.41 indicates that in 1971, considering all women whether married or not, women in their 20s were the most reproductive, as might be expected; on the average, for every 1,000 women between the ages of 20 and 25, 135 infants were born during that year or, expressed another way, about one woman out of seven in that age group gave birth to a live-born infant. For the third consecutive year, women in the age group 25-29 had a higher rate (142) than those in their early 20s.

Another measure of fertility in a country is obtainable from what is conventionally referred to as a gross reproduction rate. The gross reproduction rates shown in Table 5.41 indicate the average number of female children born each year to each woman living through the child-bearing ages. In other words, the gross reproduction rate represents the average number of females that would be born to each woman who lived to age 50 if the fertility rate of the given year remained unchanged during the whole of her child-bearing period. A rate of 1.000 indicates that, on the basis of current fertility and without making any allowance for mortality among mothers during their child-bearing years, the present generation of child-bearing women would exactly maintain itself.

Canada has always had one of the highest gross reproduction rates among the industrialized countries of the world. Even during the period of low birth rates in the 1930s the rate varied between 1.300 and 1.500 and since World War II has ranged from 1.640 to a record high of 1.915 in 1959. However, since 1959, and particularly since 1964, the national gross reproduction rate has dropped rather dramatically from 1.788 to 1.061 in 1971 — slightly above the number required for the population to replace itself. Provincial and territorial rates have, on the whole but with some exceptions, followed the same pattern as the national average. Among the provinces, Quebec, British Columbia and Ontario, in that order, had the lowest gross reproduction rates in 1971, with Quebec below the replacement level.

5.6.3 Natural increase

The excess of births over deaths, commonly referred to as “natural increase”, is a very important factor in the growth of a population. Although the collection of Canadian birth and death statistics began only in 1921, some idea of the rate of natural increase in the early years back to the mid-1800s may be learned from the estimates of births and deaths shown at the beginning of Sections 5.6.1 and 5.7.1, which result in the following natural increase rates (per 1,000 population): 1851-61, 23; 1861-71, 19; 1871-81, 18; 1881-91, 16; 1891-1901, 14; 1901-11, 18; 1911-21, 16.

The estimates of natural increase in the late 1800s and early 1900s reflect a combination of high birth rates and declining death rates. During the 1920s and early 1930s the birth rate declined more than the death rate and the natural increase rate dropped to a record low of 9.7 in 1937. But higher birth rates during and after World War II and a continued declining death rate caused the natural increase rate to rise steadily from 10.9 in 1939 to a record 20.3 in 1954. After that year there was a steady drop because of declining birth rates and the natural increase rate fell for the first time below ten in 1971 at 9.5. Table 5.31 gives average rates of natural increase in the provinces for five-year periods 1951-65 and for single years 1966-71.

5.7 Mortality

The death rate in Canada is one of the lowest in the world (7.3 per 1,000 population in 1971). After a continuous gradual decline over the past hundred years or more, the rate appears now to have almost levelled off. It seems that Canada, like other industrialized nations, has virtually completed the demographic transition in the mortality component of population change. Any further reduction in the death rate is likely to be very small, and to affect primarily persons in the older ages. Canadian mortality experience in general, as well as in relation to infant and maternal deaths, is discussed in this Section, followed by measurements of life expectancy compiled from recent death rates.

5.7.1 General mortality

No official crude death rates (i.e., rates per 1,000 total population) are available prior to 1921. However, some indication of these may be obtained from studies of the early censuses which have resulted in the following estimates of annual crude death rates for specified intercensal periods: 1851-61, 22; 1861-71, 21; 1871-81, 19; 1881-91, 18; 1891-1901, 16; 1901-11, 13; 1911-21, 13.

As is typical of pioneer populations, Canada had high death rates in the mid-1800s when the country was still in the throes of settlement. The crude death rate during that period is estimated as between 22 and 25. Although no data are available, it is assumed that, while mortality at all ages was high, the rate among infants, children and young adults must have been particularly high since even in the 1920s mortality in these ages was still quite high. With the gradual increase in population density, urbanization and improved sanitation and medical services, the crude rate was halved during the 80 years between 1851 and 1930, dropping from about 22 to 11. It declined steadily to slightly over 8 in the late 1950s and dropped to record lows of 7.3 in 1970 and 1971.

Table 5.31 shows the trends in crude death rates since 1951 in the provinces and territories. The low rates shown for Newfoundland and Quebec are attributable mainly to the large proportion of young people in their populations and the relatively high rates for British Columbia to the high proportion of elderly people in that province.

Table 5.32 shows the numbers of deaths in urban centres of 50,000 population and over in 1971, and the average deaths per year for the periods 1966-70 and 1961-65.

Age and sex distribution of deaths. During the period of national vital statistics (1921 to date) the mortality pattern at all ages has been downward. Of major significance in lowering the over-all death rate were the reductions in infant mortality, in childhood death rates and in those of young adults.

Table 5.42 shows that, in the 20 years between 1951 and 1971, mortality rates among infants (under one year of age) and for children 1-4 years of age dropped by more than one half. Rates for older children and young adults also declined steeply. Despite the reduction in infant mortality, more deaths still occur in the first year of life than in any other single year of age. As shown in Table 5.43 males under age 40 accounted for 18.1% of all male deaths in 1961 but for only 13.6% of such deaths in 1971; in 1961, 16.4% of all female deaths were of persons under age 40, a percentage that declined to 10.7 in 1971. Percentage reductions in the mortality of older males since 1951 were more moderate, and over the 55-69 range they were quite small; the corresponding reductions for older females, however, were very substantial in every age group up to 85.

The sharp declines in mortality in the age groups under 40 has tended to increase the population in the older groups and to raise the average age at death. Over the 1961-71 period, the average age at death among males rose from 59.7 to 63.3 and the average age for females increased still more markedly, from 63.1 to 68.2. Over the same period, the male median age at death rose only 0.6 year, from 67.9 to 68.5 and the gain for females was 2.5 years, from 72.2 to 74.7. This means that half of the females who died during 1971 were more than 74.7 years old.

There are variations from province to province in average and median ages at death; these, in turn, are dependent in large measure on the age distribution of the population as well as on varying mortality rates at each age. For example, in Newfoundland a high mortality rate among infants and young children reduces the average and median age for that province, but the reverse is the case in British Columbia and several other provinces with older populations.

Causes of death. Table 5.44 summarizes the most recent figures for deaths and death rates in Canada, grouped according to the International Abbreviated List of 50 Causes of the International Classification of Diseases. Over 71,500, or 46% of the 157,272 deaths occurring in 1971 were due to diseases of the heart and circulatory system; 31,036 (almost 20%) to cancer; 12,031 (over 7%) to accidents; 8,986 to the major respiratory diseases (other than lung cancer); and 5,266 to diseases associated with early infancy. Combined, these accounted for almost 129,000 or almost 82% of all deaths during the year. Because of the rise in the average age at death during the past 30 years, the proportions of deaths from causes that affect older people have increased. Cancer and diseases of the cardiovascular-renal systems now account for a larger proportion of all deaths than formerly. By the same token, deaths from causes that affect mainly infants, children and young adults have declined.

Table 5.45 shows that accidents are, by far, the leading cause of death among males from age one to 44 and one of the five major causes above that age; although less predominant among females, accidents are also one of the leading causes of female death beyond the first year of life. Similarly, cancer is among the major causes of death among both males and females at all ages beyond infancy, while cardiovascular diseases are, on the whole, the major cause of death beyond age 45 among both males and females.

5.7.2 Infant mortality

Table 5.46 shows the striking improvement that has taken place in the mortality rates among infants (under one year of age) during the past 20 years. Both male and female rates have been more than halved during this period. For example, if the 1951 death rate had applied in 1971 there would have been 13,944 infant deaths instead of the 6,356 actually recorded, or an actual saving of 7,588 lives. This improvement is attributable to many factors — the higher proportion of births taking place in hospital or under proper prenatal and postnatal care, better supervision of water supplies, improved sanitation, pasteurization of milk, the use of antibiotics, improved home environment as a result of higher living standards and, in recent years, the generally lower age of mothers.

The variations that exist in infant mortality rates from province to province and from one locality to another may be explained by differences in the extent to which these factors apply provincially or locally. Among the provinces, the 1971 male infant mortality rates ranged from a record low of 17.1 to a high of 26.3, compared with the national average of 19.9, the latter including the high rate among the Northwest Territories aboriginal population. Female rates ranged from 13.3 (also a record low) to 19.4, compared with the national rate of 15.1. Although the national and provincial rates for both sexes had been declining steadily for some years, and despite, for some unknown reason, some reversals in provincial rates during 1968, the 1971 rates have declined to new record lows in most provinces.

Table 5.46 shows that mortality among male infants is roughly 20-25% higher than that among female infants for Canada, with wider variations for the individual provinces. For the country as a whole, out of every 1,000 infant boys born alive in 1969, 22 died before reaching their first birthday, whereas out of every 1,000 infant girls born alive, 17 died within one year. As already pointed out, there are on the average 1,055 males born to every 1,000 females but, because male infant mortality is higher, the excess of males is reduced greatly by the end of the first year. For example, in 1964-69 there were 1,213,833 male children born compared with 1,150,240 female children, an excess of 63,593 or 5.5%; in the same period, 30,240 male children died during their first year compared with 22,634 female children so that the excess of males at one year of age was reduced to 55,987 or 4.9%.

Causes of infant deaths. Infant mortality by cause of death is shown in Table 5.47. For example, of the 6,356 infants dying during 1971 before reaching their first birthday, 3,295 — or 52 out of every 100 — died of conditions usually associated with very early infancy or delivery. Of these, 1,356 died of anoxia or hypoxia (absence or deficiency of oxygen); 708 were due to immaturity of the foetus; 575 to some disease or condition in the mother, difficult labour or other complication of pregnancy or delivery; and 332 to some condition in the placenta or umbilical cord. Congenital malformations accounted for an additional 1,334 deaths. Of the 685 deaths from respiratory diseases, 514 were due to pneumonia. Of the 344 accidental deaths, 254 were due to suffocation by food or other objects. Of the 167 deaths from infective and parasitic diseases, 80 were due to dysentery, enteritis and diarrheal diseases.

Ages of infant deaths. As indicated in Table 5.48, of the 6,356 infants who died in 1971 within a year of their birth, 4,485, or 70% were less than four weeks old — conventionally referred to as the “neonatal period”. Of these neonatal deaths, 3,956 (or almost nine out of every ten) died within one week of their birth, of this number 2,644 died within 24 hours of delivery.

It has been stated that deaths occurring within the first four weeks following birth are conventionally referred to as “neonatal” deaths. As would be expected, deaths occurring in this hazardous neonatal period during 1971 were caused mainly by conditions associated with pregnancy, delivery or congenital malformations.

As in the case of total infant deaths, the neonatal death rate dropped from 22.6 in 1951 to 12.4 in 1971, with corresponding improvements in all provinces. Variations in provincial rates are narrowing, the 1971 rates ranging from 10.9 to 17.6. However, as the rate approaches a “hard-core” level, improvements during the past decade have not been as dramatic as they were during the previous two decades.

Perinatal mortality refers to the combined total of stillbirths and deaths of live-born infants occurring “around” the natal period and is a relatively new vital statistics concept. Since such deaths frequently have the same underlying causes associated with pregnancy or delivery (regardless of whether they occur before or after delivery) they are generally considered as including the combined total of stillbirths occurring after at least 28 weeks

pregnancy and deaths of live-born infants who fail to survive the first week of life.

Table 5.46 shows that in 1971 there were 7,352 such "deaths", of which 3,396 were stillborn and 3,956 live-born but failed to survive one week. The national rate of such deaths was 20.1 for every 1,000 total deliveries, a drop from 35.8 in 1951. This perinatal rate has declined slowly but steadily from 65.2 in 1921.

5.7.3 Life expectancy

Life tables are measures of life expectancy compiled from the death rates prevailing over a period. They assume that a given cohort of people (usually 100,000) are born simultaneously in a particular year and continue to be subject all their lives to the death rates prevailing in that year, or perhaps to the average death rates for, say, a three-year period centred around that year. The "expected" deaths in the cohort are calculated (in the case of a "complete" life table) for the first year of life, second year of life, etc., and the diminishing cohort is "followed" for 100 or more years until it has been virtually eliminated. Life expectancy at birth is calculated for the entire cohort and, subsequently, remaining life expectancy is calculated for the survivors at one year, two years, etc. It should be realized that the assumptions of such a life table are never fulfilled in practice and that the hypothetical cohorts in life tables do not represent any actual population. Usually, the persons in an actual cohort born in the life-table year will have a higher life expectancy than those in the life-table cohort because, during their lifetimes, public health conditions will presumably constantly improve and standards of medical care will also presumably advance.

Six official series of life tables for Canada and the provinces and regions have been published to date, based on deaths in the three-year period around each of the Censuses of 1931, 1941, 1951, 1956, 1961 and 1966. The life-table values for 1966 are given for selected years of age in Table 5.49. This Table shows that, at 1965-67 mortality rates, 2,525 of 100,000 males born would have died in their first year with 97,475 surviving to one year of age, that 156 more would have died in their second year with 97,319 reaching their second birthday, and so on. There would be 252 survivors at 100 years of age. The "Probability of dying" column shows the ratio between the population at each age and the number of "expected" deaths in the coming year. Finally, as already stated, the "Expectation of life" column shows the number of remaining years of life that can be expected at each age, given the 1965-67 mortality rates.

Table 5.49 also shows that the male probabilities of dying were higher than the corresponding female probabilities over the entire period from birth to 90 years. Mortality rates, and consequently the probabilities of dying, were lowest at about age ten for both sexes. Above this age the male probability rose quite rapidly, reflecting male accident mortality, and the female probability rose more gradually. Mortality for men between ages 20 and 35 was fairly constant but the male probability began to rise steeply at age 40, due mainly to cardiovascular mortality. Female probabilities after this age rose steadily but less rapidly. It may be observed that about 11,700 males would have died by age 50 as compared with 7,100 females, and that about 57,500 males would have survived to age 70 as compared with 74,400 females.

Table 5.50 shows life expectancy values over the 1951-66 period. By 1966, Canadian life expectancy at birth had reached a new high point of almost 68.8 years for males and 75.2 years for females — comparable to the expectancies for other countries with highly developed programs of medical and public health care. Because of the still substantial level of infant mortality, the expectations for male and female children one year old were somewhat higher than the corresponding expectancies at birth. Expectation at age 20 was 51.5 years for men and 57.4 years for women and, at age 40, 33.0 years for men and 38.2 for women. By age 65, the remaining expectancies were 13.6 years for men and 16.7 years for women.

Table 5.51 shows the life expectancies for five Canadian regions for selected years over the period 1951-61, and the corresponding expectancies for all ten provinces for 1966. The steady widening of the gap between male and female expectancies, so evident at the national level, was common to the expectancies for all five regions. Throughout the 1951-61 period, the Prairie Provinces showed the highest male expectancies and, in the later years, the highest female expectancies as well. The Quebec expectancies were consistently the lowest but they showed the largest gains over the period. Between 1931 and 1961, Quebec life expectancies at birth rose by 11.1 years for males and 15.0 years for females, as compared with the national advances of 8.4 years for males and 12.1 years for females.

In 1966, for the first time, expectancies were calculated for all ten provinces. Male expectancies at birth ranged from 70.5 for Saskatchewan to 67.9 for Quebec, a difference of 2.6 years; Saskatchewan also had the highest expectancies for females at 76.5 years and Quebec the lowest at 73.9 years. In general terms, it may be stated that 1966 expectancies for all four western provinces, at all the selected ages, were moderately above the national average, with the Saskatchewan rates being the highest in all cases. Ontario rates were fairly close to the Canadian average, except those for older men which were slightly below it. Quebec rates were still the lowest in the country, rather less than a year below the national average for males from birth to age 40 and somewhat more than a year below the national average for the corresponding range for females. For the Atlantic Provinces, expectancies at birth and at one year of age clustered fairly closely around the Canadian average, although the Newfoundland female expectancy at birth was a little lower. This statement also applies to expectancies at age 20, with Newfoundland males slightly above the national level. For older males, most Atlantic region expectancies were a little above average and for older females they fluctuated around the national figure.

5.8 Nuptiality

This Section includes not only recent statistics on marriages and marriage rates, but also on dissolutions of marriages. There is expanded coverage of the latter subject in this edition because of the dramatic increases in the number of divorces resulting from recent changes in Canada's divorce laws.

5.8.1 Marriages

In 1971 a record 191,324 marriages were solemnized in Canada, mainly because of the relative increase in the numbers of men and women in the prime marrying ages — the late teens and the early 20s. This growing proportion of young men and women has advanced the crude marriage rate from a low of 6.9 per 1,000 population in 1963 to 8.9 in 1971. Table 5.52 gives the number of marriages and the marriage rates for Canada and the provinces for the four census years 1951, 1961, 1966 and 1971, with percentages of brides and bridegrooms according to place of birth.

For the country as a whole, 81% of the bridegrooms of 1971 were born in Canada, 67% in the province in which they were married; 86% of the brides were born in Canada, 73% in the province in which they were married. There are wide variations in the pattern of intermarriage of foreign-born and native-born persons among the provinces; in the older Atlantic Provinces and in Quebec and Saskatchewan, there is a greater tendency than in the other provinces to marry native Canadians and in these areas both partners are often born in the same province. In Ontario, Alberta and British Columbia there are higher proportions than elsewhere of intermarriage with persons born in other provinces or outside Canada.

Age and marital status. Table 5.53 shows that 169,072 or over 88% of the 191,324 brides who married in 1971, and 88% of the grooms, had never previously married. The proportion of divorced brides remarrying in 1969 rose sharply for the first time to 6.4% from 4.4% in the previous year and the proportion of divorced grooms from 4.7% to 6.9%. By 1971 these proportions had risen to 7.5 and 8.1, respectively, resulting from the increased number of divorces granted under the new federal divorce legislation enacted in 1968.

In 1971, the median age at marriage — the age above and below which half of the marriages occurred — was 23.5 for bachelors and 21.3 for spinsters. After having remained constant since 1960 at 21.1 and 21.2, the 1971 median ages represent a slight trend toward later marriage, particularly for bachelors.

Religious denomination. The distribution of brides and bridegrooms by religious denomination is roughly the same as that for the population as a whole. Table 5.54 shows the relatively strong influence that religion has on marriage. About 63% of all marriages are between persons of the same religious denomination; in 1971 among those of Jewish faith it was about 90%; among Roman Catholics about 80%; Eastern Orthodox about 64%; and United Church about 50%. Except for those of the Jewish faith, the proportions of persons of the same faith marrying appears to be declining slightly in recent years.

5.8.2 Divorces

Since 1921, the number of divorces granted each year in Canada has been rising steadily. From only about 500 during the 1921-25 period, the annual number of divorces rose to more

than 1,000 in 1931-35, to about 2,500 in 1941, and to 5,270 in 1951. From 1952 to 1962 the annual increase was slight, as the number of divorces in the latter year did not exceed 6,800. However, after 1963 the increase was particularly large, and in the five years to 1968 the number of divorces rose from 7,686 to 11,343.

Relating the number of divorces in one year to the total number of married women in the population produces a slightly different picture. The number of divorces per 100,000 married women rose from 33 in 1921 to 52 in 1931 to 105 in 1941 and to 173 in 1951, stabilizing at that point and even decreasing slightly to 166 in 1962. Since then, the increase has been sharp and the number of divorces per 100,000 married women reached 185 in 1963 and 248 in 1968.

A more refined analysis can be produced by relating the divorces of a given year to the cohorts of marriage from which they originated. This permits the calculation, for a given year, of the proportion of marriages which would eventually end in divorce if the conditions existing during that year were to remain constant indefinitely. Such an analysis gives a trend of the probability of divorce almost identical to that obtained by relating the annual number of divorces to the number of married women. About one marriage in 100 would have been dissolved by divorce if the conditions of 1921 had remained constant. This probability rose to between 1 and 2 in 1931, to between 3 and 4 in 1941 and to 5 in 1951, staying at that level until 1962. The advance since that time has been sharp and figures for 1968 indicate a divorce probability of about 8 per 100 marriages or about one marriage in 12 that will eventually end in divorce. This last increase is probably related to the high proportion of early marriages during the postwar period. In other words, the probability of divorce would in all likelihood have been lower in 1968 had the average age at the time of marriage not gone down during that period.

Legislation in effect since 1968 has led to a considerable increase in the number of divorces. From the figure of 11,343 in 1968, the number of divorces rose to 26,093 in 1969, 29,775 in 1970 and 29,626 in 1971 (Table 5.55). The very small proportion of rejected petitions confirms the irreversibility of marriage breakdown, and the role of the courts in this instance seems limited to legalizing an already existing state. On the basis of the number of divorce decrees handed down, the probability rate of divorce in 1969 would be 20%, and that of 1971, 23%, or nearly one marriage in four that would eventually be dissolved by divorce. These figures very likely over-estimate the long-term trend since a disproportionate number of divorces were granted to couples married for more than 20 or even 30 years and who were probably unable to obtain a divorce under previously existing legislation. However, it is impossible to estimate the proportion by which these divorces exceed the norm and it may be necessary to wait several years before making a judgement on the long-term probability of divorce. Such a rate would in all likelihood be higher than the 1968 rate, but comparisons are not valid over time since the frequency of divorce depends on both the degree of stability of a marriage and the nature of the legislation in effect.

Although it is still too early to talk about stabilization because the legacy of pre-1968 conditions still influences the annual number of divorces, an analysis of the characteristics of divorced couples offers some opportunity to gain information on certain aspects of divorce that are still unknown and which are, moreover, less affected by legislation. Such an analysis would be mainly demographic. In addition, it would concern itself only with divorces granted under the new legislation, that is 21,964 in 1969, 29,168 in 1970 and 29,605 in 1971.

Grounds for divorce. Prior to 1968, adultery was, with very rare exceptions, the only grounds for divorce. The new legislation provided 16 justifiable grounds for divorce: adultery, sodomy, bestiality, rape, homosexual act, subsequent marriage, physical cruelty, mental cruelty, imprisonment for aggregate period of not less than three years, imprisonment for not less than two years on sentence of death or sentence of ten years or more, addiction to alcohol, addiction to narcotics, whereabouts of spouse unknown, non-consummation, separation for not less than three years and desertion by petitioner for not less than five years. One or more grounds may be cited in any petition, but in such cases it may be sufficient to establish proof of only one of those named to obtain a divorce. In almost three quarters of the petitions filed only one is mentioned. Most frequent, in descending order, are: separation, adultery and desertion. The reasons given most frequently when multiple grounds appear in the divorce petition are physical and mental cruelty, adultery and cruelty, and adultery and separation. Table 5.56 shows that for divorces as a whole, the proportion of cases involving adultery has risen from

29% in 1969 to 34% in 1970 and 38% in 1971. Separation was cited in 57% of cases in 1969, 51% in 1970 and in about 47% in 1971. Desertion is given as the reason for divorce in a steadily decreasing proportion of cases. On the other hand, there has been a sharp increase in the number of divorces because of cruelty.

The relative frequency of grounds for divorce varies with the petitioner. Adultery or separation are listed more frequently when the husband is the petitioner. On the other hand, women more frequently petition for divorce on grounds of cruelty or alcoholism.

Ages of divorced persons. The most striking finding, as shown in Table 5.57, relates to the sharp drop in the average age of persons being divorced. Men over 40 accounted for more than 50% of divorces in 1969, but this proportion dropped to 43% in 1971. The trend is the same for women, where the proportions were 43% and 34%, respectively. The average age of men being divorced (which was 42 in 1969), was only 40 in 1970 and just over 39 in 1971. For women, the average age went from 39 in 1969 to just over 36 in 1971.

Legislative changes are at the root of this decrease in age. Marriages dissolved first were usually those which took place 20 or 30 years earlier and which could not be dissolved under previous legislation. This distorting effect will gradually level off but it is by no means certain that it has yet completely disappeared. Consequently, increasingly earlier age at divorce cannot be validly assumed.

Although there has been rapid change in the average age at the time of divorce, the gap in the average age between divorced persons has remained remarkably constant. It is generally the same as the average age-gap at the time of marriage. This does not necessarily mean that the average age-gap at the time of marriage has no influence on divorce. When people marry young, the average age-gap is slight but it is precisely this group of marriages that is most divorce-prone, and there is some reason to expect that there would be a lesser average age-gap at divorce. This is offset by a higher frequency of divorce in cases where there is a wide average age-gap between partners in the marriage.

The average age-gap between petitioners is very wide. The average age of husbands requesting a divorce is considerably higher than that of all husbands. The grounds given for divorce offer a possible explanation. Husbands petition for divorce more frequently on grounds of separation or desertion where there is a waiting period of three or five years before an action can be filed.

Number of children. Referred to here are children living with the parents at the time of the divorce and not all children born of the marriage. Included are all children of 16 years and younger as well as still-dependent children over 16. The total number of children involved was 20,099 in 1969, 32,417 in 1970 and 34,526 in 1971, or 0.92 children per divorce in 1969, 1.11 in 1970 and 1.17 in 1971 (Table 5.56). The change in number of children per divorce is closely related to the average age of parents at the time of divorce. The higher the average age of parents, as was the case in 1969 for example, the lower the probability of there being children at home. However, given the same age at divorce, the average number of children born of divorced parents is lower than the average for all families.

Nearly 55% of divorced persons in 1969 had no children at the time of the divorce. In 1970, this proportion was 47% and in 1971, 45%. The high proportion of divorces not involving children in 1969 relates to their higher average age. Divorced couples without children include not only those married for 20 or 25 years where the children have reached the age of majority and are no longer living with their parents, but also recently married couples where the proportion without children is very high. Almost half of all couples divorced after five years of marriage were still childless as against less than 20% for the total population married for the same length of time. Among couples divorced after ten years of marriage, the proportion without children was 25% as against almost 10% for the population as a whole. Among divorced couples with children, more than 70% had one or two children only; couples having three children made up most of the remainder.

Custody of children. Wives petition for divorce more often than do their husbands; they do so more often when they have children, and more frequently still as the number of children involved increases. The wife files for divorce in a little over 63% of all cases, and this proportion has remained the same over the three-year period studied. However, in cases where children are involved, women request the divorce in nearly 70% of the cases and this

proportion increases with the number of children, reaching 75% in families of seven children or more.

The mother is granted custody of all the children in almost 75% of all cases and fathers in about 13%. In virtually all the remaining cases, custody is either divided or not awarded.

These proportions vary with the petitioner. As shown in Table 5.56, when the mother is the petitioner she is granted custody in almost 90% of the cases while the father gains custody in only 2% to 3%. In the remaining cases, custody is divided or not awarded.

On the other hand, the proportion of cases in which the father gains custody when he is the petitioner has dropped from 43% in 1968 to 38% in 1971. The proportions are 34% and 38%, respectively, for custody awarded to the mother. The custody of the children is divided in 5% of the cases, and in approximately 20% of the cases no award as to custody is made.

The high proportion of cases where no custody award is made when the father petitions for the divorce is probably related to the higher average age of fathers at the time of divorce. The higher the average age at the time of divorce, the lower the probability of there being minor children for whom an award is required. However, there may be cases in which there are minor children but the question is not raised before the court because of a tacit agreement between the parents regarding custody of the children.

Marital status and age at marriage. Just over 92% of persons divorced in 1971 had not been married before as against 2% of widowed persons and 6% of persons previously divorced. This low percentage of persons previously divorced, as shown by the figures in Table 5.57, is explained by the relatively low proportion of remarried persons in the total population. These proportions should change in the future since there should be a decrease in the proportion of newly divorced persons and a corresponding increase in formerly divorced persons, because of the expected increase in the remarried proportion of the total population in the future.

Previous marital status, and even more important, age at the time of marriage, have always been cited as determining factors in the frequency of divorce. The new statistics confirm for Canada what has already been proved in other countries. Early marriage and remarriage considerably increase the risks of divorce. For each marriage duration, the probability of divorce increases in direct proportion to the precocity of marriage or with remarriage.

Table 5.58 gives the probability of marriages terminating in divorce for every 100 marriages, by age and marital status of the woman at the time of marriage and by the duration of marriage. This rate is what would be observed if a cohort of women were constantly exposed to the conditions existing in 1971.

These rates are probably too high to adequately reflect the underlying trend. As already mentioned, the 1971 divorce rates are still affected by conditions existing prior to enactment of the new legislation in 1968. However, it is unlikely that the rates by age at marriage or by marital status would be affected differently by this implicit distortion. In other words, while it may not be true that 30% of women who marry below the age of 20 and who were single at the time of marriage will be divorced after 30 years of marriage, nor that 15% of women marrying between 20 and 24 years of age will be divorced after 30 years of marriage, it is at least valid to state that women marrying below 20 years of age are divorced twice as often as those marrying between 20 and 24 years of age and three times as often as women who marry between 25 and 29 years of age.

Divorce is more frequent among women who were widows at the time of marriage and still more frequent among those previously divorced. Given the same age at marriage, widows are divorced twice as often as single women and divorcees three times as often.

5.9 Migration

Sections 5.5 to 5.8 of this Chapter were concerned with the vital components of population change (fertility, mortality, nuptiality). There remain the flows of population across national borders (immigration and emigration) which also affect the country's growth and demographic structure. The relative influence of net migration (the excess of immigrants over emigrants) compared to natural increase factors (the excess of births over deaths) in past growth rates of Canada over the period 1851-1971 are shown in Table 5.2. This Section provides recent data on the numbers and characteristics of immigrants entering Canada (Tables 5.59 to 5.66), as well as estimates of the numbers of emigrants leaving (Table 5.67). The

subject of internal migration receives only brief mention in this edition of the *Canada Year Book*, but some estimates of total net migration by provinces in the 1961-71 period can be observed in Table 5.5. Demographic studies resulting from the 1971 Census will provide the most recent trends on internal migration flows within Canada, as did the monographs on this subject from the 1961 Census relating to the preceding decade.

5.9.1 Immigration

The extent of immigration to Canada in any period is affected both by domestic conditions and by conditions abroad. A discussion of these factors, together with an analysis of recent trends, may be found in the 1972 *Canada Year Book* pp. 222-225. The numbers of postwar immigrant arrivals for each year over the period 1946-71 are shown in Table 5.59 of the present edition.

Origin of immigrants. In 1971, Canada received 121,900 immigrants from various countries of origin. This was a decrease of 25,813 or 17.5% from 1970. The reduction was a reflection, in part, of changing economic conditions in Canada and the increasing output of Canadian institutions of higher education which reduced the demand for skilled immigrants. Continuing favourable economic conditions in most western European countries were also a factor in reducing emigration from that area. Tables 5.60 and 5.61, showing the country of former residence and the country of citizenship of immigrants, respectively, indicate that by world area the continent of Europe and Australasia contributed a lower proportion of the total immigration stream in 1971 than in the previous year. On the other hand, there was an increased percentage of immigrants from the Americas, Asia and Africa.

Destination of immigrants. Upon arrival in Canada, immigrants are asked to state their intended destinations. According to these records, Ontario absorbed by far the highest proportion of arrivals in the three-year period 1969-71 – 53.3% of all the males and 54.2% of all the females. Quebec was the second most-favoured province of destination, receiving 16.6% of the males and 16.2% of the females, followed by British Columbia with 14.7% of the males and 14.4% of the females. The proportions intending to settle in the Prairie Provinces were 12.4% for both males and females, and in the Atlantic Provinces, 2.8%. The provincial distribution, as shown in Table 5.62 for 1970 and 1971, has changed little from year to year over the past two decades.

Sex, age and marital status. The sex distribution of immigrants in 1970 and 1971 is shown in Table 5.63. In the five years 1967-71, adult males constituted 37.6% of the immigrants, adult females 37.2%, and children under 18 years of age the remaining 25.2%. Without relation to age, 49.5% of the newcomers were females.

The number of female immigrants coming into Canada was higher than the number of male immigrants in every year from 1957 to 1964; since then, with the exception of 1969 and 1971, the trend has been in favour of males. In 1971, there was an excess of about 1,000 females over males (Table 5.64). Single males surpassed single females by over 5,000 but in all marital categories women outnumbered men: married females exceeded married males by 3,113; there were 3,281 widows compared to 545 widowers; divorcees outnumbered divorced men by 283; and separated females were 376 to 248 for males. Of the total immigration for 1971 of persons 15 years of age and over, 41.0% were single, 52.8% married, and 6.2% were widowed, divorced or separated.

Intended occupations. Some 61,282 persons were added to the labour force in 1971 compared with 77,723 in 1970. The remainder – those not destined for the labour force – were largely dependants of immigrants or close relatives sponsored by individuals in Canada. Skilled immigrants continued to fill acute shortages of qualified people in certain areas, thus providing essential services to the Canadian public. Table 5.65 shows that in 1971 alone, Canada admitted 987 physicians and surgeons, 55 dentists, 749 medical and dental technicians and 1,538 other professionals in the health services field. The mining industry attracted 103 mining engineers. The value of the education, training and experience of these professionals, as well as that of other newcomers, is immeasurable.

Deportations of immigrants. Deportations by cause and nationality are shown in Table 5.66 for the years 1970 and 1971. Persons who have not acquired domicile (five years of residence in Canada as landed immigrants) may be deported if they fall into prohibited classes at time of admission or within five years of admission, have engaged in commercialized vice, have been

convicted under the Criminal Code or have become inmates of prisons, or have gained admission to Canada by fraudulent means. The causes that may lead to deportation are narrowed after a person has acquired domicile. A person not yet a citizen may be deported regardless of length of residence if he is found to be a member of a subversive organization or engages in subversive activities, or if he has been convicted of an offence involving disloyalty to the Crown, or if he has, outside of Canada, engaged in activities detrimental to the security of Canada. A Canadian citizen cannot be deported.

5.9.2 Emigration

Emigration from Canada is a factor tending to offset to some extent present and past immigration activities. The major outward movement has always, of course, been to the United States and that movement, both of native-born Canadians and of Europeans who originally migrated to Canada, has attained considerable proportions at certain periods. No Canadian statistics on emigration are available but Table 5.67 gives figures taken from the annual reports of the Immigration and Naturalization Service of the United States Department of Justice. These figures show the numbers of persons entering the United States from Canada during the years ended June 30, 1962-71 with the expressed intention of establishing permanent residence in that country. They do not include persons travelling for pleasure, even for extended periods of time, holders of border-crossing cards (normally issued to persons living in border areas of Canada but working in the United States) or casual tourist crossings in these same areas.

Of the 13,128 Canadian-born persons entering the United States in the year ended June 30, 1971 with the intention of remaining permanently, 5,781 were males and 7,347 females. Nearly one fifth, or 2,592, of the total native-born emigrants were males in the productive age group, 20-59 years. By occupation, the largest group of the total of 13,128 native-born persons was the professional or technical group which numbered 1,703; clerical and kindred workers numbered 573; and craftsmen or foremen numbered 428. On the other hand 8,993 persons, or 68.5% of the total, were classed as housewives, children and others with no reported occupation. Altogether, 45.4% of the total were persons under 20 years of age.

Of the 22,709 persons entering the United States from Canada claiming Canada as country of last permanent residence – which of course includes native-born persons and those born in other countries who have resided in Canada – the Immigration and Naturalization Service of the United States Department of Justice lists 4,530 as professional, technical and kindred workers; 1,413 as craftsmen, foremen and kindred workers; and 1,049 as clerical and kindred workers. Housewives, children and others not in the labour force amounted to 12,314 or 54.2% of the total.

5.9.3 Internal migration

As people move from one place of residence to another within the nation's borders, freely and without restriction, they set up varying patterns of migration which differ in intensity and directional flow. These internal movements have marked effects on regional economies, and they exert an influence on future population growth. Thus it is important that attempts be made to measure these various migration flows, such as from rural countryside to urban centres, from cities to suburbs, from one province or economic region to another, and so on.

Various statistical methods are used in this measurement process but perhaps the most useful estimates are those resulting from the inclusion in national censuses of questions which seek to determine the exact place of residence of each person at the date of the preceding census five years earlier. From a comparison with the location of their present residence, it is possible to estimate the size, directional flows and characteristics of the migrating population over the period. Such questions were included in both the 1961 and 1971 Censuses of Canada. Data from the 1971 Census were not available in time for this edition, but migration trends in recent years from the 1961 Census have been issued in special monographs and other studies (notably census monographs, Catalogue Nos. 99-548 and 99-557; and other reports, e.g., Catalogue No. 99-513).

Census figures on birthplace (province of birth) provide additional data on internal migration flows, by comparing the numbers of persons born in a given province by their province of present residence. However, such figures give no indication of the periodicity of the migrating process. A different technique is illustrated in Table 5.5 which shows the total net migration for each province over the 1961-71 period. These figures include the effects of

immigration from abroad as well as internal movements but they are useful in showing the net results from all types of migration over an intercensal period. They also represent a technique that can be applied to individual counties, cities or other entities for which population counts and natural increase figures are available.

Finally, administrative records, such as those reporting changes of address by families receiving family allowances, help to shed light on the migrating patterns of Canadian families. For example, the family allowances data assist in arriving at the internal migration component for the annual estimates of population for provinces, counties and metropolitan areas issued by Statistics Canada (see also Section 5.2.1).

All figures of the 1971 Census in Tables 5.11 to 5.13, 5.15 to 5.16, and 5.23 to 5.30, have been subjected to a confidentiality procedure to prevent the possibility of associating small figures with any identifiable individual. The particular technique used is known as "random rounding". Under this method, all last or "unit" digits in a table (including all totals) are randomly rounded (either up or down) to "0" or "5". This technique provides the strongest possible protection against direct, residual, or negative disclosures without adding any significant error to the census data. However, since totals are independently rounded they do not necessarily equal the sum of individual rounded figures in distributions. Also, minor differences can be expected for corresponding totals and cell values in various census tabulations.

5.1 Growth of the population of Canada, Census years 1851-1971

Census year	Population No.	Increase during intercensal period		Average annual rate of population growth %
		No.	%	
1851	2,436,297			
1861	3,229,633	793,336	32.6	2.9
1871	3,689,257	459,624	14.2	1.3
1881	4,324,810	635,553	17.2	1.6
1891	4,833,239	508,429	11.8	1.1
1901	5,371,315	538,076	11.1	1.1
1911	7,206,643	1,835,328	34.2	3.0

2001	31,431.3	29.1	58.4	12.5	6.3	14.6	8.3	1.0

¹ Series A assumptions:

1. Mortality: expectation of life at birth will remain unchanged at 69.86 years for males and 75.75 years for females.
2. Fertility: will change from 2.19 children in 1971 to 1.90 in 1985 and then remain constant.
3. Migration: zero net migration.

² Series B assumptions:

1. Mortality: expectation of life at birth will increase gradually to 76.7 years for males and 84.5 years for females by 2001.
2. Fertility: will change from 2.19 in 1971 to 2.13 in 1985 and then remain constant.
3. Migration: net migration of 60,000 per year.

5.4 Population and percentage change of population, by province, Census years 1951-71

Province or territory	Population and percentage change				
	Population				
	1951	1956	1961	1966	1971
Newfoundland	361,416	415,074	457,853	493,396	522,104

¹ Figures for certain urban places may not be comparable for the periods shown because of changes in area boundaries, particularly for those indicated by an asterisk: c=city, t=town, b=borough, and dm=district municipality.

² As at the date of the 1971 Census.

³ By place of occurrence.

⁴ Population fewer than 50,000 at date of 1971 Census but included as the largest urban centre in Prince Edward Island.

Chapter 6

Health and welfare

6.1 Federal health organization and activities

Under the British North America Act responsibility for administration of health services is the direct concern of provincial governments, with municipalities often exercising considerable influence over matters delegated to them by provincial legislatures. Although patterns of health services in different provinces are similar, their organization, system of financing and administration vary from province to province.

On the national level, the Department of National Health and Welfare is the chief federal agency in health matters. In conjunction with other federal agencies and with provincial and local health agencies it works to raise the health level of all Canadians. The health side of the Department, under the Deputy Minister of National Health, is organized into three branches: Health Protection, Health Programs and Medical Services. In addition, there is a Long-Range Health Planning Group, and the separate Medical Research Council.

The Health Protection Branch provides services to protect the Canadian public from environmental health hazards of all types. It is composed of seven organizational units: Food, Drugs, Environmental Health, Non-medical Use of Drugs, Laboratory Centre for Disease Control, Field Operations and Administration Services. A central Epidemiology Service serves all health branches of the Department.

The Health Programs Branch administers federal aspects of Canada's two major health programs, hospital and medical insurance. This Branch is made up of the following units: Program Development and Evaluation, Hospital Insurance and Diagnostic Services, Medical Care, Research Programs, Health Economics and Statistics, Health Manpower, Health Facilities Design, Health Systems, Health Standards, Task Force on Community Health, and Program Finance and Administration.

The Medical Services Branch has direct responsibility for the health care and public health services of Indians and Eskimos and of all residents of the Yukon and Northwest Territories, as well as for quarantine and immigration medical services, public service health, a national prosthetics service, and civil aviation medicine.

Other federal agencies carry out specialized health functions; for example, Statistics Canada is responsible for gathering vital and other health statistics, the Department of Veterans Affairs administers hospitals and health services for war veterans, and the Canada Department of Agriculture has certain responsibilities connected with health aspects of food production.

6.1.1 Health care

6.1.1.1 Public medical care

The Medical Care Act was passed by Parliament in December 1966 and the medical care program began to operate on July 1, 1968. As of April 1, 1972 all provinces and territories had entered the federal program. Under the Act the federal government contributes to any one participating province one half of the per capita cost of all insured services furnished under the plans of all participating provinces, multiplied by the number of insured persons in that one province. The minimum criteria to be met are described in the following paragraphs.

Comprehensive coverage must be provided for all medically required services rendered by a physician or surgeon. There can be no dollar limit or exclusion except on the ground that the service was not medically required. The federal program includes not only those services that have been traditionally covered as benefits to a greater or lesser extent by the health insurance industry, but also those preventive and curative services that have been traditionally covered through the public sector in each province such as medical care of patients in mental and tuberculosis hospitals and services of a preventive nature provided to individuals by physicians in public health agencies.

The plan must be universally available to all eligible residents on equal terms and conditions and cover at least 95% of the total eligible provincial population. This "uniform terms and conditions" clause is intended to ensure that all residents have access to coverage and to prevent discrimination in premiums on account of previous health, age,

non-membership in a group, or other considerations. If a premium system of financing is selected, subsidization in whole or in part for low-income groups is permitted. It has been left to the individual province to determine whether its residents should be insured on a voluntary or compulsory basis. Utilization charges at the time of service are not precluded by the federal legislation if they do not impede, either by their amount or by the manner of their application, reasonable access to necessary medical care, particularly for low-income groups. The plan must provide portability of benefit coverage when the insured resident who has paid his premiums, if any, is temporarily absent from the province and when moving residence to another participating province. The provincial medical care insurance plan must be administered on a non-profit basis by a public authority that is accountable to the provincial government for its financial transactions. Provinces may assign certain administrative functions to private agencies.

These criteria leave substantial flexibility with each province to determine its own administrative arrangements for the operation of its medical care insurance plan and to choose the way in which it will be financed, i.e., through premiums, sales tax, other provincial revenues, or by a combination of methods. Federal contributions to the provinces under this program totalled \$589 million in the fiscal year 1971-72.

Provincial programs providing health care services (apart from those already insured under the Medical Care Act) for welfare recipients establishing eligibility on the basis of financial need are supported financially by the federal program known as the Canada Assistance Plan. This program provides for federal payment of one half of the cost of personal health care services, as well as welfare services. The provinces are free to make available a wide range of health care benefits.

6.1.1.2 Hospital insurance

Provincial hospital insurance programs, operating in all provinces and territories since 1961, cover 99% of the population of Canada. Under the Hospital Insurance and Diagnostic Services Act of 1957, the federal government shares with the provinces the cost of providing specified hospital services to patients insured by these programs. Specifically excluded are tuberculosis hospitals and sanatoria, hospitals or institutions for the mentally ill, and institutions providing custodial care, such as nursing homes and homes for the aged. The methods of administering and financing the program in each province and the provision of services above the stipulated minimum required by the Act are left to the province.

Insured in-patient services must include accommodation, meals, necessary nursing service, diagnostic procedures, pharmaceuticals, the use of operating rooms, case rooms, anaesthesia facilities, and the use of radiotherapy and physiotherapy if available. Similar out-patient services may be included in provincial plans and authorized for contribution under the Act. All provinces include some out-patient services, and most cover a fairly comprehensive range. The Government of Canada contributes to each province out of the Consolidated Revenue Fund, the sum of 25% of the per capita cost of in-patient services in Canada and 25% of the per capita cost of in-patient services in the province, multiplied by the average number of insured persons in that province. Thus, the total contribution is about 50% of the sharable cost for all Canada, but the proportion of federal support is higher in provinces where the per capita cost is below the national average and lower in the other provinces. Contributions for insured out-patient services in each province are paid in the same proportion as the contributions to the cost for in-patients.

Under the Established Programs (Interim Arrangements) Act, a province may contract out of various federal-provincial programs, including hospital insurance, and on January 1, 1965, Quebec did so. Accordingly the federal contribution to the Quebec hospital insurance program is made through tax abatement and not under the Hospital Insurance Act. Federal payments to the provinces (including Quebec) under this program for the fiscal year 1971-72 amounted to \$1,187 million.

6.1.1.3 Health manpower and resources

The Health Manpower Program of the Department of National Health and Welfare is designed to promote the development of health facilities and to support health resources studies into all aspects of the supply of health manpower. The federal Health Resources Fund Act of 1966 provided for the establishment of a fund of \$500 million to be applied to the costs between 1966 and 1980 of providing facilities for research and for training health professionals. Payments from the fund may cover up to 50% of the costs of functional planning,

constructing, renovating, acquiring and equipping facilities for education and research in health. As at March 31, 1972, \$255 million had been approved for payment to the provinces, of which \$180 million had been expended. About four fifths of this sum was for training facilities and one fifth for research establishments.

6.1.1.4 Health services for specific groups

Through its Medical Services Branch, the Department of National Health and Welfare provides or arranges for several types of medical and health service for persons whose care is by custom or legislation a federal responsibility.

Indian health services. Indians, as residents of a province, are entitled to the benefits of medical care and hospital insurance. These insured benefits are supplemented by Medical Services, which assists Indian bands in arranging for transportation and in obtaining drugs and prostheses. Emphasis is placed on a comprehensive public health program which provides dental care for children, immunization, school health services, health education, and prenatal, postnatal and well-baby clinics. Through direct financial assistance to organizations of native peoples, support is given to Indian programs directed toward improving the quality of life by means of adult education, family planning, accident prevention, venereal disease control programs, and the suppression of alcoholism and drug abuse. Since Indians comprise just over 1% of the Canadian population and are distributed widely throughout Canada, a network of specially designed health facilities has been constructed in almost 200 communities that would otherwise lack health facilities. Approximately 60 of these are nursing stations, 91 are health centres, 46 are out-patient clinics, and nine are hospitals.

Increasing numbers of Indians are being trained and employed in the public health and medical care programs to facilitate understanding and health activities in local communities.

Northern health services. The Department provides health services to all residents of the Yukon Territory and Northwest Territories. The services comprise all normal health department activities including a comprehensive public health program; special arrangements facilitate inter-station communication and the transportation of patients from isolated communities to medical centres. Several university groups have interests in delineated zones for the provision of medical personnel and students in rotation; their activities are supported financially through government contracts and medical care insurance. Departmental facilities include four hospitals, six clinics, 40 nursing stations, and 15 health stations. Both territories now have tax-supported hospital and medical care insurance programs.

Quarantine and regulatory service. Under the Quarantine Act, all vessels, aircraft, and other conveyances and their crews and passengers arriving in Canada from foreign countries are subject to inspection by quarantine officers to detect and correct conditions that could lead to the entry into Canada of such diseases as smallpox, cholera, plague, and yellow fever. Fully organized quarantine stations are located at all major seaports and airports. The Branch is responsible for enforcing standards of hygiene on federal property including ports and terminals, interprovincial means of transport, and Canadian ships and aircraft.

Immigration medical services. Under the Department of National Health and Welfare Act and the Immigration Act, the Medical Services Branch determines in Canada and other countries the health status of all applicants for immigration to Canada and some non-immigrants, and provides treatment for certain classes of persons after arrival in Canada, including immigrants who become ill en route to their destination or while seeking employment.

Public service health. The Medical Services Branch is responsible for a comprehensive occupational health program for federal employees throughout the country and abroad. This service includes health counselling, surveillance of the occupational and working environment, pre-employment, periodic and special examinations, first aid and emergency treatment, and a wide range of advisory services and special health programs.

Civil aviation medicine. The Department provides an advisory service to the Ministry of Transport concerning the health and safety of all those involved in Canadian civil aviation. Regional and headquarters aviation medical officers review all medical examinations, participate in aviation safety programs, and assist in air accident investigations. Close liaison with authorities responsible for foreign aviation medicine is maintained as standards are usually based upon international agreements.

Prosthetic services. The over-all objective of Prosthetic Services is to offer prosthetic and orthotic rehabilitation services to the amputee population and to other physically handicapped persons as provided for in agreements in effect with the provinces and with the Department of Veterans Affairs.

Unemployment insurance disability assessment. A number of Medical Services physicians provide an assessment and advisory service to the Unemployment Insurance Commission in relation to claims for benefits under the new Sickness and Maternity Benefit Plan which came into effect on July 1, 1971.

Emergency health services. The objective of this activity is to prepare plans to ensure that the health component of the Department is able to continue operating in the event or threat of nuclear attack, and to advise, assist and stimulate provincial and municipal health departments in emergency health planning.

6.1.2 Health protection

Through the Health Protection Branch the Department is responsible for protecting the Canadian public from possible risks to health from foods, drugs, cosmetics, medical devices and hazardous products sold on the market. Under the Food and Drug Act, standards of safety and purity in foods are developed through laboratory research and maintained by means of regular and widespread inspection programs. The Branch is also responsible for enforcing food and drug regulations which prescribe maximum concentrations of additives in specified foods. Every drug manufacturer is required by law to submit information to the Health Protection Branch on all products he intends to market in Canada. Decisions are based on this and other information regarding the type of control to be exercised.

6.1.2.1 Food

Standards of safety and purity are developed through laboratory research and maintained by means of a regular and widespread inspection program. The inspection of food-manufacturing establishments plays a major role in the production of clean, wholesome foods containing ingredients that meet recognized standards. Changing food technology requires the development of methods of laboratory analysis to ensure the safety of new types of ingredients and packaging materials. The Food and Drug Regulations list chemical additives that may be used in foods, the amounts that may be added to each food, and the underlying reason. Information on new additives must be submitted for careful review before they are included in the permitted list. Considerable emphasis is placed upon studies to ensure that the levels of pesticide residues in foods do not constitute a health hazard. The effect of new packaging and processing techniques on the bacteria associated with food spoilage is also of special concern.

6.1.2.2 Drugs

The Health Protection Branch regulates both the manufacture and distribution of drugs in Canada. The conditions under which drugs are to be manufactured are described in the Manufacturing Facilities and Control Regulations. They relate to facilities, employment of qualified personnel, quality control procedures, maintenance of records, and a suitable system to enable a complete and rapid recall of any batch of drugs from the market. Pharmaceutical plants are regularly visited by inspectors to ensure that the drugs produced meet the quality standards required for sale in Canada.

When a new drug with unknown properties is to be placed on the market, the manufacturer is required by law to provide specified information, including a quantitative list of all ingredients, evidence of clinical effectiveness, the formulation of dosage forms and reports of any adverse effects. This information is studied carefully to ensure that the drug is safe and effective for the purposes claimed. Even after a new drug is on the market, its sale can be banned by the Health Protection Branch if the Adverse Drug-Reaction Program indicates that the drug is unsafe and injurious to the health of the Canadian people. More recently, the Branch announced the establishment of a comprehensive Drug Quality Assurance Program aimed at producing objective evidence on the quality of drugs already on the Canadian market and disseminating it to members of the health professions, governments and the general public. Plants manufacturing biologicals such as serums and vaccines must also be licensed according to specifications of the Health Protection Branch, whether they are located in Canada or abroad.

Another major activity of the Branch is to enable the public to purchase high quality drugs

at the cheapest price. This program includes integrated action involving inspection of manufacturing facilities, assessing of claims and clinical equivalency of competing brands, and providing information to professionals concerned and to the general public.

6.1.2.3 Non-medical use of drugs

The objectives of the non-medical use of drugs program of the Branch may be described under four main headings: prevention, to develop and stimulate programs intended to prevent mind-altering drugs being used in ways that may result in physical, mental, and social health problems; treatment, to stimulate the development of effective means of dealing with the immediate physical and mental problems caused by the use of mind-altering drugs; rehabilitation, to stimulate the development of effective means of restoring casualties of mind-altering drugs to health; and education, to develop and promote information and education programs aimed at preventing drug abuse and at persuading smokers to stop and young persons not to start.

6.1.2.4 Environmental health

The Environmental Health Directorate of the Branch has recently become responsible for administering the Radiation Emitting Devices Act which regulates the manufacture and distribution of devices emitting high-frequency electromagnetic or ultrasonic waves. Other activities include investigation of potential future environmental hazards and support of research to gain the knowledge necessary to control air and water pollutants including noise and certain mineral elements.

6.1.2.5 Disease control

In the area of communicable disease control the Branch laboratories are involved in the development and implementation of preventive, diagnostic, quality control, and other measures directed to combat communicable disease agents. Other activities entail developing methods for detecting and preventing disease, producing and distributing standardized diagnostic agents to federal, provincial, and other health organizations, and providing a national reference service for identification of disease-producing bacteria, viruses, and parasites. Through the Epidemiology Division, the Branch assists in control of infectious and other diseases by disease surveillance, epidemiological studies and by providing assistance in epidemics.

6.1.3 Research, planning and consultative services

6.1.3.1 Medical research

Federal government expenditures for health science research in 1971-72 were estimated at \$63.1 million, an increase over the \$54.8 million recorded in 1970-71. The expenditures are accounted for by the Medical Research Council, \$35.6 million, the Department of National Health and Welfare, \$27.2 million, and the Department of Veterans Affairs, \$300,000.

Most federal grants supporting health science research in universities and hospitals are channelled through the Medical Research Council which reports to Parliament through the Minister of National Health and Welfare. The Council spent \$35.6 million in 1971-72, of which \$23.6 million was allocated for grants-in-aid, \$8.6 million for research scholarships and fellowships, and \$3.4 million for other research support and promotion. Dental and pharmaceutical research as well as medical research are included.

The Department of National Health and Welfare in 1971-72 distributed \$7.7 million under the Public Health Research Grant and the National Health Grant for applied and developmental research projects and related scientific activities conducted by universities, hospitals, health departments, and other non-profit health organizations. In addition, the Department paid \$66,000 for physiological research under the Fitness and Amateur Sport Grant, \$61,000 for food and drug research, and \$228,000 for research into the non-medical use of drugs. The expansion of research facilities continues to be one of the key objectives of the Health Resources Program; it is estimated that \$12.3 million, about 33% of the Health Resources Fund expenditures in 1971-72, was used to build research facilities.

The Department accounts for most of the intramural expenditures; \$6.7 million was spent on research and development studies and related scientific activities in health fields. Major subjects of research were pharmacology, pharmaceutical chemistry, nutrition, microbiology, pesticides, food additives, clinical laboratory procedures, health services, prosthetics, epidemiology, and physical fitness.

The Department of Veterans Affairs supports a variety of clinical studies in chronic disease problems including psychiatric research; total expenditures reached \$322,000 in 1971-72. Studies in radiation biology and other life sciences important to health are conducted by the National Research Council and are discussed in more detail in Chapter 9.

The principal voluntary agencies supporting medical research in Canada related to their special interests are: the National Cancer Institute, Canadian Arthritis and Rheumatism Society, Canadian Cystic Fibrosis Foundation, Canadian Association for the Mentally Retarded, Canadian Mental Health Association, Muscular Dystrophy Association of Canada, and Multiple Sclerosis Society of Canada.

Research is also funded by provincial governments through various councils and foundations as well as direct research grants. The Interdepartmental Committee on Medical Research, to which the voluntary agencies are invited, provides a forum for the sharing of information and support of medical research.

The Medical Research Council (MRC) is the main channel through which the federal government provides financial support for research in the health sciences initiated and carried out in Canadian schools of medicine, pharmacy and dentistry. It had existed in various administrative forms within the framework of the National Research Council since 1938 but in 1969, with the passage of the Government Organization Act, it became a departmental Crown corporation in its own right. It reports to Parliament through the Minister of National Health and Welfare but is completely separate from the Department. The Council itself is made up of a full-time president appointed by the Governor in Council, a vice-president and 20 members, drawn chiefly from the universities, who serve without remuneration for terms of up to three years. The program is administered by a small full-time secretariat of scientific and administrative personnel.

Under the terms of its legislation, the MRC has authority "to promote, assist and undertake research in the health sciences, with the exception of public health research". The latter, by statute, is the responsibility of the federal Department of National Health and Welfare. Its program is divided into three main sectors: grants, awards, and research development.

The Grants Program is by far the largest component of the MRC operation. Applications from investigators on the staff of Canadian universities and affiliated institutions are considered on three occasions each year. The basis for this consideration is peer assessment; each application is reviewed by external referees expert in the field involved and then considered by one of 17 grants committees, each composed of eight to ten senior investigators drawn from universities, government and industry. The recommendations of these committees are then forwarded to the Council and awards are approved to the extent that funds permit. Most are made on an annual basis but, where a research program of high merit has reached a stable level of expenditure, support in a specified annual amount may be provided for terms of three to five years. The grants are designed to provide for the normal operating costs of approved programs and for items of special research equipment; they may not be used for the remuneration of the investigator to whom the award is made.

The Awards Program provides support for research personnel in several categories. There are opportunities for research training of graduates of high calibre at the post-doctoral level through Fellowship and Centennial Fellowship programs and at the pre-doctoral level through a program of Studentships. These awards are all prize awards and the number of successful candidates is therefore limited. Many other research trainees, however, receive support through the operating grants to investigators who supervise their training. The MRC Associateship program provides continuing salary support for a limited number of highly qualified independent researchers working in universities and devoting at least 75% of their time to research and graduate teaching. The MRC Scholarship provides young investigators who have completed their formal research training with an opportunity to demonstrate in a university setting their potential for independent research without the necessity of, at the same time, carrying a heavy undergraduate teaching load; these awards are tenable for up to five years. Provision is also made for the exchange of information among Canadian scientists through the Visiting Professorship Program, and among Canadian scientists and their foreign colleagues by means of the Visiting Scientist Program under which Canadian investigators may spend up to one research year abroad or foreign scientists may spend periods of three to 12 months working in Canadian laboratories.

A significant portion of the MRC's developmental funds is used to assist in the correction of disparity, both regional and disciplinary, in Canada's research effort; universities attempting to build up programs in underdeveloped fields are encouraged to apply for Development Grants in a special program designed to assist the Deans of health science faculties in the recruitment of new staff by giving assurance of research funds and equipment, and, if necessary, of salary support for limited periods. A special Group Program has been developed to provide research support to groups of two or more accomplished investigators who wish to engage in collaborative work in what appear to be especially productive areas. Investigators comprising MRC Groups are expected to devote virtually all their efforts to their common research objectives, and receive from the MRC what is essentially full support of their research program. There are now six MRC Groups — the Group in Neurosciences at the University of Montreal, the Group in Transplant Research at the University of Alberta, the Group in Developmental Neurobiology at McMaster University, the Group in Drug Toxicology at the University of Montreal, the Group for Hypertension at the *Institut de Recherches cliniques de Montréal*, and the Group in Medical Genetics at McGill University. Under the heading of Research Development, the MRC also provides financial support for scientific symposia and workshops held in Canada, and assists in defraying the operating costs of the Canadian Council on Animal Care.

6.1.3.2 National Health Grant

The National Health Grant was established in April 1969 to stimulate research studies, service demonstrations, and training activities of national significance for the improvement of health services. Contributions from this grant may be made to provincial or municipal governments and to any agency, association, corporation, institution or individual capable of conducting activities in the health field. Awards to date have been mainly in support of training of research personnel in the health care field and for research projects related to analysis of quality of health care and health care delivery. Contributions made from this fund exceeded \$3 million in the fiscal year 1971-72.

In November 1972, the National Health Grant was extended to include the Public Health Research Grant (\$4.5 million in the fiscal year 1971-72) which had previously allocated funds for research in disease prevention, epidemiology, health promotion, and environmental health. The amalgamation was expected to permit a more unified approach to development priorities, as well as to ease certain administrative problems. The grants are administered by the Research Programs Directorate of the Health Programs Branch.

6.1.3.3 Health economics and statistics

The Health Economics and Statistics Directorate in the Health Programs Branch provides socio-economic research and advisory services in a variety of fields including medical care, hospital care, community health services, health expenditure, manpower resources, and other matters relating to health costs and utilization. The directorate also serves as a national centre for socio-economic research in the health field to produce research reports and publications designed to increase public understanding of the organization, cost and performance of Canada's health services and resources.

6.1.3.4 Long range health planning

The long range health planning group is concerned with identifying and assessing major issues and trends in the health field which have either not yet clearly emerged or on which no consensus has yet been reached. In a sense the Branch tries to bring into focus the unstable or unpredictable elements of the health field so that they can be considered by policy makers. By comparison the operating Branches tend to plan more in the implementational and operational elements.

Specialists in the long range health planning group are available in the following fields: policy review, medicine, lifestyle health problems, medical sociology, health status indicators, health care organization, quantitative methods and pharmaceutical economics.

6.1.3.5 Consultative and technical services

The Department of National Health and Welfare extends technical advisory services to provincial agencies, universities and other organizations for the development of health programs, health manpower, and health research. Consultative services are available through

the various administrative units of the Department responsible for federal-provincial health care programs such as hospital insurance, medical care insurance and health grant programs that have a service, demonstration, research, or educational objective: the Non-medical Use of Drugs Program, the Family Planning Grant, the National Health Grant (now including the Public Health Research Grant), and the grants for health manpower development. Consultants are engaged in health facilities design and in most areas of community health including mental health and health education. Other technical advice is available through programs directly operated by the Department for health protection including the safety of foods, drugs and health appliances, environmental health, the Laboratory Centre for Disease Control and other specialized areas.

6.1.4 International health

Canada actively assists and co-operates with the World Health Organization (WHO) and the other specialized agencies of the United Nations whose programs have a substantial health component or orientation. Capital and technical assistance are provided to developing countries through the Colombo Plan and other bilateral aid programs. Health training is provided for a number of persons coming to Canada each year under various technical assistance schemes and in co-operation with the PAHO/WHO Fellowships Programs.

Canadian experts in health legislation, health administration, environmental health, nursing, and related areas undertook specific assignments abroad during the year and teachers and specialists in a number of clinical fields were provided in response to requests from developing countries. Capital assistance under the Canadian International Development Agency program, primarily through the provision of cobalt-60 beam therapy units for cancer treatment centres in the Colombo Plan and Caribbean areas, was continued. As a result of a visit to Viet-Nam in 1967, recommendations of the Advisory Team on the Viet-Nam Medical Program regarding tuberculosis, rehabilitation, immunization, hospital equipment and other programs have been implemented; the tuberculosis program was again reviewed during visits by an expert in 1970 and succeeding years. Canadian participation in this project was phased out during 1972. Projects for training in public health are in development in Viet-Nam and in Cameroon.

The Department is responsible for the enforcement of regulations governing the handling and shipping of shellfish under the International Shellfish Agreement between Canada and the United States. Other responsibilities include the custody and distribution of biological, vitamin, and hormone standards for WHO and certain duties in connection with the Single Convention on Narcotic Drugs, 1961, as well as Canada's representation on the Narcotic Commission of the United Nations.

6.2 Provincial and local health services

Provincial governments administer medical and hospital insurance programs, and are primarily responsible for health measures to prevent disease and improve the health standards of the community. These include preventive health services, hospital services, treatment services for tuberculosis, mental illness and other diseases, and rehabilitation and care of the chronically ill and disabled. Most health functions are administered from within provincial health departments, but in some provinces certain programs such as hospital insurance, medical care insurance, tuberculosis control, cancer control, and alcoholism and drug addiction programs are directed by separate public agencies directly accountable to the Minister of Health. Voluntary organizations also provide specialized health services.

Local programs to safeguard community health are concerned with environmental sanitation to ensure safe water, milk and other foods, prevention and control of infectious diseases through use of vaccines and prophylactics, improvement of maternal and child health, family planning, dental health, registration of vital statistics, and health education and counselling. In addition, the larger city health departments and health units have developed specialized services in such areas as mental health, home care and rehabilitation of the chronically ill and the handicapped. A few health units and departments in most provinces carry out health screening for chronic conditions. Local health services also participate with provincial authorities in accident prevention programs and in measures to control pollution of the air, water and soil.

6.2.1 Public health services

6.2.1.1 Occupational health

Services designed to prevent accidents and occupational diseases and to maintain the health of employees are the common concern of provincial health departments, labour departments, workmen's compensation boards and industrial management. Provincial agencies regulate working conditions and offer consultant and educational services to industry. All provinces have legislation (factory Acts, shop Acts, mines Acts, workmen's compensation Acts) setting standards for health safety and accident prevention on the job. Most provinces maintain environmental health laboratories that study industrial health problems such as the effects of noise and air conditions on workers.

6.2.1.2 Communicable disease control

The larger provincial health departments have separate divisions of communicable disease control headed by full-time epidemiologists; in others, this function is combined with one or more community health services. Local health authorities organize public clinics for immunization against diphtheria, tetanus, poliomyelitis, whooping cough, smallpox and measles. They also engage in case-finding and diagnostic services in co-operation with public health laboratories and private physicians. Special services for tuberculosis and venereal disease are described in Sections 6.2.3.1 and 6.2.3.3.

6.2.1.3 Health education

Most provincial health departments have a division or unit of health education under a full-time professional "health educator" to promote public knowledge of health needs and measures. These divisions provide educational materials to other divisions of the health department, local health authorities, schools, voluntary associations, and to the public. Many educational activities are directed to accident prevention and to changing habits harmful to health, such as cigarette smoking and the excessive use of alcohol and other drugs. All health workers carry out health education as part of their normal activities.

6.2.1.4 Public health laboratories

All provinces maintain a central public health laboratory and most have branch laboratories to assist local health agencies and the medical profession in the protection of community health and the control of infectious diseases. Public health bacteriology (testing of milk, water and food), diagnostic bacteriology, and pathology are the principal functions of the laboratory service, with medical testing for physicians and hospitals steadily increasing in volume.

6.2.1.5 Maternal and child health

Public health nurses employed by local health services carry out programs of preventive health care to mothers, the newborn and children through clinics, home and hospital visits and school health services. All provincial health departments have established maternal and child health consultant services to co-operate with the public health nursing services. The maternal and child health services also undertake studies in maternal and child care, including hospital care, and assist in the training of nursing personnel.

6.2.1.6 Nutrition

Provincial health departments and some city health departments employ consultants in nutrition to extend technical guidance and education to health and welfare agencies, nursing homes and other care institutions and hospitals. They also provide diet counselling to selected patient groups such as diabetics, and conduct nutritional surveys and other research.

6.2.1.7 Dental health

Public dental health programs at the provincial level have been largely preventive, but increasing emphasis is now being given to dental care. Dental clinics conducted by local health services are generally restricted to pre-school and younger school-age groups. A number of provinces send dental teams to remote areas and subsidize resident dentists to practise in areas lacking such services, while the four western provinces have dental care schemes of varying coverage for welfare recipients. Other dental health programs are directed to the training of dentists and dental hygienists, conducting dental surveys, and the extension of water fluoridation.

6.2.2 Mental health services

Mental health services in Canada are organized as part of provincial health services. As public health officers, mental health directors and their associates are responsible for the development of programs aimed at prevention of mental disease and for the general promotion of mental health, on their own and in co-operation with welfare, education, manpower, labour and justice departments. As psychiatric specialists, they are responsible for the over-all development and supervision of the various medical facilities for the treatment of people who suffer from mental or emotional disorders including disorders of character and behaviour, the mentally retarded, people with damage to the nervous system, alcoholics and drug addicts.

The continuing efforts by provincial health departments to provide more and better mental health services reflect growing enlightenment about mental health on the part of the medical profession, the general public and government agencies. Improvement in the care of psychiatric patients has been fostered by activities of voluntary organizations such as the Canadian Mental Health Association and the Canadian Association for the Mentally Retarded; by the professional advice of the Canadian Medical Association and the Canadian Psychiatric Association; by the national health grants and the national welfare grants for new services, professional training and scientific research; and through the information programs of the federal Department of National Health and Welfare.

Extending mental health services into the community is intended to prevent severe mental and emotional breakdowns and to reduce the number of people requiring treatment in institutions. Under the terms of the federal-provincial medical care legislation and its provisions, the services of private psychiatrists have become more widely available. Through early diagnosis and treatment in a mental health clinic or out-patient department of a hospital, troubled persons may continue to live at home and pursue their normal occupations while receiving treatment. Special centres have been established for the study and treatment of alcoholism and drug addiction, criminal psychopathy, psychiatric disorders in children, brain injuries, mental retardation and genetic and neurological disorders.

6.2.3 Services for specific diseases or disabilities

6.2.3.1 Tuberculosis and respiratory diseases

Tuberculosis statistics reported by Statistics Canada for 1971 show little or no change from the 1970 figures: new active cases totalled 3,943, or 18.3 per 100,000 population, and reactivated cases numbered 622 or 2.9 per 100,000. In 1970, there were 527 deaths from tuberculosis or 24 per 100,000, compared with 526 deaths in 1969. Altogether, Canadians reported to be under treatment for tuberculosis in 1971 numbered 9,610, while an additional 11,504 susceptible persons received prophylactic drugs as a preventive measure. Further details on the incidence of tuberculosis will be found in Table 6.26.

Provincial health departments, assisted by voluntary agencies, conduct anti-tuberculosis case-finding programs through community tuberculin-testing and X-ray surveys, with special attention to high-risk groups, routine hospital admission X-rays and follow-up of arrested cases. However, practising physicians detect the greatest number of new cases.

BCG vaccine, estimated to be effective for 80% of those vaccinated, is used in most provinces to protect high-risk groups. Quebec and Newfoundland routinely immunize children and in the Yukon Territory, BCG is routinely administered to all newborn. Treatment, including hospital care, drugs and rehabilitation services, is free in all provinces. Chemotherapy has shortened hospital stay and facilitated out-patient or domiciliary care.

6.2.3.2 Cancer

As the second leading cause of death in Canada, cancer accounts for about one of every five deaths, most of them occurring in the middle and later years of life. The standardized death rate from cancer has been rising steadily, from 136.3 per 100,000 population in 1969 to 137.5 in 1970. The standardized death rate for females declined slightly, from 114.4 in 1969 to 114.2 in 1970 whereas the standardized rate for males increased from 157.6 in 1969 to 160.2 in 1970. Statistics on the incidence of new cancer cases will be found in Table 6.27.

Special provincial agencies for cancer control, usually in the health department or a separate cancer institute, carry out cancer detection and treatment, public education, professional training, and research in co-operation with local public health services, physicians

and the voluntary Canadian Cancer Society branches. Although the provisions are not uniform, cancer programs in all provinces provide a range of free diagnostic and treatment services to both out-patients and in-patients financed by the hospital insurance programs or the federal-provincial cancer control grants (the federal Cancer Control Grant lapsed in 1971-72). Hospital insurance benefits for cancer patients include diagnostic radiology, laboratory tests and radiotherapy. The cancer control programs in Saskatchewan and New Brunswick also pay for medical and surgical services; in most provinces these costs are covered under the public medical care insurance schemes.

6.2.3.3 Venereal diseases

Public health authorities estimate that the real incidence of venereal diseases may be three to four times the number of cases actually reported. The 1971 figure of 2,489 cases of syphilis or 11.5 per 100,000 population was slightly lower than for 1970. In contrast, the total figure for gonorrhea cases in 1971 was 34,405 or 158.7 per 100,000, a marked increase over the 147.6 rate for 1970, the highest since 1947. In 1971, one fifth of all gonorrhea cases were reported for the 15- to 19-year age group while 36.9% were aged 20-24 years. Factors affecting this rise in gonorrhea incidence are increasing sexual permissiveness combined with reliance on contraceptive methods that do not prevent the spread of infection.

The real impediments to control of venereal diseases are negative attitudes and behaviour patterns, sometimes the result of ignorance, that permit cases to go undiagnosed or untreated and contacts unlocated. Provincial health departments have expanded public VD clinics, which provide free diagnostic and treatment services at convenient hours. In some areas these departments pay private physicians to give free treatment to indigents. In addition, the provinces supply free drugs to physicians for treating private cases. Local departments of health or district health units carry out case-finding, follow-up of contacts, and health education programs, assisted by provincial directors of venereal disease control.

6.2.3.4 Alcoholism

In all provinces, health departments or other official agencies administer programs for the prevention and control of alcoholism, including public education and related studies. Conservative estimates place the number of Canadians currently requiring these services at 270,000, if a clinical definition of alcoholism is used. Available treatment services are mainly for out-patients but, with the increasing awareness of need, most provinces have expanded facilities for in-patient services. Other facilities operated by official and voluntary agencies include hostels and special farms or prison centres for chronic offenders with drinking problems. In several provinces, alcoholics are treated in detoxication units or wards rather than in jails. Provincial alcoholism agencies in Ontario, Quebec and Saskatchewan have broadened their programs to include other addictions, while British Columbia supports a separate narcotic addiction foundation. Because addictions are widely prevalent, street clinics, hospitals, mental health services and other public and voluntary health and social agencies are also involved in their diagnosis and treatment.

6.2.3.5 Other diseases or disabilities

Many services for persons with chronic disabilities, such as heart disease, arthritis, diabetes, visual and auditory impairments, and for paraplegics, have been initiated by voluntary agencies assisted by federal and provincial funds. Today, treatment for specific conditions is available at hospital out-patient clinics and in-patient or day centres, at separate clinics and rehabilitation centres, and under home care programs.

Medical rehabilitation services, which offer physical medicine, physiotherapy, occupational therapy, speech therapy and social services, carry out assessment and remedial treatment and training. Some facilities, especially rehabilitation centres, also provide vocational rehabilitation and special education services. Mainly established in teaching hospitals located in the larger urban centres, these services financed under the provincial hospital insurance programs at the end of 1970 numbered 36 hospital rehabilitation units, 15 separate in-patient rehabilitation centres (with a total of 945 beds) and five out-patient rehabilitation centres. In addition, there were two private hospitals for crippled children, about 20 out-patient rehabilitation centres for children supported by voluntary and provincial funds and five rehabilitation centres for injured workmen.

Most large general hospitals conduct out-patient clinics for various diseases and disabilities including arthritis and rheumatism, diabetes, glaucoma, speech and hearing defects, heart diseases, and orthopedic and neurological conditions.

Special schools or classes for various groups of handicapped children are, typically, operated by school boards whereas most of the 17 schools for the deaf and the six schools for the blind are residential schools operated by provincial governments. In 1971-72, there were 3,410 students enrolled in schools for the deaf and 682 in schools for the blind.

6.2.4 Provincial hospital insurance programs

Newfoundland, Saskatchewan, Alberta and British Columbia were operating hospital insurance plans prior to the proclamation of the Hospital Insurance and Diagnostic Services Act in 1957. These provinces and Manitoba entered federal-provincial agreements on July 1, 1958, the earliest possible date under the new Act. Prince Edward Island, Nova Scotia, New Brunswick and Ontario followed in 1959, the territories in 1960, and Quebec in 1961. Effective January 1, 1965, Quebec elected to accept cost-sharing tax abatements in lieu of hospital insurance payments under the Established Programs (Interim Arrangements) Act.

Plans are administered by provincial departments of health or social affairs in some provinces, and by separate commissions in others. In some provinces, hospital insurance and medical care insurance are combined under one administration.

Coverage is automatic or compulsory in most provinces for all residents; however, in Ontario some persons are eligible to remain outside the plan as noted below, while in Alberta a resident who elects to remain outside the medical care plan must also "opt out" of the hospitalization plan.

Provincial plans assure all approved available in-patient services at the standard ward level as indicated in the federal Act and agreements. In view of the federal requirement all provinces guaranteed to provide these services upon entering into agreements and there has been virtually no change in the range of services insured on an in-patient basis during the years since the Act took effect.

Out-patient services have remained an option of the province. In the initial years of operation under the Act many provincial plans provided only limited out-patient services; however, there has been a continuous improvement in coverage throughout the years and all provinces now provide a fairly comprehensive range of insured out-patient services.

All plans pay for insured in-patient services in other provinces of Canada at the rates prevailing in those provinces. Prior approval of the Commission is required by Nova Scotia and Prince Edward Island except for emergency care. Restrictions regarding rates and the volume of services are applied by most plans to in-patient services outside Canada. Payments for out-of-province out-patient services are more restricted; Nova Scotia and Quebec make no payments unless by special agreement in border areas; other provinces make payments subject to maximums for rates and volumes.

Some plans also insure services which are excluded under the federal Act and which are consequently not subject to cost sharing. These include coverage in psychiatric hospitals in Nova Scotia and Ontario. Ontario also provides essential ambulance services at a modest cost, care in tuberculosis sanatoria, care in nursing homes where medically necessary subject to a daily charge, and physiotherapy, occupational and speech therapy in non-hospital facilities. Alberta provides nursing home care and care in senior citizens lodges subject to appropriate charges, and physiotherapy services in non-hospital facilities.

Provinces finance their portion of the cost of hospital care through a variety of methods including general revenue, premiums, sales or property tax, authorized charges payable at the time of hospitalization, or various combinations of these sources. Newfoundland, Prince Edward Island, New Brunswick, Quebec, the Yukon Territory and the Northwest Territories finance their programs from general revenues. British Columbia and the Northwest Territories also levy authorized charges. Other provinces use general revenue to some extent to supplement other sources of revenue. Nova Scotia levies a provincial sales tax. Ontario charges a monthly premium of \$5.50 for single persons and \$11.00 for families. There is a compulsory payroll deduction in relation to establishments with 15 or more employees including the employer. With respect to other persons the program is available on a voluntary basis. In Manitoba the monthly premium for single persons is \$3.60 and for families \$7.20. A 6% charge on personal income tax and an extra 1% tax on the taxable income of corporations are levied to provide for costs not covered by premiums. In Saskatchewan the annual premium of hospitalization tax is \$24 for single persons and \$48 for families. In Alberta the joint premium charged for medical care and hospital insurance is \$5.75 per month for single persons and \$11.50 for families. These funds are augmented by authorized charges and a mill rate on property.

Revenues and expenditures of public hospitals¹ and cost per patient-day

1. General, allied special, mental and tuberculosis.

No premiums are payable in Ontario, Saskatchewan or Alberta by persons 65 years of age or over or in Manitoba by persons receiving the old age security pension plus the maximum guaranteed income supplement from the Government of Canada. Exemptions also apply to persons in receipt of provincial welfare assistance.

Alberta, British Columbia and the Northwest Territories levy authorized charges directly to patients for insured services. In Alberta in-patients of general hospitals are charged \$5.00 for the first day of care, while patients receiving auxiliary (chronic) hospital care are charged \$3 per day commencing with the 121st day of care. In British Columbia in-patients pay \$1 per day and in the Northwest Territories \$1.50. In British Columbia there is also a charge of \$1 for specified out-patient services. There are also charges in some provinces for those services which are additional to the provisions of the federal Act. For example, Ontario has a mileage charge for ambulance services and a daily charge for nursing home care. In Alberta there are charges for care in nursing homes and senior citizens lodges.

6.2.5 Provincial medical care programs

When the criteria stipulated under the Medical Care Act (Section 6.1.1.1) have been met by a province, the federal government contributes an annual sum equal to half the national per capita cost of insured services multiplied by the average number of insured persons in that province. Although co-insurance or deterrent charges are not favoured by the federal government, they are not ruled out by the federal Act, provided that they are not of such a size as would violate the principle of universality by denying services to low-income groups. Since the implementation of the Act, only one province, Saskatchewan, charged a deterrent fee, but this was abandoned in 1971.

As with hospital insurance, a variety of methods is used at the provincial level to finance its share of the cost. Combined hospital and medical premiums are charged in Ontario and Alberta, but are waived for those over 65, as they are in Saskatchewan. Premiums partially finance the plans of British Columbia, Saskatchewan, Manitoba and the Yukon Territory, the remainder of the cost being covered by general revenues. No medicare premiums are charged in New Brunswick, Nova Scotia, Prince Edward Island, Newfoundland and the Northwest Territories, where the plans are financed through general revenues. Quebec levies a special income tax surcharge and a similar levy on employers to finance its program.

Coverage for medical care benefits in Canada is approaching the 100% mark. The only exclusions are those covered under workmen's compensation legislation, or programs for the Armed Forces, the Royal Canadian Mounted Police, war pensioners and inmates of federal penitentiaries. In Saskatchewan, coverage is compulsory, but eligibility for benefits is linked to premium payments. Coverage by the combined plan in Ontario is on a compulsory basis for employee groups of more than 15 persons, but is voluntary for others. British Columbia's plan is totally voluntary. In other premium-paying plans (such as in Manitoba and the Yukon Territory) premium payment has been separated from entitlement to benefits. In non-premium provinces, all residents are insured. As with hospital insurance, the patient is allowed free choice of physician when he seeks treatment. Many provincial medical plans also provide additional benefits beyond those required by the national legislation, such as optometrical services.

Although most basic medical costs are covered by the program, there still exists a need in certain quarters for benefits supplementary to those already provided. In the case of needy citizens, it is possible for the federal government, through the provinces, to finance half the cost of other health care services such as dental services, prescription drugs or eyeglasses through the Canada Assistance Plan. Eligibility for such assistance depends upon a needs test. Each province administers its supplementary welfare programs as it sees fit, and there is no uniformity among them.

Additional coverage for the balance of the population is either paid for entirely by the individual himself or can be purchased through a private carrier. At its discretion, any carrier can market coverage for drugs, dental services, special nurses, allied health professionals, prosthetic appliances, or the cost of extended care accommodation. However, most commercial carriers have displayed a reluctance to market coverage on a non-group basis, and most of the above benefits have been included under "major medical" contracts.

In all provinces, provision has been made for physicians to "opt out" of the medical care plan and to bill their patients directly, rather than through the public authority. Opted-out doctors are generally required to inform their patients of their intention before treating them and they usually charge more than the benefits payable by the provincial plan for their services. This means that their patients are not usually reimbursed for the full amount when they submit their bills to the provincial medical care plan for payment. Opting out by physicians is not a particularly widespread phenomenon in most provinces, being limited to less than 10% of all doctors, and in some provinces there are no opted-out doctors. Many of the non-participating doctors, however, do not in practice bill for a fee higher than the benefits available under the plan if they are aware of an individual's financial difficulties.

6.2.6 Emergency health services

The Emergency Health Services Division, established in 1959 within the federal Department of National Health and Welfare, encourages the provinces, with the support of an advisory committee, to develop their own emergency health services divisions. These are organized under a provincial director who is generally assisted by a health-supplies officer and

a nursing consultant. Federal Emergency Health Services are represented by a staff officer in each province.

The fourfold task of provincial emergency health services is to ensure that vital health functions are maintained during or reorganized after an emergency or disaster; to encourage and assist local planners in the establishment of emergency medical units; to train health professionals and the general public in emergency health procedures; and to place emergency medical units from the national stockpile at strategic locations.

6.3 Medical manpower

6.3.1 Earnings of privately practising physicians

The average gross professional earnings of fee-practising physicians in 1970 were \$50,819, which was 9.7% higher than in 1969 and 93.1% higher than in 1962. The highest average gross earnings in 1970 were reported in Alberta, at \$59,457. In Ontario, Manitoba and Newfoundland they were above the national average and in the remaining provinces they ranged from \$49,178 in Saskatchewan to \$37,269 in the Yukon and Northwest Territories.

Generally, through the nine-year period 1962-70, average gross earnings have been at a higher level in Newfoundland, Ontario and the western provinces than in Quebec and the Maritime Provinces.

The net returns to physicians, after deduction of the expenses of professional fee practice, reveal similar geographic patterns. Net earnings for Canada as a whole averaged \$34,360 in 1970, 11.3% higher than in 1969 and 102.5% above the 1962 figure. The highest provincial average net income was reported by Newfoundland physicians at \$41,562 followed by Alberta physicians at \$39,678.

6.3.2 Number of physicians

In December 1971 there were 32,625 active civilian physicians in Canada. Well over a third, 12,506, were located in Ontario. British Columbia had the lowest population/physician ratio, 615, followed by Ontario with 621, and Manitoba and Quebec, 645 and 662, respectively. The national average at December 1971 was 666 persons per physician.

Table 6.1 gives the provincial distribution and population per physician ratios for 1971 and shows also the historical trend in the national total since 1901. The figures include all junior and senior interns and residents, and physicians engaged in administration, teaching, research, etc., within the medical field, as well as those in the clinical practice of medicine.

6.4 Fitness and amateur sport

The Fitness and Amateur Sport Program was inaugurated in 1961 to increase the number of participants at all levels of competitive and non-competitive physical recreation and amateur sport activity; to help provide the participants with the skills, the means and the opportunity to benefit from recreation; and to help make available to all citizens the facilities and leadership to participate freely in recreational activities of their choice. These objectives are predicated on the assumption that every Canadian should develop a level of fitness sufficient to contribute positively to his physical and mental health and that Canadian athletes should develop a level of performance in national and international competitions which will contribute to national unity and international prestige.

A National Advisory Council on Fitness and Amateur Sport, consisting of not more than 30 members appointed by the Governor in Council with at least one from each province, considers problems connected with such activity and advises the Minister of National Health and Welfare thereon.

The Minister proposed, in March 1970, a new government sports policy for Canadians which identified the twin concerns of competitive excellence and mass participation. To accommodate these areas of concern the program has been divided into two divisions: Sport Canada which has as its primary task the competitive excellence of Canada's athletes; and Recreation Canada which works to encourage increased levels of participation in physical activity. To increase the administrative strength of Canadian sports and recreation agencies the program makes available administrative, financial and other professional assistance.

The federal program for 1972-73 concentrates on: grants and support to national fitness and sport organizations to improve the standards of administration, coaching and instruction, to increase the rate of participation in physical recreation and to provide aid to the holding of

competitions; promotion and support of special projects including the Arctic Games, the Canada Games and the Canada Fitness Award, and assistance in the holding of sports events of nation-wide interest; planning, training, research and communications in support of increased participation in physical recreation by all Canadians; and grants-in-aid to student athletes.

6.5 Federal welfare and social security programs

Responsibility for social welfare is shared by all levels of government. Comprehensive income maintenance measures such as the Canada Pension Plan, old age security pensions, the guaranteed income supplement program, family allowances, youth allowances and unemployment insurance, where nation-wide co-ordination is required, are administered federally. The federal government gives substantial aid to the provinces in meeting the costs of public assistance and also provides services for special groups such as veterans, Indians, Eskimos and immigrants. The Department of National Health and Welfare is generally responsible for federal welfare matters, although the Departments of Veterans Affairs, Indian Affairs and Northern Development, and Manpower and Immigration operate programs for specific groups.

Administration of welfare services is primarily the responsibility of the provinces but the provision of services is often assumed by local authorities, generally with financial aid from the province.

A channel of communication between citizens groups and the Department of National Health and Welfare is provided by the National Council of Welfare. As reconstituted in January 1970, the Council now consists of 21 private citizens about half of whom have been selected from organizations of consumers of welfare services and the remainder from institutions involved, directly or indirectly, in providing welfare services. The Council is responsible for advising the Minister of National Health and Welfare on such matters related to welfare as it deems appropriate as well as to consider matters referred to it by the Minister.

6.5.1 Canada Pension Plan

The Act establishing the Canada Pension Plan (CPP) received Royal Assent on April 3, 1965 and was proclaimed in force on May 5 of the same year. Collection of contributions commenced in January 1966, and in January 1967 the first benefits were paid in the form of retirement pensions. In February 1968 the first survivors benefits were paid, and in February 1970 the first disability benefits were paid.

The Plan is applicable throughout Canada except in Quebec where a comparable pension plan has been established. Until 1973 the Canada and Quebec Pension Plans were closely co-ordinated and operated virtually as a single program. Benefit credits accrued under the Canada or Quebec Plans are portable throughout Canada. Effective January 1, 1973, however, Quebec made substantial changes to its Pension Plan which were not made in the Canada Plan. An outline of these revisions appears in Section 6.7.6.

Under the national Plan, maximum pensionable earnings will be adjusted each year to the end of 1975 in line with changes in the pension index which, in turn, is based on the consumer price index. For 1973 the maximum pensionable earnings are fixed at \$5,600. Beginning in 1976, maximum pensionable earnings for a year will be adjusted in accordance with changes in the earnings index to reflect changes in average wage and salary levels in Canada.

To participate in the Plan, a person must be between the ages of 18 and 70 and earn more than \$600 yearly as an employee, or at least \$800 if he is self-employed. Employees contribute at the rate of 1.8% and a matching contribution is made by their employers; self-employed persons contribute at the rate of 3.6%. Although contributions are made on annual earnings between \$600 and the earnings ceiling, rates of benefit are calculated on total earnings up to that maximum.

The earnings-related component of the benefit which a person is entitled to receive is based on the contributor's average pensionable earnings. Before this average is calculated, however, all earnings are adjusted in line with the average of the maximum on pensionable earnings during the benefit year and the two preceding years. Thus, when a benefit first becomes payable, the earnings on which it is based are related to the maximum on pensionable earnings at that time rather than when the earnings were received.

Benefits are classified under three main categories: retirement pensions; survivors benefits, consisting of a widow's pension, a disabled widower's pension, orphans benefits, and

a lump-sum death benefit; and disability benefits comprising pensions for disabled contributors and benefits for their dependent children. Summary statistics on benefits being paid out of the Canada Pension Plan as at March 1972 appear in Table 6.2.

Beginning in 1970, retirement pensions became payable to contributors aged 65 years or over provided that, if under age 70, they are retired from regular employment; a person under age 70 in receipt of a retirement pension must meet an earnings test. For contributors who have reached age 70, retirement pensions are payable regardless of whether or not they are retired. They become payable at their full rate beginning in January 1976. This rate amounts to 25% of what the updated pensionable earnings of contributors have averaged since January 1, 1966. Contributors who become eligible for retirement pensions prior to 1976 receive reduced amounts. (The method of calculation of these benefits is discussed in detail in previous editions of the *Canada Year Book*.)

Survivors benefits are paid to or on behalf of the survivors of a deceased contributor who has made contributions for the present minimum qualifying period of three years for those whose benefits commence before 1975.

A woman who is widowed between ages 45 and 65 is entitled to a widow's pension consisting of the flat-rate payment plus 37½% of her husband's retirement pension. For 1973 the flat-rate component is \$28.15. Should her husband not be in receipt of a retirement pension at the time of his death, such a pension is calculated in the prescribed manner for the purposes of computing the amount of the widow's pension. If a woman is widowed under age 45, the same pension is paid provided she has dependent or disabled children or is herself disabled. If she does not meet any of these requirements, her pension is reduced by an amount equal to 1/120 for each month she is less than age 45 at the time of her husband's death. Accordingly, if a woman is widowed at age 35 or less, and has no dependent or disabled children and is not herself disabled, she will not receive a widow's pension until she reaches 65 years of age, unless she becomes disabled in the meantime.

A widow aged 65 or over receives a widow's pension equal to 60% of her husband's retirement pension, regardless of her age at the time her husband died or whether she was receiving a widow's pension before she became 65. Again, if her husband was not in receipt of a retirement pension at the time of his death, one is calculated in the prescribed manner in order to compute the amount of the widow's pension. Women who receive widow's pensions may also have contributed to the Canada Pension Plan themselves and consequently may be entitled to retirement or disability pensions in their own right. In such cases, the widow's pension will be combined with the other pension, in accordance with a prescribed formula, but the combined total cannot exceed the maximum retirement pension payable under the Act.

A disabled widower's pension is payable to a disabled widower if he was wholly or substantially dependent on his wife for financial support at the time of her death. The test of disability is the same as that for a person who claims a disability pension and the pension formula is the same as that for a widow aged 45 or more.

Orphans benefits are payable on behalf of a deceased contributor's unmarried dependent children. The rate for each of the first four children is equal to the flat-rate component of the widow's pension (\$28.15 for 1973); for more than four children the total benefit, which is divided equally among the children, is the sum of \$28.15 for each of four, and half of that amount for each child in excess of four. Benefits are payable until the child reaches age 18 or up to age 25 if he continues to attend school or university full-time.

A contributor is considered to be disabled if he has a physical or mental disability that is so severe and likely to continue so long that he is incapable regularly of pursuing any substantially gainful occupation. Disability pensions, plus benefits for the dependent children of disabled contributors, are available provided contributions have been made to the Plan for the present minimum qualifying period of five years. The amount of the pension consists of a flat-rate payment equal to the flat-rate component of a widow's pension plus 75% of what the contributor's monthly retirement pension would have been had he reached age 65 when his disability pension commenced. Benefits are payable on behalf of a disabled contributor's dependent children at the same rates and under essentially the same circumstances as the orphans benefits.

When a contributor dies, a lump-sum death benefit equal to six times his monthly retirement pension is paid to his estate. This benefit is subject to a maximum of 10% of the maximum on pensionable earnings. Should a contributor not be in receipt of a retirement

Canada Pension Plan benefits: number of beneficiaries, by type of benefit, as at December 31, 1967-72

pension at the time of his death, a calculation is made in the prescribed manner to establish the amount of the death benefit.

All monthly benefits are adjusted upward annually effective each January if changes in the pension index warrant it. The maximum increase is 2%.

Any contributor or beneficiary under the Plan has the right to appeal decisions with which he is dissatisfied. Appeals by employees and employers regarding coverage and contributions are first made to the Minister of National Revenue and, if the individual is not satisfied with the Minister's decision, he may appeal to the Pension Appeals Board whose decision is final. For self-employed persons, appeals with reference to the assessment of their earnings for Canada Pension Plan purposes are treated in the same way as appeals under the Income Tax Act. With respect to benefits, there is a three-stage appeal procedure: first, to the Minister of National Health and Welfare; second, to a Review Committee; and third, to the Pension Appeals Board whose decision is final.

The legislation provides for the investment of the funds that accrue from monthly contributions, less the estimated amounts required to pay benefits and administrative costs over a three-month period. These funds are made available to each province on the basis of the relationship between the contributions made to the Plan by and on behalf of residents of that province and the total contributions made to the Plan. Funds not borrowed by the provinces are invested in federal securities. The Canada Pension Plan is entirely self-supporting in that all benefits and all costs incurred in the administration of the program are financed solely from the contributions made by employees, employers and self-employed persons and the interest earned from the investment of funds. A statement of the Canada Pension Plan's financial situation appears in Tables 6.3 and 6.4.

An Advisory Committee representing employers, employees, self-employed persons and the public, reviews from time to time the operations of the Plan, the state of the investment fund and the adequacy of coverage and benefits, and reports to the Minister of National Health and Welfare. The legislation authorizes arrangements to be made with other countries to achieve as full coverage of persons in the labour force in Canada as is possible and to ensure the portability of pension credits between Canada and the countries concerned.

The Minister of National Health and Welfare is responsible for the administration of all parts of the program except coverage and the collection of contributions which come under the jurisdiction of the Minister of National Revenue. The Unemployment Insurance Commission is responsible for the assignment of social insurance numbers and for the maintenance of the Central Index. The Department of Finance is responsible for the administration of the Canada Pension Plan Account and the Canada Pension Plan Investment Fund. The Department of Supply and Services gives assistance to the Department of National Health and Welfare in the operation of the electronic data processing service which is required to maintain the records of earnings of contributors and to calculate benefits payable under the Plan. The Chief Actuary, Department of Insurance, is responsible for the preparation of reports on the future financial progress of the Plan and on the effect on the Fund of proposed amendments to the Plan.

The Canada Pension Plan Administration of the Department of National Health and Welfare consists of a head office establishment in Ottawa, a network of district offices located in the major population centres in Canada outside Quebec, and local offices operated on a part-time basis.

Private pension plans. Subsequent to introduction of the Canada and Quebec Pension Plans, legislation aimed at establishing more uniform standards for private pension plans was introduced at the federal level as well as in a number of provincial jurisdictions. A more detailed description appears in the *1972 Canada Year Book*, p. 360.

6.5.2 Old age security and guaranteed income supplement

Old age security. Under the Old Age Security Act of 1951, as amended, the federal government pays a monthly pension to all persons aged 65 or over who meet the necessary residence qualifications. Effective from April 1, 1973, the basic old age security pension was raised to \$100 a month. This will be adjusted each April by the full increase in the consumer price index.

The old age security pension is payable to a person of attained age who has resided in Canada for ten years immediately preceding the approval of his application for the pension. Any gaps in the ten-year period may be offset if the applicant had been present in Canada in earlier years for periods of time after reaching age 18 equal in total to three times the length of the gaps; in this case, however, the applicant must also have resided in Canada for one year immediately before the month in which his application for pension may be approved. The pension is also payable to persons of attained age who have left Canada before reaching that age but who have had 40 years of residence in Canada since age 18. A pensioner may absent himself from Canada and continue to receive payments. If he has lived in Canada for 20 years since his 18th birthday, payment outside Canada may continue indefinitely; if not, payment is continued for six months, in addition to the month of departure, and is then suspended, to be resumed only with the month in which he returns to Canada.

The program is administered by the Income Security Branch of the Department of National Health and Welfare through regional offices located in each provincial capital; application for pension should be made through these offices. The regional office in Edmonton administers the program for residents of the Yukon and Northwest Territories. Up to the end of 1971, the old age security plan was financed through a 3% sales tax, a 3% tax on corporation income and, subject to a limit of \$240 a year, a 4% tax on taxable personal income. The revenues from these sources were paid into the Old Age Security Fund. The Old Age Security Act was amended effective January 1, 1972, to repeal these taxes and to provide for the crediting to the Fund of an amount estimated to be equal to what would have been credited had these taxes not been repealed. Old age security pensions and benefits under the guaranteed income supplement program are paid from the Fund. Summary statistics concerning the old age security program appear in Tables 6.5 and 6.6.

Guaranteed income supplement. A 1966 amendment to the Old Age Security Act provides for the payment of a monthly guaranteed income supplement (GIS) to old age security pensioners who have little or no income other than the pension. When the program commenced on January 1, 1967, the maximum supplement was \$30 a month; after 1967, it was 40% of the amount of the old age security pension. An amendment passed in December 1970 raised the maximum monthly supplement to \$55 for a single pensioner and to \$95 for a married couple, both of whom were pensioners. A further amendment in 1972 increased the GIS benefits to \$67.12 a month for a single pensioner and \$119.24 for a married couple effective January 1, 1972. The increase in the basic OAS pension to \$100 and escalation of GIS benefits effective April 1, 1973 will provide a minimum income consisting of the OAS pension and GIS supplement of \$170 a month for a single pensioner and \$325 a month for a pensioner couple. GIS benefits are escalated each April by the full increase in the consumer price index.

Pensioners with income in addition to their old age security pension may receive partial benefits. The maximum supplement is reduced by \$1 a month for every full \$2 a month of income over and above the old age security pension and any supplement that may have been received. Income for this purpose is the same as that computed in accordance with the Income Tax Act. In the case of a married couple, each is considered to have one half of their combined income. Where one spouse will not be receiving an old age security pension at any time in the current year, six times the amount of the monthly old age security pension is deducted from one half of the combined income in calculating the income of the pensioner for guaranteed income supplement purposes.

The guaranteed income supplement program is administered in conjunction with the old age security pension program. An application for the supplement is sent to each person when he begins to receive the old age security pension and subsequently at the beginning of each calendar year. Entitlement is reassessed each year on the basis of the pensioner's income in the preceding year.

6.5.3 Family allowances

The Family Allowances Act of 1944 assists in providing equal opportunity for all Canadian children. The allowances do not involve a means test and are paid from the federal Consolidated Revenue Fund. They do not constitute taxable income but there is a smaller income tax exemption for children eligible for allowances.

Allowances are payable in respect of every child under age 16 who was born in Canada, or who has been a resident of the country for one year, or whose father or mother has been domiciled in Canada from a date three years immediately prior to the date of birth of the child. Payment is made by cheque each month, normally to the mother, although any person who substantially maintains the child may be paid the allowance on his behalf. Allowances are paid at the monthly rate of \$6 for each child under ten years of age and \$8 for each child age ten or over but under 16 years. If the allowances are not spent for the purposes outlined in the Act, payment may be discontinued or made to some other person or agency on behalf of the child. Allowances are not payable for any child who fails to comply with provincial school attendance legislation, who ceases to be maintained by a parent or who ceases to be a resident of Canada, or on behalf of a girl who is married and under age 16. Details of the operations of the plan for the year ended March 31, 1972 appear in Table 6.7.

The program is administered by the Department of National Health and Welfare through regional offices located in each provincial capital. The regional director located at Edmonton also administers the accounts of residents in the Yukon Territory and Northwest Territories.

The federal government pays family assistance, at the rates applicable for family allowances, for each child under 16 years of age resident in Canada and supported by an immigrant who has landed for permanent residence in Canada, or by a Canadian returned to Canada to reside permanently. The assistance, which is payable monthly for the first year of the child's residence in Canada, is intended to bridge the gap until the child becomes eligible for family allowances. The eligibility requirements, other than that relating to residence, are the same for family assistance as for family allowances.

Quebec introduced its own family allowances program, supplementing the federal scheme, under legislation enacted in 1967 (see Section 6.7.4). The Newfoundland program, called the Parents' Supplement (Schooling Allowance) introduced in 1966 under which payments were made for children attending school, was discontinued in July 1972.

6.5.4 Youth allowances

Legislation providing for a program of youth allowances became effective September 1, 1964. The federal government does not provide youth allowances in Quebec, which has had its own program called Schooling Allowances since 1961 (see Section 6.7.5). Quebec is compensated by a tax abatement adjusted to equal the amount that the federal government would otherwise have paid in allowances to Quebec residents. The federal youth allowances and the comparable Quebec schooling allowances programs cover all eligible young people in Canada. Summary statistics of the operations of this program at the federal level appear in Table 6.8.

Under the federal program, monthly allowances of \$10 are payable for all dependent children aged 16 and 17 who are receiving full-time educational training or are precluded from doing so by reason of physical or mental infirmity. Both the parent or guardian and the child must normally be physically present and living in a province other than Quebec. The allowance is not payable to a parent who resides in Quebec or outside Canada, regardless of where his child may be attending school. However, a child may attend school in Quebec or outside Canada, or, if disabled, receive care or training in Quebec or outside Canada and still be considered eligible, on the basis that he is a resident of a province other than Quebec but is temporarily absent.

Allowances normally commence with the month following that in which family allowances cease and continue until the school year terminates. They are paid retroactively for the summer months when the child returns to school at the commencement of the new school year, although allowances for a disabled child not attending school are payable continuously throughout the year. Should a student leave school, leave the country permanently, cease to be maintained, take up residence in Quebec, or die, the allowance ceases. Otherwise, the youth allowance continues until the end of the month in which the young person reaches age 18. Youth allowances are not considered to be income for any purpose of the Income Tax Act.

The program is administered by the Income Security Branch of the Department of National Health and Welfare through regional offices located in each of the provincial capitals other than Quebec City. The costs of youth allowances are met from the Consolidated Revenue Fund.

6.5.5 Emergency welfare services

The function of the Emergency Welfare Services Division of the Department of National Health and Welfare is to develop community capability to provide, in the event of a national emergency, essential welfare services not available through established welfare agencies. A 1965 Order in Council set up five emergency welfare services — emergency clothing, emergency feeding, emergency lodging, registration and inquiry, and personal services — and gave the division responsibility for the continuation of welfare departments in support of rehabilitation and recovery. To these ends, policy has been defined, systems designed and, at all levels of government, welfare resources planned.

In peacetime, trained specialists within the federal, provincial and municipal departments of welfare, organized nationally, are responsible for developing an emergency welfare capability. The program is an integral part of the Canada Survival Plan and is co-ordinated with the programs of other Canadian government departments and private agencies. Leaders are trained in the art of organizing large numbers of volunteers for emergency welfare operations and a public education program is maintained. Special printed forms and equipment for survival, not regularly available through commercial sources, have been produced and are located strategically across Canada.

6.5.6 International welfare

Canada is actively involved in the social development activities of the United Nations and in the work of a number of international voluntary agencies in the social welfare field; it is also a member of the Executive Board of the United Nations Children's Fund. In addition, the Canadian government, together with provincial governments and agencies, participates actively in the work of several international voluntary organizations including the International Council on Social Welfare and the International Union of Family Organizations.

The Department of National Health and Welfare, through the programs of the Canadian International Development Agency, assists in the planning and implementation of a number

of social welfare projects in developing countries, provides advisers for services abroad, and arranges for training for students and government officials when recommended by their governments.

A Convention on Social Security between Canada and the Federal Republic of Germany became effective May 1, 1972. The general purpose of the convention is to ensure that rights acquired under certain social security programs in one country are not lost by persons who migrate to and perhaps become citizens of the other country. Discussions concerning bilateral agreements on social security have been held with the United Kingdom, Italy and the United States. Australia has proposed an agreement with Canada. A number of other countries have expressed interest in possible agreements.

Canadian officials engaged in the social security field participate in the work of the International Social Security Association and the social security program of the International Labour Organization. For some years, Canada has had observer status at meetings of the Inter-American Social Security Association.

6.6 Federal-provincial welfare programs

6.6.1 Canada Assistance Plan

The Canada Assistance Plan was enacted in 1966 as a comprehensive public assistance measure to complement other income security measures. It provides, under agreements with the provinces, for federal contributions of 50% of the costs of assistance to persons in need and of the costs of certain welfare services. The Plan has largely replaced the Unemployment Assistance Act, 1956, although the latter continues in effect in the Northwest Territories and in some provinces for an interim period with respect to certain programs using a means test that are being phased out but that are not covered under the Canada Assistance Plan. The arrangements for contracting out of certain shared-cost programs introduced in 1965 under the Established Programs (Interim Arrangements) Act are applied to Quebec's agreement. The Plan authorizes the provinces to discontinue their programs of blind persons allowances and disabled persons allowances and instead give aid under their general programs with costs shared under the Plan. The sharing of costs of work activity projects to prepare persons for employment and the extension of provincial welfare services to Indians on reserves, on Crown lands or in unorganized territory are governed by special agreements. Statistics on the number of beneficiaries of assistance under the Plan as well as on the amounts of allowances paid and the cost to the federal government are shown in Tables 6.9 - 6.10.

The only eligibility requirement specified is that of need, which is determined through an assessment of budgetary requirements as well as of income and resources but rates of assistance and other eligibility requirements are set by the province so that they may be adjusted to local conditions and the needs of special groups. A province may not, however, require previous residence as a condition of eligibility for assistance or for continued assistance, and the provinces must establish procedures for appeal from decisions that relate to the provision of assistance.

"Assistance" for purposes of federal contributions includes any form of aid to or on behalf of persons in need for the purpose of providing basic requirements such as food, shelter and clothing; items necessary for the safety, well-being or rehabilitation of a person in need, or for a handicapped person; care in homes for special care such as a home for the aged, a nursing home or a welfare institution for children; travel and transportation; funerals and burials; health care services; welfare services purchased by or at the request of provincially approved agencies; and comfort allowances for inmates of institutions.

The federal share of costs under the Unemployment Assistance Act amounted to \$1.7 million during the year ended March 31, 1972. This includes payments to Quebec under the Established Programs (Interim Arrangements) Act.

6.6.2 Blind and disabled persons allowances

Federal reimbursement to the provinces for assistance to blind persons and persons permanently and totally disabled, aged 18 or over, is provided for under the Blind Persons Act, 1951, as amended, and the Disabled Persons Act, 1954, as amended. To be eligible for an allowance under either of these Acts, an applicant must meet the ten-year residence requirement and the income requirements. Total income, including the allowance, may not exceed \$1,260 a year for an unmarried person, \$2,220 a year for a married couple or \$2,580 a

year for a married couple when the spouse is blind within the meaning of the Blind Persons Act. Under the Blind Persons Act, total income, including the allowance, may not exceed \$1,500 a year for an unmarried person, \$1,980 a year for a person with no spouse but with one or more dependent children, \$2,580 for a married couple and \$2,700 a year for a married couple when the spouse is also blind.

The federal contribution is 50% of \$75 a month or the allowance paid, whichever is less, for disabled persons allowances, and 75% of \$75 a month or the allowance paid, whichever is less, for blind persons allowances.

Beginning on April 1, 1965 payments to Quebec have been made under the terms of the Established Programs (Interim Arrangements) Act.

Under the terms of the Canada Assistance Plan, a province may elect to aid needy persons in these categories under a general assistance program with costs shared under the Plan. By the end of 1972 Newfoundland, Prince Edward Island, Nova Scotia, Quebec, Ontario, Saskatchewan and Alberta had discontinued receipt of applications for disabled persons allowances, and four of these provinces, Quebec, Ontario, Saskatchewan and Alberta, had also discontinued receipt of applications for blind persons allowances.

Details on the operations of the various programs of allowances for the blind and for disabled persons appear in Table 6.11.

6.6.3 National welfare grants

The National Welfare Grants program was established in 1962 to help develop and strengthen welfare services in Canada. Under the program, project grants are made to provincial and municipal welfare departments, non-governmental welfare agencies, citizen organizations and universities. Fellowships are provided to individuals seeking advanced training in the social welfare field. The variety of provisions within the program along with its associated consultative services allows it to operate as a flexible instrument in the development of welfare services and to give major emphasis to experimental activities in the welfare field. The allotment for the year ended March 31, 1972 was almost \$2.7 million.

General welfare bursary training and staff development grants are available to provinces on a shared-cost basis, with the other provisions of the program being administered and financed entirely by the federal government. Demonstration, research and social action projects in a wide range of social welfare subject areas are eligible for grants, as are developmental projects related to welfare manpower. Fellowships available for study at Canadian and foreign universities and grants available to assist Canadian schools of social work with teaching and field instruction costs are scheduled to terminate March 31, 1974.

With the advent of the Canada Assistance Plan, increasing attention has been given to experimental activities under the National Welfare Grants program to encourage innovative approaches to the solution of social problems and the provision of welfare services.

Effective April 1, 1967, a mental retardation grant was established for a five-year period; part of this grant is administered in conjunction with the National Welfare Grants program and the original term has now been extended to permit complete utilization of the fund. Support is given to research and demonstration projects designed to expand knowledge and to apply that knowledge to the provision of services and to preventive programs in that field.

Expenditures under the National Welfare Grants program for the year ended March 31, 1972 totalled \$2.3 million and under the Mental Retardation Grant \$138,446. Of the former, \$1.0 million was expended on demonstration projects, \$410,127 on research projects, \$576,951 on manpower utilization and development, including demonstration, national agency, teaching and field instruction, fellowships and scholarships, \$139,818 on general national agency projects and \$118,067 on general welfare projects including the provincially administered bursary and staff development programs.

6.6.4 Vocational rehabilitation

The federal-provincial vocational rehabilitation program, which began in 1952, was consolidated and extended under the Vocational Rehabilitation of Disabled Persons Act, 1961. Agreements under this Act provide for equal sharing of costs between the federal government and the provinces or territories. These costs include co-ordination and provision of services to disabled or other vocationally disadvantaged individuals, training of rehabilitation personnel, and research and publicity. Approved services supplied by a

provincial government or purchased from voluntary agencies by a provincial government include medical, social and vocational assessment, intensive counselling, restorative services, the provision of prostheses, vocational or educational upgrading, rehabilitation allowances, work conditioning, and provision of tools, books and other equipment. Employment counselling and placement are provided through the Canada Manpower Centres of the Department of Manpower and Immigration or by the voluntary agencies from which services are purchased.

In each participating province, a provincial co-ordinator or director of rehabilitation is responsible for the co-ordination and administration of services to disabled or vocationally disadvantaged persons. The federal aspects of the program are administered by the Manpower Utilization Branch of the Department of Manpower and Immigration in co-operation with the Department's five regional offices. The Manpower Utilization Branch also has responsibility for the development of services for other persons suffering occupational disadvantages. Its role is to encourage a more favourable employment climate for older workers through a continuing educational program, to encourage research, maintain liaison with management, labour and voluntary agencies, to assemble and disseminate informational material concerning gerontology in industry, and to furnish supportive services to the Canada Manpower Centres.

In the year ended March 31, 1972, federal expenditures under the vocational rehabilitation program totalled \$6.5 million. Reports received on 5,909 disabled persons rehabilitated during the year indicated that, at the end of the year, 4,005 of them were rehabilitated to regular employment and 428 to sheltered employment or self-care; 240 were rehabilitated as homemakers. The cost of support of those who obtained employment and of their dependants was estimated, before rehabilitation, at \$4 million annually; their aggregate earnings, following rehabilitation, were estimated at \$16 million.

6.6.5 Family planning

A Family Planning Division in the Social Allowances and Services Branch of the Department of National Health and Welfare was established in January 1972 to provide a centre of responsibility for the federal family planning program. Its objective is to ensure the accessibility and availability of family planning services to all Canadians who want them. The division carries out this mandate by informing Canadians about the purpose and methods of family planning so that the exercise of free individual choice in this area will be based on adequate knowledge; by promoting the training of health and welfare professional and other staff involved in family planning services; by promoting relevant research in family planning; and by supporting family planning programs operated under public or voluntary auspices through federal grants-in-aid and joint federal-provincial shared cost programs.

The Division's program includes consultation, information, and family planning grants. Informational-educational materials on family planning, sex education, and family life education are distributed in quantity, free of charge, by the Division.

During the 1972-73 fiscal year, a total of \$1.1 million was available through the family planning grants for the support of family planning services and demonstration, training, and research projects. Grants have been made for research fellowships, seminars, conferences and the programs of national voluntary agencies.

6.7 Provincial welfare programs

Major welfare programs governed by provincial legislation include social assistance, services for the aged and child welfare services. In addition, Quebec operates the Quebec Pension Plan which is comparable to the Canada Pension Plan described in Section 6.5.1, a youth allowances program as outlined in Section 6.7.5, and a supplementary family allowances program, details of which appear in Section 6.7.4. Provincial departments of public welfare are responsible for the administration of welfare programs, although they may share their administration in certain fields with their municipalities.

Public services are supplemented by those of voluntary agencies whose interests include the welfare of families and children and of groups with special needs, such as the aged, recent immigrants, youth groups and released prisoners. Welfare councils and social planning councils contribute to the planning and co-ordinating of local welfare services. Local voluntary agencies and institutions may receive public grants, depending on the nature and standard of their services, although their main support is usually from United Appeal funds or from sponsoring organizations.

6.7.1 Social assistance

All provinces make legislative provision for assistance to persons in need and their dependants. All have incorporated provisions for allowances to needy mothers with dependent children in a broadened program of provincial allowances to several categories of persons with long-term need or in a general program under which the only eligibility requirement is need, irrespective of the cause of need.

In addition to allowances to cover items of basic need, such as food, clothing, shelter, fuel and utilities, all provinces make provision for such special items as rehabilitation services, expenses incidental to education or obtaining employment, counselling, homemaker services and institutional care. The provinces are reimbursed by the federal government under the Canada Assistance Plan for 50% of the costs of assistance and of certain welfare services given by the provincial and municipal authorities (Section 6.6.1). The provincial departments of welfare set rates of assistance and conditions of eligibility; they have regulatory and supervisory powers over municipal administration of assistance, and require certain standards as a condition of provincial aid. Length of residence is not a condition of aid in any province, but municipal residence may determine the financially responsible authority. The provincial authority takes responsibility for aid in unorganized areas within the province and for persons who lack municipal residence.

The administration of assistance varies. In four provinces, allowances to persons with long-term need such as needy mothers with dependent children, disabled persons and the aged, are administered by the province and other allowances are administered by the municipalities. In Newfoundland, Prince Edward Island and New Brunswick, all assistance is administered by the provincial authority. In Quebec, the province administers assistance through regional and local offices, except in the city of Montreal where the municipality administers assistance on behalf of the province. In Saskatchewan, social assistance is administered by the province except in two municipalities which elected to retain responsibility for administration of the program. In British Columbia, a comprehensive program of general assistance is administered by the local authority, i.e., by the municipalities except in sparsely populated municipalities and in areas without municipal organization where aid is administered by the province; the province also administers a program of supplementary allowances to recipients of old age security pensions, and the two categories of federal-provincial allowances. In the seven provinces where the municipalities have some administrative responsibility, the proportion of the costs of aid borne by the province varies from 40% to 100%.

6.7.2 Child welfare services

Child welfare services, which include child protection and care, services for unmarried parents and adoption services, are available under provincial legislation in all provinces. The programs are administered by the provincial authority or by local children's aid societies (voluntary agencies with boards of directors operating under charter and under the general supervision of provincial departments). In Newfoundland, Prince Edward Island, New Brunswick, Saskatchewan and Alberta, child welfare services are administered by the province; in Quebec, they are administered by recognized voluntary agencies and institutions, religious and secular; in Ontario, a network of local children's aid societies is responsible for the services; in Nova Scotia, Manitoba and British Columbia, services are administered by local children's aid societies in the heavily populated areas and by the province elsewhere.

Children's aid societies and the recognized agencies in Quebec receive substantial provincial grants and sometimes municipal grants and in many areas they also receive support from private subscriptions or from United Appeal funds. The costs of certain services and maintenance costs for children in care of a voluntary or public agency are sharable with the federal government under the Canada Assistance Plan as described in Section 6.6.1.

Services are provided as appropriate and include services to children in their own homes, care in foster boarding homes or adoption homes or, for children who need it, in selected institutions. Institutions for children are governed by provincial child welfare legislation and are generally subject to inspection and in some provinces to licensing. Children placed for adoption may be wards or they may be placed on the written consent of the parent. Adoptions, including those arranged privately, number about 20,000 annually.

Day nurseries for the children of working mothers are operated under either voluntary or

public auspices. A number of provinces make capital grants for the establishment of day care centres and provide operating subsidies.

6.7.3 Living accommodation for elderly persons

In all provinces, homes for the aged and infirm are provided under provincial, municipal or voluntary auspices. These homes are required to meet standards set out in provincial legislation relating to homes for the aged, welfare institutions or public health. Voluntary homes are usually provincially inspected and in some provinces must be licensed.

All provinces in varying degrees make capital grants toward the construction or renovation of homes for the aged by municipalities or voluntary organizations and, generally speaking, such homes are exempt from municipal taxation. Some provinces also make provision for capital grants to municipalities, charitable organizations or non-profit corporations for the construction of low-rental housing for elderly persons. These projects are usually built under Section 15 of the National Housing Act, which provides for long-term low-interest loans to non-profit corporations constructing low-rental self-contained or hostel accommodation for older people. Units for the aged may also be included in low-rental public housing projects for families, built under Section 43 of the Act.

In some provinces efforts are made to place well, elderly people in small proprietary boarding homes. Those who are chronically ill may be cared for in chronic or convalescent hospitals, private or public nursing homes and some homes for the aged. All provinces contribute to the maintenance of needy persons in homes for the aged or other homes for special care, and these costs are shared by the federal government under the Canada Assistance Plan (see Section 6.6.1).

6.7.4 Quebec's family allowances program

Quebec introduced its own family allowances program under legislation enacted in 1967. Under this plan, the following allowances are paid at the end of each six-month period to persons satisfying the relationship and residence requirements in respect of children under 16 years of age: \$15 for one child, \$32.50 for two children, \$52.50 for three children, \$77.50 for four, \$107.50 for five, \$142.50 for six, and an extra \$35 for each child after the sixth. These allowances are increased by \$5 for each child between the ages of 12 and 16 years. To qualify for the allowances, children must attend school regularly from the time when they are first required to do so, unless prevented by physical or mental infirmity. These allowances supplement those paid under the federal scheme.

6.7.5 Quebec schooling allowances

The federal government does not provide youth allowances in Quebec, which has had its own program, called Schooling Allowances, since 1961. With the introduction of the federal youth allowances scheme, Quebec agreed to make certain changes in its schooling allowances program so that it would be comparable to the federal measure.

Monthly allowances of \$10 are payable with respect to dependent youths aged 16 and 17 who are in school full time or prevented from full-time school attendance by mental or physical infirmity. Parents must be resident in the province of Quebec but children may attend school or, if disabled, receive care or training anywhere inside or outside Canada. Allowances normally commence with the month following that in which family allowances cease and continue until the end of the month in which the youth reaches age 18. Allowances are suspended for July and August but are paid retroactively for these two months at the commencement of the new school year, with the exception that allowances are paid continuously throughout the year with respect to disabled youths. Should a student leave school, leave Quebec permanently, cease to be maintained, or die, the allowance will cease.

Quebec is compensated by a tax abatement adjusted to equal the amount that the federal government would otherwise have paid in allowances to Quebec residents.

The Schooling Allowances program is administered by the Quebec Department of Social Affairs. In March 1972, 201,119 youths were assisted under this program. Expenditures for 1971-72 amounted to \$23 million.

6.7.6 Quebec Pension Plan

The Quebec Pension Plan was established in 1965 as the Quebec counterpart of the Canada Pension Plan for operation in the province. Until the end of 1972 both plans were closely co-ordinated and operated virtually as a single program.

In 1972 Quebec amended its Plan to make changes to take effect on January 1, 1973. Maximum escalation under the pension index was raised from 2% to 3%. Maximum pensionable earnings were increased from \$5,500 in 1972 to \$5,900 in 1973; these ceilings will rise to \$6,100 in 1974 and to \$6,300 in 1975. The widow's pension, the disabled widower's pension for pensioners under 65 and the disability pension were all increased in that the flat rate portion of these pensions which was \$27.60 a month in 1972 was increased to \$80.00 in 1973. The amount of orphan's benefit and the benefit for a disabled contributor's child will no longer be reduced when the number of children in a family exceeds four. The orphans' and children's benefits will be fixed at \$29.00 a month from January 1974. The retirement test was altered as well; commencing in 1973 a retired pensioner under age 70 will be entitled to earn \$1,020 annually and still receive the full amount of his pension and when his earnings are over \$1,020 the pension will be reduced by 50 cents for each dollar earned in excess of this amount. Administrative arrangements have been worked out between the Canada Pension Plan and Quebec Pension Plan to deal with dual contributors. In 1971, 125,343 beneficiaries received \$43.5 million in benefits.

6.8 Health and welfare statistics

6.8.1 Government expenditures on health and welfare

In the years ended March 31, 1963-71, expenditures by all levels of government on health and social welfare rose approximately two and a half times from \$3,899 million to an estimated high of \$10,027 million. If these figures are adjusted to take account of the growth in population, the increase in per capita expenditures from \$208 to \$466 was about 124%. Government expenditures may also be measured in relation to major economic indicators; on this basis, annual government expenditures on health and social welfare over the 1963-68 period remained relatively stable, fluctuating between 11.5% and 12.9% of net national income and between 8.6% and 9.7% of gross national product. Since 1968, however, they have tended to rise from year to year. Table 6.12 gives the relevant statistics.

The federal share of health and social welfare expenditures fell from 68.8% in 1962-63 to 57.8% in 1970-71, the provincial share rose from 28.2% to 40.1%, and municipal outlays declined from 3.0% to 2.1%.

Compared with the previous year, 1969-70, health and social welfare expenditures by all levels of government increased by \$1,450 million or close to 17%. This may be compared to the rise of \$1,178 million or 16% in 1969-70 over 1968-69. Expenditures by the federal and provincial governments increased by 14.6% and 20.8%, respectively, from 1969-70 to 1970-71. The main items causing this rise included higher disbursements under the old age security and guaranteed income supplement programs, principally because of the lowering of the eligible age and increase in the monthly benefits paid, the increased expenditures under the Canada Assistance Plan, much higher expenditures under the Unemployment Insurance Act, increases under the Canada Pension Plan, greater outlays for health and welfare for the Indian and Eskimo populations, and constantly rising expenditures under the Hospital Insurance and Diagnostic Services Act, and the Medical Care Act.

The relative federal declines, compared to provincial gains in recent years, have been caused to a substantial degree by increasing hospital expenditures by the provincial government augmented by the effect of the "opting-out" arrangements made available to the provinces. Under the Established Programs (Interim Arrangements) Act, a province may choose to receive contributions from the federal government in the form of a tax abatement and an equalization payment in lieu of a direct federal contribution under the Program. The "opting-out" arrangements have the effect, in this presentation, of showing an increase in provincial government expenditures while the federal fiscal payment is treated not as an expenditure but as a transfer payment. Thus, provincial expenditures include gross outlays by Quebec whereas federal expenditures on health and social welfare do not include the large sums paid or transferred to that province under the Established Programs (Interim Arrangements) Act and other fiscal arrangements.

The proportion of government expenditures on health and social welfare taken up by health programs continues to grow; in 1962-63 such programs accounted for \$1,247 million or 32% of the total and in 1970-71 they amounted to \$4,380 million or 44%.

An outline of the principal federal income maintenance programs for 1970-71 shows the

magnitude of the major programs and services — family allowances payments amounted to \$560 million, old age security payments to \$1.627 million plus another \$280 million under the guaranteed income supplement program, unemployment insurance benefits to \$758 million and veterans pensions and allowances to \$214 million and \$89 million, respectively. In addition, payments under the youth allowances program, which commenced in September 1964, amounted to \$60 million excluding \$22 million under Quebec's schooling allowances program, which is financed by a federal fiscal transfer. In 1967-68 Quebec inaugurated its own family allowances program supplementing the federal scheme (see Section 6.7.4).

Canada Assistance Plan expenditures in 1970-71 were \$391 million. To this should be added an estimated \$200.3 million transferred to Quebec under the Established Programs (Interim Arrangements) Act. Provincial workmen's compensation boards paid out \$230 million in cash benefits for pensions and compensation.

In the field of health, federal grants to the provinces under the Hospital Insurance and Diagnostic Services Act totalled \$734 million. Hospital construction grants to the provinces and municipalities were terminated on March 31, 1970. Provincial expenditures on hospital care were estimated at \$1,825 million and expenditures on other health services at \$990 million. In addition, provincial workmen's compensation boards paid \$75 million for medical aid and hospitalization, and municipal governments spent an estimated \$100 million on health.

**Total and per capita
government expenditure on health and
social welfare, from 1963 to 1971**

6.8.2 Hospital statistics

Canadian hospitals are categorized, for statistical purposes, according to type of ownership — public, private or federal — and type of service — general, allied special (chronic, convalescent, rehabilitation, maternity, communicable diseases, children's or orthopedic), mental or tuberculosis. General hospitals, which account for the largest proportion of beds, are divided into teaching (full and partial teaching) and non-teaching (with and without long-term units) types, which are further subdivided into varying bed-size groups based on rated bed capacity.

Data pertaining to the number of hospitals in operation (Table 6.13), their classification and rated bed capacity (Table 6.14) were available as at January 1, 1972 at the time of preparation of this text but 1970 data were the latest available for all other tables in this Section.

Table 6.13 shows that the number and bed capacity of hospitals operating in Canada have remained relatively stable in recent years.

Table 6.14 gives the number and bed capacity of public, private and federal hospitals operating in Canada in 1971 and 1972, classified by province and by service type. In 1972 public hospitals accounted for 93.8% of total rated bed capacity of all hospitals followed by federal hospitals (3.6%) and private hospitals (2.6%). Corresponding 1971 proportions of 93.7%, 3.7% and 2.6%, respectively, were almost identical. The proportion of rated beds in general and allied special hospitals as a group has been increasing in recent years while rated bed capacity in mental hospitals and tuberculosis sanatoria on the whole has decreased. In 1972, general hospitals accounted for 57.4% of total rated beds as compared to 57.1% in 1971 (5.6 beds per 1,000 population in both years). Provincially, Saskatchewan had the highest ratio of general hospital beds per 1,000 population (7.4) in both 1971 and 1972 while Quebec and Newfoundland reported the lowest ratio with 4.8 in 1971 and 4.7 in 1972. The rated bed capacity of mental hospitals declined from 28.5% of total rated beds in 1971 (2.8 per 1,000 population) to 27.8% in 1972 (2.7 per 1,000 population); allied special hospitals went from 12.8% in 1971 (1.3 per 1,000 population) to 13.4% in 1972 (1.4 per 1,000 population); tuberculosis sanatoria constituted 1.6% in 1971 (0.2 per 1,000 population) declining to 1.4% in 1972 (0.1 per 1,000 population). Rated beds per 1,000 population for all hospitals as a group remained constant from 1971 to 1972 at 9.9.

Total adult and child admissions to all Canadian hospitals increased 4.2% between 1969 and 1970 reaching in excess of 3.6 million or 168.7 patient admissions per 1,000 population. A study of Table 6.15 reveals that admissions to public general hospitals, the major factor in this rise, increased by 4.4% from 1969 to reach almost 3.3 million in 1970; the number of patient admissions per 1,000 population rose from 147.8 to 152.1. Admissions to public mental hospitals increased 3.2% totalling more than 56,800 in 1970 as admissions per 1,000 population went from 2.6 to 2.7. Over the same period, admissions to public tuberculosis sanatoria dropped by almost 20.0% to 6,000, a decline per 1,000 population from 0.4 to 0.3. The average daily population in all Canadian hospitals decreased 0.3% from 178,559 in 1969 to 177,995 in 1970. Public general hospitals made up slightly more than one half (50.7%) of the 1970 average daily population compared with 49.4% in 1969. Public mental hospitals, the second largest group, accounted for 31.0% of the 1970 average daily population as against 32.5% in 1969. There was considerable variation in percentage occupancy by type of hospital in 1970; private mental hospitals as a group recorded the highest percentage occupancy, 98.6%, and public tuberculosis sanatoria the lowest, 55.8%.

The average length of stay of adults and children in public general hospitals decreased from 10.3 days in 1969 to 10.1 days in 1970 (Table 6.16). Average length of stay was significantly correlated to bed capacity in general hospitals, rising from 7.2 days in the 1-to-24-bed group of non-teaching general hospitals to 12.0 days in full-teaching general hospitals with 500 or more beds, a reflection of the fact that larger hospitals tend to provide more diversified and complex services. Provincially, average length of stay for public general hospitals as a group ranged from 8.8 days in Alberta to 10.8 days in New Brunswick and Quebec. Within the allied special group of hospitals there was considerable variation in the average length of stay, extending from 8.7 days for children's hospitals to 14.4 days for the "other" group (maternity, neurological, orthopedic and cancer hospitals) and then climbing sharply to 45.5 days for the convalescent/rehabilitation hospitals and to 219.7 days for

chronic/extended care hospitals. Average length of stay for public general and allied special hospitals as a whole declined from 11.7 days in 1969 to 11.5 days in 1970.

Table 6.17 shows that there were almost 320,000 full-time employees (excluding paid medical staff in general and allied special hospitals) in the Canadian hospital industry as a whole in 1970. This figure represents an increase of over 3,100 full-time personnel from the 316,825 reported in 1969. General hospitals as a group employed 193.4 full-time personnel per 100 rated beds, a decrease from the comparable group ratio of 199.5 recorded in 1969. Provincially, this ratio varied from 145.5 in Saskatchewan to 227.1 in Quebec in 1970. Taken as a group, general and allied special hospitals reported a ratio of 181.0 full-time personnel per 100 rated beds in 1970 compared to 190.6 in 1969. In mental hospitals there were 79.1 full-time personnel per 100 rated beds in 1970, up from the 75.9 reported in 1969, while in tuberculosis sanatoria this ratio was 86.9 in 1970 as compared to 92.9 in 1969. It is interesting to note that over the past few years the hospital industry has made up more than 4.0% of the Canadian civilian labour force, accounting for 4.3% of this total in 1965 and 4.4% in both 1969 and 1970.

Table 6.18 displays the revenues and expenditures of operating public general hospitals for the reporting years 1969 and 1970. Revenues for these hospitals amounted to \$1,895.8 million in 1970 and expenditures were \$1,969.9 million, both amounts representing a 14.0% increase from the comparable 1969 figures. Salaries and wages accounted for 70.4% of expenditures in 1970 while medical and surgical supplies accounted for 3.3% and drugs for 3.1%.

Generally, salaries of hospital nursing personnel were 19.5% higher in 1970 than in 1968 and varied directly according to academic qualifications. For general-duty registered nurses employed in public general hospitals, the average annual salary varied from \$6,475 for those classified as graduate nurse only, to \$9,705 for those with a master's degree in nursing (Table 6.19). Among graduate nurses without additional qualifications in public general hospitals, directors of nursing education received the highest average salary (\$9,423) and general-duty nurses (not registered) the lowest (\$5,776). On the average, general-duty nurses (registered) without additional qualifications employed in hospitals designated "other" (maternity, neurological, orthopedic and cancer hospitals), earned more (\$6,650) than their counterparts in other types of hospitals.

Table 6.20 shows that cost per patient-day was highest for children's hospitals (\$102.24) in 1970, followed by the "other" hospitals group, which includes orthopedic, maternity, neurological and cancer hospitals (\$84.77), and general hospitals (\$59.74). In the provinces, cost per patient-day in general hospitals ranged from \$39.34 in Prince Edward Island to \$74.52 in Quebec.

6.8.3 Morbidity, notifiable diseases and other health statistics

Hospital morbidity. A growing need for additional information on illness in Canada was met in part by a statistical program first undertaken for 1960 involving separations (discharges and deaths) from general and allied special hospitals. The program provided data on primary diagnosis, days of care, length of illness and age composition for all hospital patients except those in mental hospitals and tuberculosis sanatoria. Age, sex and diagnostic information on persons treated in mental hospitals and in tuberculosis sanatoria has been available at the national level for many years but no similar information has been available for persons treated in other kinds of hospitals. About 140 out of every 1,000 persons are hospitalized during a year and, of these, 96 or 97 are treated in general and allied special hospitals.

It should be noted that the picture of morbidity provided by these statistics is not, of course, complete. A total morbidity picture would include not only the morbidity covered by in-patient hospital care but also out-patient morbidity, morbidity covered by treatment outside the hospitals, and morbidity for which no treatment is received. Nevertheless, the illnesses that receive hospital care are, in general, more serious and more important than the illnesses that do not receive hospital care and this, together with the fact that the diagnostic quality of hospital morbidity statistics is very high, makes hospital morbidity statistics a most important source of information. Tables 6.21 and 6.22 present, for 1969, adult and child patients (excluding newborn) in terms of 17 diagnostic categories (Canadian) which consolidate the much more detailed International Classification of Diseases, Adapted.

There were 1.6 million primary operations performed in general and allied special hospitals in 1969. Data are contained in Table 6.23 and 6.24.

Tuberculosis. There were 3,943 new active and 622 reactivated cases of tuberculosis reported in Canada in 1971 — a total of 4,565 cases. Of 9,610 tuberculosis patients being treated at the end of 1971, 1,894 were hospital patients and 7,716 were being treated by drugs on an out-patient basis. In addition, 11,504 persons received preventive out-patient drug therapy as a safeguard against their developing active forms of the disease. Summary information appears in Table 6.25.

Notifiable diseases. The notifiable diseases most predominant in 1971, as in 1970, were venereal diseases (36,897 cases), rubella (12,567 cases), streptococcal sore throat and scarlet fever (10,814 cases), infectious and serum hepatitis (8,784 cases), and measles (7,454 cases). Table 6.26 shows the number of notifications and the rates per 100,000 of all notifiable diseases, by province, in that year.

Cancer. Statistics Canada started a national cancer incidence reporting system on January 1, 1969, in co-operation with the National Cancer Institute and the nine existing provincial tumour registries; a registry has not yet been organized in Ontario. Participating provinces send a simple notification card with basic patient and diagnostic information for each new primary site of malignant neoplasm discovered. Data provided by this system for 1970 are given in Table 6.27.

Therapeutic abortions. The ten provinces and Yukon Territory reported that hospitals under their jurisdictions performed 18,817 therapeutic abortions during the six-month period January to June 1972, 18,801 of them on patients giving Canada as their place of residence. This was 4,629 more than the 14,188 therapeutic abortions during the same six-month period of 1971. In terms of rates per 100 registered live births, the 18,801 therapeutic abortions reported for Canadian residents amounted to 10.1% of live births for the period January to June 1972, as against an abortion rate of 7.6% of live births for the same period in 1971. The number of therapeutic abortions and abortion rates per 100 live births for Canadian residents by province and by quarter during 1971 and 1972 are shown in Table 6.28.

6.9 Veterans services

The Department of Veterans Affairs administers most of the legislation known collectively as the Veterans Charter and also provides administrative facilities for the Canadian Pension Commission, which administers the Pension Act and Parts I to X of the Civilian War Pensions and Allowances Act; for the War Veterans Allowance Board, which administers the War Veterans Allowance Act and Part XI of the Civilian War Pensions and Allowances Act; and for the Secretary General (Canada) of the Commonwealth War Graves Commission.

The principal benefits now available to veterans are medical treatment for those eligible, land settlement and home construction assistance, education assistance for the children of the war dead, general welfare services, disability and dependants pensions and war veterans allowances. The work of the Department, except the administration of the Veterans' Land Act, is carried out through 18 district offices and four sub-district offices in Canada and one district office in England; the benefits of the Veterans' Land Act are administered through seven regional offices and 26 district offices across Canada.

6.9.1 Pensions and allowances

6.9.1.1 Disability and dependants pensions

Canadian Pension Commission. The Canadian Pension Commission administers the Pension Act (RSC 1970, c.P-7) and Parts I to X of the Civilian War Pensions and Allowances Act (RSC 1970, c.C-20). Members are appointed by the Governor in Council who may also impose upon the Commission duties in respect of any grants in the nature of pensions, etc., made under any statute other than the Pension Act. It reports to Parliament through the Minister of Veterans Affairs. The Commission has district offices in principal cities across Canada with a senior pension medical examiner in charge.

The Pension Act. The evolution of Canada's pension legislation can be traced chronologically through special material usually appearing after major modifications in the laws affecting veterans pensions and through the statistical presentations to be found each year in earlier editions of the *Canada Year Book*. The Pension Act was the subject of major modification in 1971 and details of the principal changes are described in subsequent paragraphs within this Section.

The Pension Act makes provision for the payment of pensions in respect of disability or death resulting from injury or disease incurred during or attributable to service with the Canadian Forces in time of war or peace. Provision is also made for supplementing, up to Canadian rates, awards of pension to or in respect of Canadians for disability or death suffered as a result of service in the British or Allied Forces during World War I or World War II, or payment of pension at Canadian rates in cases where the claim has been rejected by the government of the country concerned.

In 1972, the Pension Act and the Civilian War Pensions and Allowances Act were further amended to provide for annual adjustments in pensions and allowances based on the consumer price index. The increase, effective January 1, 1972, amounted to 3.6% and resulted in basic monthly pension awards of \$302.51 for a pensioner suffering 100% disability, and additional allowances of \$82.88 for the wife of the pensioner, \$39.37 for one child, \$29.01 for a second child, and \$22.79 for the third and each subsequent child. Pension awards to widows and dependants were also increased to monthly payments of \$155.40 for a dependent parent, \$227.92 for a widow and additional payments for children or dependent brothers or sisters at the following rates: \$78.74 for one, \$136.75 for two and \$45.58 for a third or subsequent child or dependent brother or sister. It should be noted that, in general, the rates for orphan children or orphan brothers and sisters are double the rates quoted. Pensionable children of widows who have been awarded pensions are paid at orphan rates. Under provisions of the Pension Act, pensions awarded to parents or brothers or sisters may be less than the maximum figures already quoted.

Amendments to the Pension Act (SC 1970-71, c.31), which received Royal Assent on March 30, 1971, provided many extensive benefits for pensioners and broadened the entire structure of pension legislation. Among the major changes was the provision of an allowance which permits, where merited, the grant of an additional amount of not less than \$800 and not more than \$2,400 a year for those 100% pensioners who suffer an exceptional incapacity.

A basic minimum payment equivalent to pension at the rate of 50% was instituted for all ex-prisoners-of-war of the Japanese who have any assessable disability. In addition, deceased prisoners-of-war of the Japanese, whose death occurred prior to the proclamation of the amendments, will be presumed to have been in receipt of pension at an amount equivalent to 50% at the time of death; thus, all qualified widows and orphans of ex-prisoners of the Japanese are assured pension benefits whether or not death was attributable to service.

Other new provisions include: clarification of entitlement to pension for members of the peacetime forces; broadening of entitlement and increased amounts for clothing allowances; additional pension for loss of a paired limb or organ from any cause whatever; provisions for posthumous assessment, where pension was paid at less than 48%, to determine whether the disability was adequately assessed at that time; provision for a widow or child to continue or to initiate an application for pension in respect of a veteran's disability during lifetime on which he had failed to make application — if this claim can be established and if this raises the pension level to 48% or higher, survivor benefits may then be paid; and new adjudicating processes which will permit all claimants whose applications have been rejected in the past to re-apply to the Commission.

The amended Act authorized the establishment of the Pension Review Board, which has the power to determine any questions of law or fact as to an award and the amount of any such award; the decision of the Board is final and binding. The Board is also the responsible body when matters of interpretation of the Act are at issue. A pension applicant who is dissatisfied with a ruling of the Commission may appeal to the Pension Review Board.

The Civilian War Pensions and Allowances Act, Parts I to X, provides for the payment of pensions to or on behalf of persons who served in certain civilian groups that were closely associated with the war effort during World War II and who suffered injury or death as a result of such service; these include merchant seamen, saltwater fishermen, auxiliary services personnel, ferry pilots of the Armed Forces Transport Command, firefighters who served in Britain, etc.

Important amendments were also made to this Act in 1971. The principal change was to remove the requirement — in the case of merchant seamen and certain others who served in civilian status — that application for pension must be made within one year of the occurrence of the disability concerned. The new special provisions for members of the Forces who were prisoners of the Japanese are now also fully applicable to merchant seamen and other designated civilians.

Details as to the number and type of pensions being paid under the Pension Act as at March 31, 1972 are given in Table 6.29.

6.9.1.2 War Veterans Allowances and Civilian War Allowances

War Veterans Allowance Board. The War Veterans Allowance Board is a quasi-judicial body consisting, at present, of ten members appointed by the Governor in Council. The Board administers the War Veterans Allowance Act and Part XI of the Civilian War Pensions and Allowances Act and reports to Parliament through the Minister of Veterans Affairs. The Board acts as an appeal court for an applicant or recipient aggrieved by a decision of a District Authority and may, on its own motion, review and alter or reverse any adjudication of a District Authority. The Board is also responsible for instructing and guiding the District Authorities in the interpretation of policy and for advising the Minister with respect to regulations concerning the administration of the Act.

War Veterans Allowance District Authorities. In 1950, 18 District Authorities were established in the regional districts of the Department of Veterans Affairs and granted full power to adjudicate on all matters arising under the War Veterans Allowance Act. In 1960, a separate authority — the Foreign Countries District Authority — was established to look after recipients living outside Canada. The members of a District Authority are employees of the Department of Veterans Affairs appointed by the Minister with the approval of the Governor in Council.

War Veterans Allowances. The War Veterans Allowance Act (RSC 1970, c.W-5), provides an allowance to otherwise qualified war veterans who, because of age or infirmity, are no longer able to derive their maintenance from employment and to ensure that their income does not fall below a specified scale. Widows and orphans of qualified veterans are eligible for benefits. Since its inception in 1930, the Act has been amended on 16 different occasions to meet additional needs of veterans and their dependants. The Act was last amended on May 19, 1972 when provision was made for an annual escalated increase in the rates and ceilings in accordance with increases in the consumer price index. The rates and ceilings established to take effect on January 1, 1973 provide for monthly payments of \$131 to a single beneficiary, subject to an annual income ceiling of \$2,052; for a married veteran, the allowance is \$217.61 and the ceiling \$3,451.32; for one orphan \$74.70 and \$1,184.40, for two orphans \$131.00 and \$1,920.00 and for three orphans \$176.47 and \$2,441.64. It should be noted that the ceiling for permissible annual income is raised by \$120 a year if the recipient or spouse is blind.

As at December 31, 1972 a total of 74,719 persons were receiving War Veterans Allowances: 43,875 veterans, 30,518 widows and 326 orphans. Of the total number of beneficiaries, only 683 resided outside Canada. Annual liability for all recipients was estimated at \$77.6 million.

Civilian War Pensions and Allowances. Part XI of the Civilian War Pensions and Allowances Act makes available to certain groups of civilians and their widows and orphans, benefits similar to those available to veterans under the War Veterans Allowance Act. These groups, which performed meritorious service in World War I or World War II, are: Canadian merchant seamen of both wars; non-Canadians who served in Canadian merchant ships in either war; Canadian voluntary aid detachments of World War I; Canadian firefighters of World War II; Canadian welfare workers of World War II; Canadian transatlantic aircrew of World War II; and the Newfoundland Overseas Forestry Unit of World War II.

At December 31, 1972, 2,638 civilians, 651 widows and 12 orphans were in receipt of Civilian War Allowances, for a total of 3,301 of whom only five resided outside of Canada. Annual liability was estimated at \$4.7 million.

6.9.1.3 Bureau of Pensions Advocates

The Bureau of Pensions Advocates was established under the Minister of Veterans Affairs by the amendments to the Pension Act 1971 (SC 1970-71, c.31), effective March 30, 1971. It succeeds the Veterans Bureau which had been in operation since 1930. The Bureau is not part of the Department of Veterans Affairs, but provides an independent professional legal aid service to applicants for awards under the Pension Act. The Chief Pensions Advocate is the Chief Executive Officer and is assisted by pensions advocates, all of whom are lawyers, located at the Bureau's head office in Ottawa and in district offices in major centres across Canada. Pensions Advocates represent applicants as counsel at Entitlement Board and Pension Review

Board hearings and provide a general counselling service to applicants relative to their claims under the Pension Act. No charge is made for the services of the Bureau.

Statistics are not available for the new Bureau of Pensions Advocates but in its last year the Veterans Bureau presented 5,736 claims to the Canadian Pension Commission for adjudication of which 42% were wholly or partially granted.

6.9.2 Welfare and treatment services

6.9.2.1 Welfare services

Welfare services for veterans and, where appropriate, their dependants are provided by the Welfare Services Branch. These include the administration of assigned statutes; the conducting of field work and reporting for other branches of the Department, and the Canadian Pension Commission, the War Veterans Allowance Board and Services Benevolent Funds; and the provision of a rehabilitation and welfare program of advice and counselling including referral, where indicated, to other public or private agencies, veterans organizations, etc.

Assistance fund. Recipients of benefits under the War Veterans Allowance Act and Part XI of the Civilian War Pensions and Allowances Act living in Canada may be given help from the assistance fund if their total income is lower than the permitted maximum. Assistance may take the form of a monthly supplement based on shelter, fuel, food, clothing, personal care and specified health costs or of a single award to meet an unusual or emergency need. The number of persons assisted in the year ended March 31, 1972, was 21,728, the number in receipt of monthly supplements at the end of 1972 was 17,471 and fund expenditures to March 31, 1972, amounted to \$8.3 million.

Education assistance to children. The Children of War Dead (Education Assistance) Act provides help in the form of allowances and the payment of fees for the post-secondary education of children of persons whose deaths have been attributed to military service. Assistance is restricted to children attending, in Canada, educational institutions that require secondary school graduation, matriculation or equivalent standing for admission, including, in addition to universities and colleges, such facilities as hospital schools of teaching and institutes of technology. From its inception in July 1953 to March 31, 1972, expenditures totalled \$10.9 million of which \$6 million was spent in allowances and \$4.9 million in fees. By the end of March 1972, training had been approved for 5,854 children of Canada's war dead; of these, 2,557 had successfully completed training. At the same date, there were 877 students in university and non-university courses receiving assistance.

Veterans insurance. Under the terms of the Returned Soldiers Insurance Act (SC 1920, c.54 as amended), any one veteran of World War I became eligible to contract for life insurance with the federal government for a maximum of \$5,000. No policies have been issued under this Act since August 31, 1933. During the eight years in which the Act was open, 48,319 policies with a face value of \$109.3 million were issued. On December 31, 1971, 3,865 policies with a value of \$8.4 million were still in force.

The Veterans Insurance Act (RSC 1970, c.V-3) made life insurance up to a maximum of \$10,000 available to veterans of World War II on their discharge as well as to widows of those who died during that war. The Veterans Benefit Act of 1954 extended this eligibility to veterans with active service in Korea. The period of eligibility to apply for this insurance ended October 31, 1968. By that date 56,148 policies amounting to \$185.1 million had been issued and, of these, 22,745 policies with a value of \$73 million were still in force on December 31, 1971.

Rehabilitation and welfare. Welfare officers at district offices work closely with other branches of the Department, with other public agencies at all levels and with private agencies and organizations in assisting veterans and their dependants to deal with problems of social adjustment, particularly those associated with physical disabilities or the disabilities of increasing age. The latter occur more frequently, of course, as the age of the veteran population increases. A program of university, vocational, technical and home training with allowances, is provided for disabled pensioned veterans and vocational rehabilitation is also promoted by training assistance. Sheltered workshops at Toronto and Montreal and home assembly work in other centres produce poppies and memorial wreaths associated with Remembrance Day observances.

Services benevolent and welfare funds. Veterans and their dependants receive considerable assistance through various services benevolent funds. All of these organizations work closely together and in co-operation with the Department of Veterans Affairs and veterans organizations. In addition to providing cash grants or loans as detailed below, all organizations for serving or ex-service personnel carry out increasingly heavy counselling work, particularly in the field of debt consolidation and management.

The oldest of the services funds, the Royal Canadian Navy Benevolent Fund, was incorporated in 1942 and derived its original capital from undistributed prize monies accrued during World War I. In the year ended March 31, 1972, it approved 383 applications for loans or grants totalling \$204,628. The Royal Canadian Air Force Benevolent Fund was established in 1944 using assets from disbanded units of the Commonwealth Air Training Plan. Loans or grants totalling \$301,838 were made in 1,214 cases during the year ended March 31, 1972. The Army Benevolent Fund was set up by Act of Parliament in 1947 and is administered by a Board appointed by the Governor in Council. It is the only one of the Funds required to report annually to Parliament (through the Minister of Veterans Affairs). Capital for this Fund was derived from army canteen and mess funds accumulated during World War II. No provision was made in its charter for loan assistance and it is further restricted in that its operations extend only to persons who were on active service in the Canadian Army during World War II and their dependants. During the year ended March 31, 1972, 3,692 cases received \$417,494 in grants under its Veterans Welfare Programme.

In 1950, the Canadian Army Welfare Fund was incorporated to make assistance available to personnel (and their dependants) enlisting in the Army after World War II and who were thus ineligible for help under the three existing Funds. While addressing itself primarily to the small-loan field for serving personnel, an amount of \$50,000 is set aside annually for distress grants. Following unification of the Forces, and because of a variety of legal complications precluding amalgamation of the existing Funds, a fifth, the Canadian Forces Personnel Assistance Fund was incorporated. Its primary role at the present time is in the field of small low-cost loans for serving personnel enlisting after February 1968. The grant and financial distress loan aspects of this program are expected to take on increasing importance as the years pass. Administration of the two last-named Funds is carried out on contract through the office of the Army Benevolent Fund Board.

6.9.2.2 Treatment services

The Treatment Services Branch of the Department of Veterans Affairs provides medical and dental services for entitled veterans throughout Canada as well as for members of the Armed Forces, the Royal Canadian Mounted Police and the wards of other governments or departments at the request and expense of the authorities concerned. Prosthetic services are provided to entitled veterans by the Department of National Health and Welfare but paid for by the Department of Veterans Affairs (DVA).

The Branch provides examination and treatment for pensionable disabilities, and provides treatment to war veterans allowance recipients (but not to their dependants) and veterans whose service and financial circumstances render them eligible for free treatment or at a cost adjusted to their ability to pay. If a bed is available, any veteran may receive treatment in a departmental hospital on a guarantee of payment of the cost of hospitalization. The pensioner receives treatment for his pensionable disabilities regardless of his place of residence but service to other veterans is available in Canada only. Subject to the approval of the Department, an eligible veteran may also obtain treatment at the expense of the Department in an outside hospital from a doctor of his choice. Domiciliary care may be provided to eligible veterans in departmental facilities where the need for active or chronic treatment is sufficiently light, provided that excess beds are available.

Under the federal-provincial hospital insurance program, DVA hospitals are recognized for the provision of insured services to veterans. Where treatment is given for a non-pensioned condition at a DVA hospital to a veteran, or elsewhere to a veteran eligible under the veterans treatment regulations, the hospitalization is an insured service under the federal-provincial hospital insurance program and his medical care is an insured service under the federal-provincial medical care insurance program. The Department pays premiums where required on behalf of veterans who are eligible for war veterans allowance.

Hospital facilities. Treatment is provided in eight active treatment hospitals located at Halifax, NS; Montreal and Ste. Anne de Bellevue, Que.; London, Ont.; Winnipeg, Man.; Calgary, Alta.; and Vancouver and Victoria, BC; and in three domiciliary care homes at Ottawa, Ont., Saskatoon, Sask. and Edmonton, Alta. The rated bed capacity of these institutions at December 31, 1970 was 6,005 beds. It should also be noted that in Ottawa both acute and chronic cases requiring definitive treatment are admitted to the National Defence Medical Centre. A veterans pavilion of 67 beds is located at St. John's General Hospital, St. John's, Nfld., 1,200 beds are available at Sunnybrook Hospital in Toronto, 150 beds at the Centre Hospitalier de l'Université Laval in Quebec and 200 beds at West Saint John Community Hospital in Saint John, NB, for the priority use of veterans, as well as some 500 beds in community hospitals located in St. John's, Nfld., Charlottetown, PEI, Kingston, Ont., Regina and Saskatoon, Sask. and Edmonton, Alta.

Medical staff and training programs. The active and consulting medical staffs of departmental hospitals are usually private practitioners and specialists who also hold teaching appointments on the medical faculties of local universities. Their appointment and selection is normally recommended by the Deans of Medicine of the universities with which the departmental hospitals are affiliated. This affiliation results in approval by the Royal College of Physicians and Surgeons of Canada for postgraduate teaching in resident teaching programs of non-core years in medicine, surgery, psychiatry and other specialties. Some departmental hospitals are also affiliated with technical schools and act as hospital teaching units in technical school programs for paramedical sciences such as laboratory and radiology technicians. In addition, residency training programs are given in psychology, dietetics, physiotherapy and occupational therapy, and in the medical social services at both the undergraduate and graduate levels. A postgraduate residency program in hospital pharmacology and pharmacy methodology is conducted at Westminster Hospital, London, Ont. At Camp Hill Hospital in Halifax, Shaughnessy Hospital in Vancouver, Deer Lodge in Winnipeg, and Westminster Hospital in London, the Department is affiliated with the university medical school in the undergraduate clinical teaching program, in addition to participating in graduate residency training.

6.9.3 Land settlement and house construction

The Veterans' Land Act, 1942, as amended, provides financial, technical and supervisory assistance to World War II and Korean Force veterans, to enable them to engage in agriculture or commercial fishing on a full-time basis; to acquire, build or improve homes; and to settle on provincial, federal and Indian reserve land. Loans may be made of up to \$40,000 for full-time farmers on economic farm units, to \$18,000 for small family farmers, to \$16,000 for small holders (part-time farmers) and to \$18,000 for veterans building houses on city-size lots. The financial assistance available under the Act is generally comparable to that available to non-veterans under the Farm Credit Act and the National Housing Act.

From inception of the Act to December 31, 1972, 129,603 veterans were settled under the provisions of the Act; 31,477 were established as full-time farmers, 84,897 as small holders, 5,684 as Crown land settlers, 1,426 as commercial fishermen, 1,781 Indian veterans were established on reservations and 4,337 veterans acted as their own contractors in building homes on city-size lots. Subsequent to settlement, 19,294 farmers and 18,246 small holders and commercial fishermen were given additional loans. In 1972, loans amounting to over \$49.8 million were approved on behalf of 3,302 veterans. From inception of operations to the end of 1972, \$1,146.4 million was spent on repayable loans, advances and non-repayable grants and 67,775 veterans had earned conditional grants of \$121.1 million. By the end of that year, 53,208 of them had successfully completed their settlement contracts — 17,410 farmers, 28,729 small holders, 683 commercial fishermen, 4,722 Crown land settlers, and 1,664 Indian veterans on reservations.

Field officers, highly trained in the techniques pertaining to agriculture, construction and land appraisals, provide advisory, supervisory and appraisal field services. During 1972, 3,631 properties were appraised, including 184 for the Indian Off-Reserve and Eskimo Housing Program and 51 special assignments carried out on behalf of other government departments and agencies. Altogether, 578 new houses were started — 562 for small holders and commercial fishermen, nine farm homes and seven on city-size lots — and 586 new houses were completed.

During the fiscal year 1970-71, instalments falling due on properties purchased by veterans under the Act amounted to \$39.7 million, excluding share-of-crop payments; over 92.1% of the total amount due was collected and 773 veterans under share-of-crop agreements paid \$1.6 million.

By December 31, 1972, 18,335 veterans were insured under Veterans' Land Act group life insurance for \$185.3 million. Since inception of the group plan, 376 insured veterans have died and \$2.8 million has been spent to pay off their loans.

6.9.4 Commonwealth War Graves Commission

The current Charters of the Commonwealth War Graves Commission consist of two documents — the Original Charter of Incorporation dated May 21, 1917, and the new Supplemental Charter dated June 8, 1964. Under these Charters the Commission is entrusted with the marking and maintenance in perpetuity of the graves of those of the British Empire and Commonwealth Armed Forces who lost their lives between August 4, 1914 and August 31, 1921, and between September 3, 1939, and December 31, 1947, and with the erection of memorials to commemorate those with no known grave.

The Canadian High Commissioner in London, England, is the official Commission member for Canada and the Minister of Veterans Affairs is the Agent of the Commission in Canada. The office of the Secretary-General of the Canadian Agency is in the Veterans Affairs Building, Ottawa.

¹ Excludes Yukon Territory and Northwest Territories from 1901 to 1951.

² Estimates for 1962 to 1968 for interns and residents are based on Statistics Canada data, and for other active civilian physicians, on the data of *List catalogue*, Canadian Mailings Limited (Seccombe House).

³ Population-physician rate calculated on the basis of Statistics Canada estimates of the population as at Jan. 1 of the following year.

⁴ Produced by the Department of National Health and Welfare from information supplied by Medical Marketing Systems Limited (Seccombe House).

Chapter 7

Education

7.1 Current developments

The cost of education in Canada for 1970 has been estimated at \$7,409 million, an amount representing almost 9% of the gross national product (GNP); by comparison, the cost of education in 1960 represented only 4.3% of the GNP. During the 1960s, school and university enrolment increased by 50% and staff by 70%, and by 1970, it was estimated that approximately 30% of the entire population of Canada was either receiving or dispensing education.

In the past decade Canada's administrators in the field of education have become increasingly aware of the need for young people to receive the types of education that will prepare them for their future careers; for professional, technological and cultural education to be diversified and of a high standard; and for the provision of equal educational opportunity for each individual regardless of socio-economic status, sex, ethnicity or location. The necessity of assuring equality of opportunity and of providing diversified programs has led education planners to offer a wide choice of courses at all levels of education. At the elementary and secondary levels, courses are included on fine arts, music, drama, urban planning, social geography and man in society. Community colleges and vocational institutions provide a widening range of advanced technological and para-professional courses. Universities offer varied interdisciplinary programs at the undergraduate and graduate levels and some have instituted programs of Canadian studies.

At the post-secondary non-university level, a proliferation of new structures has evolved. The most innovative type of institution that emerged across the country in the 1960s is generically known as the "community college". For example, in Quebec there are now about 35 colleges of this type, many of them formerly operated by religious communities. They are now known as *collèges d'enseignement général et professionnel* and are commonly referred to as CEGEPs. There are also about 20 private classical colleges in the province, some of which will undoubtedly be absorbed into the CEGEP group within the next few years. In Ontario, colleges of applied arts and technology (which incorporated the former institutes of technology and the provincial vocational centres and are known as CAATs) were set up in 1967 in 20 regions. This upsurge in the establishment of additional post-secondary vocational and technological institutions has occurred all across Canada. The institutions are evolving to meet the labour market's increasing need for qualified technicians and the students' need for diversified education.

Another significant change in education is the greater accessibility of programs to students regardless of sex. Females, who constituted about 36% of the full-time university and community college enrolment in 1971-72, are increasingly selecting, and being selected for, certain post-secondary courses which previously had shown almost total male enrolments. For instance, more women are now studying architecture and urban planning, engineering and applied sciences, dentistry, law and pharmacy, and a few women are enrolled in such courses as electronics and forestry. At the same time, male students are selecting courses which were formerly the preserve of females, such as nursing, social work, library science, dietetics and nutrition, and especially education. As education and occupations previously designated as male- or female-oriented become more open to both sexes, the choice of occupation will become increasingly more dependent on interest and ability regardless of sex. A major determinant in this transition is the continuing change in the cultural definitions of male and female work.

Further changes in Canadian education have been brought about by the realization that adjustments had to be made to accommodate variations in interest and abilities of students in different subjects. This has resulted in a drastic revision of policies to include non-graded systems, subject promotion, changes in methods of examination and the extension of guidance facilities.

One of the notable increases in teaching facilities is in the area of library service. A Statistics Canada survey showed that, in the school year 1968-69, school libraries increased their stocks of books by nearly 8 million. These libraries provide up-to-date reference books on all subjects in the school curricula and have assumed increasing importance as resource centres for audio-visual aids such as projectors, films, filmstrips, maps, tapes and records.

Efforts are also being made to overcome the financial barriers to continuing education. Investigations by demographers and sociologists confirmed the long-held suspicions that financial constraints were denying advanced education to many Canadians who could profit from it. Consequently, various methods have been tried to lighten the financial burden on the individual and to equalize the rapidly increasing load being carried by the taxpayer. The federal government is assuming an increasingly prominent role in the education field, particularly in regard to the retraining program of the Department of Manpower and Immigration involving adult technical and vocational training, as well as in post-secondary education and university education, all matters of prime concern to the nation as a whole.

7.2 Administration and organizational structure

7.2.1 Responsibility for education

7.2.1.1 Federal responsibility

Canada is a federal state, in which responsibility for the organization and administration of public education is exercised by the provincial and territorial governments. The federal government is directly concerned only with schools for Indian children which are administered by the Education Branch of the federal Department of Indian Affairs and Northern Development, with schools for children of servicemen operated in Europe by the Department of National Defence, and with schools for inmates of federal penitentiaries. In addition, the federal government finances retraining of adults, provides financial support to the provinces amounting to at least 50% of operating costs of post-secondary education, participates to a considerable extent in informal education, and makes grants-in-aid for research personnel and equipment in universities. More detailed information on federal responsibility for education is given in Sections 7.2.2 and 7.2.5.

7.2.1.2 Provincial responsibility

Each of the ten provinces and the two territories has the authority and responsibility for organizing its education system as it sees fit and, as a consequence, organization, policies and practices differ from one to the other. Each has a department of education or of education and youth, headed by a Minister who is a member of the Cabinet in the case of the provinces or responsible to the Council in the case of the territories; Ontario has a Ministry of Colleges and Universities, Manitoba a Department of Colleges and Universities Affairs and Alberta a Department of Advanced Education. Each provincial department is administered by a Deputy Minister who is a professional educationist and a public servant. He advises the Minister, supervises the department and gives a measure of permanency to its education policy and, in general, carries out that policy and is responsible for the enforcement of the Public School Act. The department of education usually also includes a chief inspector of schools and a staff of local inspectors, as well as directors or supervisors of curricula, technical education, teacher training, home economics, guidance, physical education, audio-visual education, correspondence instruction, adult education, other specialized sections according to the needs of the particular province, and technical personnel and clerks.

Other provincial departments having some responsibility for operating school programs include departments of labour which operate apprenticeship programs, agriculture departments which operate agriculture schools, departments of attorney-general or of welfare which operate reform schools, and departments of lands and forests which operate forest ranger schools.

From the beginning, each department of education has undertaken, among other things, to provide: inspection services to ensure maintenance of standards; teacher certification; courses of study and lists of prescribed or approved textbooks; financial assistance to local authorities in the construction and operation of schools; and guidance regulations for trustees and teachers. In return, each department requires regular reports from the schools. When first introduced, government grants to schools were based on such factors as number of teachers, enrolment, days in session and attendance. Somewhat later, special grants were introduced in most provinces to meet a variety of expenditures, such as construction of a first school, organization of special classes, transportation of pupils, school lunches and other contingencies. A number of provinces made provision for equalization grants and now most of them have a foundation program of one kind or another.

The work of the departments of education has grown considerably. Many have expanded

their services in the fields of health, audio-visual aids, art, music, agriculture, sociology, special education, correspondence courses and pre-vocational and trade courses. At the same time there has been an increasing delegation of authority to local boards and school staffs. One illustration of this tendency is a reduction in the number of departmental (external) year-end examinations. Few provinces now provide for more than one or two such examinations – at the end of the final and, in some cases, at the end of the second-to-last year of the secondary school course. Another illustration is the increasing use of lists of approved textbooks from which local authorities may make their own choice, instead of lists of prescribed texts. Courses of study are now seldom planned by only one or two experts in the department; instead, they result from conferences and workshops including active teachers and other interested individuals or bodies. In most provinces “curriculum construction” is considered to be a continuous procedure.

7.2.1.3 Elementary and secondary schools

In all provinces schools are established and operated by local education authorities functioning under the terms of a Public School Act and held responsible to the provincial government and resident ratepayers for the actual operation of the local schools. Through the delegation of authority, education has become a provincial-local partnership with the degree of decentralization reviewed intermittently.

Elementary and secondary schools may be classified as publicly controlled or private. The publicly controlled schools, sometimes referred to as “public” schools (including separate schools), encompass those that operate under the provincial school system with locally appointed or elected school boards. Private schools generally either provide a similar curriculum to that of publicly controlled schools or concentrate on business, commercial, trade, technical and correspondence courses, or provide a combination of such courses.

Under recent amendments to provincial legislation, school units have been consolidated and consequently enlarged in all provinces. With the growth of cities and towns and of educational facilities and requirements, the old-time three-member local school board became inadequate as an administrative structure. The original school boards remained as units but provision was made for urban school boards consisting of more members, responsible for both elementary and secondary schools and for providing the necessary staff, buildings, equipment and transportation. The local boards still in existence in some districts have limited powers and duties, usually functioning in an advisory capacity and looking after buildings and grounds.

7.2.1.4 Community colleges

Although there are some privately operated colleges, the provinces are partially or totally responsible for co-ordinating, regulating and financing community colleges and related institutions. Some provincial governments completely finance these colleges while others do so in part. Similarly, the degree of local autonomy given the colleges varies by province.

Since 1960, Alberta, British Columbia, Ontario and Quebec have established new community college structures. In Alberta, the provincial agency is the Alberta College Commission composed of nine members, all appointed by the government. In British Columbia, an advisory board – the Academic Board – serves both universities and colleges and consists of nine members, six appointed by the university and three by the provincial government. In Ontario, the administration of community colleges is carried out by the Ministry of Colleges and Universities. In Quebec, the Department of Education is responsible for many agency functions. The composition of governing boards varies by province; for example, in Quebec, it consists of 19 members including representatives from the university, the principal and academic dean, students and parents of students.

7.2.1.5 Universities

There are distinctive differences in Canadian systems of higher education. The universities and colleges long ago established by the French were based on the culture of Old France and were administered by Roman Catholic groups, either religious or secular. These French-language institutions still retain their traditional characteristics but now conform almost entirely to the North American system of administration. The largest group of universities and colleges in Canada is administered by English-speaking staff and offers instruction in English. Apart from those founded and still administered by various Protestant religious groups, these institutions are mainly non-denominational, having been established through private subscription or by the provincial government concerned.

Civil legislation regarding the establishment of new institutions or changes in existing ones is usually enacted by provincial legislatures, except for federal military colleges and a few institutions originally established by Act of the Canadian Parliament. Once an institution is legally chartered, control is vested in its governing body, the membership of which is indicated in the charter. The line of authority runs from the board of governors through the president (or rector) to the senate and deans and the faculty as a whole. The composition of the board of governors varies according to the type of institution. Provincial universities normally have government representation; church-related institutions have clergymen. Nearly all boards have either direct representation from the business community, alumni associations and other organizations, or are advised by these groups through advisory boards or committees. A recent phenomenon has been the inclusion of students on administrative bodies. The size of the board varies from a very few to over 60. It has ultimate control of the university and normally reserves to itself complete financial powers, including the appointment of the president and most other staff. On occasion there will be faculty representation on the board and recently there have been attempts on the part of faculty groups of many institutions to obtain greater representation on the boards of governors. Responsibility for academic affairs is usually delegated to the senate. Composed mainly of faculty members, although there may also be alumni and representatives of non-academic groups included, the board is responsible for admission, courses, discipline and the awarding of degrees.

7.2.2 Levels of education

7.2.2.1 Pre-grade 1, elementary and secondary education

Pre-grade 1 enrolment in schools offering elementary-grade instruction is neither compulsory nor universal throughout Canada, although kindergartens for five-year-olds are part of the elementary school system in large urban centres in most provinces. Recently, an increasing number of kindergartens are accepting four-year-olds. There are also some kindergartens which are run by private individuals and which accept children of three to five years of age.

Each September, most Canadian six-year-olds enter an eight-grade publicly controlled (including separate) elementary school. At about 14 years of age, a significant proportion of those who entered grade 1 move on to a four- or five-year secondary school. Less than 3% of the elementary and secondary students in Canada attend private schools.

The 8-4 plan leading from grade 1 to university was for many years the basic plan for organizing the curriculum and schools other than those under the jurisdiction of the Catholic school boards of Quebec. This plan, although still followed in some school jurisdictions, has been modified from time to time in all provinces, cities or groups of schools. There are a number of variants to be found in Canada at present: the addition of one or even two years of secondary schooling; the introduction of junior high schools, changing the organization to a 6-3-3 or 6-3-4 plan; or, the combining of the first six years of elementary school into two units, each designed to reach specified goals during the three-year period. In the recently established community colleges, the last one or two years of high school and the first one or two years of college are offered.

At the secondary level, three programs can generally be distinguished — the university entrance course, the general course for those wishing to complete an academic type of program before entering employment, and vocational courses for those wishing to enter skilled trades or pursue further training in the technological fields. However, in recent years changes in the curricula have allowed the student greater flexibility in program selection.

Secondary schools were at one time predominantly academic and prepared their pupils for entry into university. Until recently, vocational schools were to be found only in the large cities, although schools in some of the smaller centres did provide a few commercial and technical subjects as options in the academic curriculum. Today, in addition to the vocational schools and the regular secondary schools providing commercial courses, there are increasing numbers of composite and regional high schools offering regular academic subjects and vocational training in such courses as home economics, agriculture, shop-work and commercial subjects. Occupational or pre-employment classes, set up as part of the total program in regular vocational schools, require from one to three years or even four years for completion, and are terminal in nature. In addition to this type of course, some schools offer special, ungraded one- or two-year vocational programs to students who have completed the

final years of high school. Some secondary schools also provide occupational programs for students who have shown no particular aptitude for an academic education or for training in a specific trade. These students learn no specific trade until perhaps their third year of studies. By remaining in school longer, however, they adjust more easily to conditions in the work world.

7.2.2.2 Special education

There is increasing interest in the education of exceptional children. For gifted children, innovative, enriched and accelerated programs are being developed at both the elementary and secondary levels. New types of special classes are sometimes started by parents of children with a common disability, who band together to provide help and show the need for such service, which may then be taken over by public bodies. Progress in providing such education varies from province to province and is most commonly found in city school systems. There are six schools for the blind, 16 schools for the deaf, and a number of training schools for mental defectives. Special classes are conducted in tuberculosis sanatoria, mental hospitals and reformatories.

7.2.2.3 Trade and technical education

Increasing use of automated processes in business and industry is resulting in a shrinking market for unskilled and semi-skilled workers. Early school dropouts are finding it increasingly difficult to get suitable employment and many are trying to acquire in their adult years the general education or training in the skilled trades that they missed in their youth. Persons still in the regular school system are tending to remain longer and go farther in the system, partly because of the changing attitudes of society toward education and partly for economic reasons.

To meet this growing demand for better educational facilities, educators are striving to provide comprehensive programs at all levels to satisfy the needs not only of the university-bound but also of the great majority who require adequate preparation for early entry into the labour force. It is now accepted that vocational education for adults as well as for youths is a public responsibility that must be made available, as needed, throughout the person's working life. Education of this nature is of national concern and has a direct impact on material prosperity, the economy and the standard of living.

The pattern of vocational education in Canada varies from province to province and there are variations within the provinces. However, there are three basic types of institutes offering vocational education: secondary schools, trade and occupational training schools and post-secondary institutes of technology. Many municipal school boards provide vocational courses as part of the regular secondary school program in technical or composite-type schools. Students in these schools get some general vocational training or training in certain specific fields, such as typing or auto mechanics, along with instruction in general academic or cultural subjects.

Trade and occupational training schools, on the other hand, are open only to those who have passed the provincial school-leaving age and have left the regular school system. These schools offer specialized training and their purpose is to develop competent people for a wide variety of occupations. Courses at the trade level do not usually require high school graduation; the grade level demanded, which varies according to province or trade, ranges from grade 8 to grade 12.

The third type, the institutes of technology, operate at a higher level of training. Enrolment in the institutes presupposes high school graduation or at least high school standing in such relevant subjects as mathematics and the sciences. Graduates from institutes of technology are awarded diplomas of applied arts or diplomas of technology and form an essential link between professionals on the one hand and qualified craftsmen on the other. Most of the institutes of technology and trade schools across Canada are provincially operated.

In addition to the vocational education and training provided by these three types of publicly operated schools, many private business colleges and trade schools offer a wide variety of business, trade and technical courses, some through correspondence. Vocational education is also carried out under a system of apprenticeship training. Such training is given mainly on the job, with classes taken at the trade schools either during the evening or on a full-time basis during the day for periods ranging from three to ten weeks a year.

7.2.2.4 Tertiary education

Community colleges and related institutions provide post-secondary education in various programs that enable students to proceed to university with credit of up to three years of university study, or undertake technical/vocational training in programs of up to four years in duration, leading to the occupational level of the skilled technologist.

Entry requirements involve secondary graduation but in some institutions a "mature student" status is used to enable promising but otherwise ineligible students to enter. Qualifying programs are also offered to help students overcome academic deficiencies.

Programs offered in the technical/vocational sphere are widely diversified and reflect the manpower requirements of the college region. Other programs offered are: business administration, applied arts, health sciences and a wide variety of technologies such as architectural, mechanical, electrical, chemical and resource. Many of these colleges also offer both credit and non-credit programs in continuing education.

There were approximately 150 institutions offering college-level programs in Canada in 1971-72. The Atlantic Provinces had 12 colleges as follows: the College of Fisheries and the College of Trades and Technology in Newfoundland; Holland College in Prince Edward Island; two marine institutes, two technical institutes, a land survey institute and an agricultural college in Nova Scotia; and two technical institutes and a forest ranger school in New Brunswick. Quebec had a total of 68 colleges including 35 CEGEPs (*collèges d'enseignement général et professionnel*), 29 private colleges and several other colleges operated by departments other than education. In Ontario there were 26 CAATs (colleges of applied arts and technology), four agricultural colleges, three regional medical laboratory institutes, one college of art, one chiropractic college and one school of horticulture.

The western provinces had 34 colleges as follows: Manitoba, three community colleges; Saskatchewan, two public colleges and two private colleges; Alberta, six community colleges, three agricultural and vocational colleges, two technical institutes and two private colleges; and British Columbia, nine community colleges, two schools of art, two private colleges and one technical institute.

7.2.2.5 Nursing education

Traditionally, nurses' (RN) diploma courses have been conducted in hospital schools. In 1964, Ryerson Institute of Technology became the first non-hospital institution in Canada to include nurses' diploma training and since then there has been a definite trend toward giving the theoretical part of the instruction in community colleges and providing only the practical instruction in hospitals. Several provinces — Quebec, Saskatchewan, Alberta and British Columbia — offer nurses' training in non-hospital schools. Ontario has a network of regional schools of nursing which are neither part of the general education system nor under the administration of hospitals.

Another trend in nursing education is a shortening of the course from three years to two, except in Quebec where the three-year training period will remain (according to present plans) with the first two years spent in CEGEPs and the third in hospital to gain "polytechnical" training.

In addition to nursing education solely at the post-secondary non-university level, students receiving their nurses' (RN) diploma in hospital schools may qualify for a degree on completion of the necessary additional one- or two-year course or longer (depending on the institution) offered by some universities. Further, undergraduate and graduate degrees are offered to students who enter university directly from secondary school.

7.2.2.6 Teacher training

All provinces require candidates for elementary school teaching certificates to have high school completion or better, with at least one year of professional training in a faculty of education or a teachers' college. The training usually consists of professional and academic courses and some time spent in practice teaching. High school teachers are generally university graduates who have taken an additional year of professional training in a college of education, or who have graduated with a degree in education. The trend is for departments of education to delegate to universities the responsibility for training elementary school teachers as well as secondary school teachers.

In all provinces except Nova Scotia, Quebec and Ontario, all teacher training is conducted at the university level where three or four different courses leading to a degree are provided;

about three quarters of the time is devoted to academic courses in arts and science and the remainder to professional courses. Teachers' colleges still exist in these three provinces but are generally disappearing as independent institutions. In Nova Scotia, there is no plan to integrate its one teachers' college with the university, but an optional third year will be included in the program which currently requires two years after senior matriculation. Five universities also offer degree programs in education. The pattern in Quebec is for students to first complete the two-year academic program in a CEGEP and then continue their teacher training at university. Sixteen *écoles normales* have been absorbed by other institutions since 1969-70 and only five are still in operation. In Ontario, only eight teachers' colleges remain, and it is expected that by 1973-74 only persons holding a university degree will be accepted for teacher training.

7.2.2.7 University education

This level of education includes universities and colleges. A university may be defined as an institution of post-secondary education, professional training and research which grants first and advanced degrees; a college is an institution with usually only one faculty granting a first degree but is more likely to be affiliated with a degree-granting university. To qualify for entrance into university, students must have high school graduation (11 to 13 years of schooling depending on the province) or equivalent standing. In Quebec the new "collegial" program requires two years of CEGEP training before entering university. An applicant who lacks the usual academic qualifications may gain admittance to university after reaching a certain age by passing entrance examinations and being assessed as a "mature" student.

Courses of instruction ranging in duration from three to five years (in Quebec a minimum of five years from high school graduation) lead to a bachelor degree in arts, pure science and such professional fields as agriculture, engineering, business administration, pharmacy, nursing and education. Courses in law, theology, dentistry, medicine and some other fields are longer — usually requiring for admission completion of part or all of a first-degree course in arts or science. For those pursuing graduate studies and research, the second degree is normally the master's or licence (at least one year beyond the first degree) and the third is the doctorate (normally requiring at least two additional years beyond the second degree).

7.2.2.8 Continuing education

A relatively new phenomenon in Canadian education is the growth of continuing education, sometimes referred to as adult education. The provision of evening and summer extension and correspondence courses in a wide variety of subjects is now an important part of the education system. Diversified programs of study for adults through correspondence and extension courses are offered by school boards, provincial government schools, private trade schools and business colleges, business and professional associations, community colleges and related institutions, and universities. As a result of this activity in adult education, men and women who find it impractical or impossible to attend full-time or regular classes because of business and family responsibilities, illness or inaccessibility to schools are able to pursue accreditation at diverse educational levels or to advance their personal interests. Correspondence course study provides instruction to children and adults confined to home or hospital and to inmates of Canadian correctional institutions.

School boards, universities and community or regional colleges offer courses leading to formal accreditation as well as courses reflecting individual and community interests. Recent surveys of school boards and universities indicate that some 288,000 adults are enrolled in formal high school and university level courses on a part-time basis. In addition, more than 429,000 adults participate in a host of non-credit courses and related activities.

Another avenue that provides adults an opportunity to continue their education is home study. A recent survey of the provincial departments of education shows that more than 81,000 adults were enrolled in correspondence study courses. Several universities also offer degree or diploma credit courses through correspondence study.

7.2.3 Provincial and territorial education systems

The following paragraphs outline the administration and organization of education in all provinces and territories, emphasizing the important changes that have occurred in recent years.

Newfoundland. Until recently, the system of education in Newfoundland, originally established in 1874, was strictly denominational. As a result of the recommendations of a

provincial Royal Commission on Education and Youth set up in 1964, consolidation of the school systems of the major Protestant denominations has taken place but the Roman Catholic, Pentecostal and Seventh Day Adventist denominations still operate their own schools. Further reorganization occurred in 1969 when schools operated by 300 denominational boards in the province were regrouped into 35 districts. The Pentecostal Assemblies and the Seventh Day Adventists each operate one "school district" which, in theory if not in practice, embraces the whole province. The largest single denomination in the province, Roman Catholic, continues to operate its own system but the number of its boards was recently reduced from over 100 to 15.

Pre-grade 1 enrolment in Newfoundland is not compulsory but, with the construction of larger and more centralized elementary schools, increasing numbers of five-year-olds have been admitted for instruction in kindergarten classes and, by the fall of 1971, the kindergarten enrolment as a proportion of the five-year-old population had reached 95%. The number of children in nursery schools and kindergartens run by private individuals remains quite small.

There are two major patterns of school organization in the province: elementary schools (kindergarten and grades 1-6) with central high schools (grades 7-11), and elementary schools (kindergarten and grades 1-8) with regional high schools (grades 9-11). There are only a few junior high schools (grades 7-9) in the province which is also served by a network of 11 district vocational schools. No vocational instruction, except for commercial courses, is given in the secondary schools.

Tertiary education includes both university and post-secondary non-university programs. Memorial University in Newfoundland offers degree courses in arts and sciences, commerce and business administration, education, engineering and applied sciences, and certificate courses in public administration and banking. Post-secondary non-university education is offered at the College of Trades and Technology and the College of Fisheries, Navigation, Marine Engineering and Electronics. Nurses' (RN) diploma courses are conducted exclusively in hospital schools.

Prince Edward Island. During the past decade, Prince Edward Island has moved from small education units toward consolidation. In July 1972, a major reorganization of the provincial school administration changed the system formerly organized along county lines to one of five administrative units.

Kindergarten classes are not part of the publicly controlled school system; however, nurseries and kindergartens operated by private individuals provide some pre-grade 1 classes although the enrolment is still quite small in relation to the four- and five-year-old population.

The major pattern of school organization in Prince Edward Island until junior matriculation is: elementary school (grades 1-6), junior high school (grades 7-9) and senior high school (grades 10-12); an additional pattern consists of elementary school (grades 1-8) and high school (grades 9-12). As in other provinces, Prince Edward Island is working toward a system that will eliminate "grade" promotion in favour of "subject" promotion, using a "credit" system. Five percent of the elementary and secondary pupils currently receive their education in French, and French is taught as a second language in all other schools.

The province is served by a network of 15 regional high schools offering academic programs from grades 9-12 and a one- or two-year business education course. Two vocational high schools provide a variety of four-year trade courses — a one-year orientation program followed by three years of training in a specific trade concomitant with academic instruction in language, mathematics and science.

The Prince Edward Island School of Nursing is now the only establishment offering a nursing diploma leading to professional registration (RN). Two new institutions were opened in Charlottetown in 1969 — the University of Prince Edward Island which replaced the former Prince of Wales College and St. Dunstan's University, and Holland College which offers post-secondary vocational training.

Nova Scotia. As in other provinces, Nova Scotia has had changes in the organizational structure of elementary and secondary education. The Educational Assistance Act and certain amendments to the Education Act, both passed by the provincial legislature in 1968, allowed for the creation of amalgamated school boards. Three amalgamated boards began operation in 1970-71, and their operation is being evaluated. In addition, there are other boards designated as rural, urban and regional.

Nova Scotia has almost 100% of its five-year-old population in "primary" year in the publicly controlled schools; perhaps as a consequence, enrolment in private nurseries has increased only slightly in recent years.

The predominant grade organization in this province is: elementary school (primary and grades 1-6), junior high school (grades 7-9) and senior high school (grades 10-12). There are a few variations in this basic school pattern, such as primary to grade 6 and grades 7-12, or primary to grade 9 and grades 10-12. In 1969, a modified junior high school program was authorized which gives students of average or above-average standing extra instruction in one or more subjects. High school graduation is at either the grade 11 (junior matriculation) or the grade 12 (senior matriculation) level, although enrolment in the latter is not universal in this province. As a result of revisions in the school system since 1966, 13 regional vocational schools replaced the county vocational schools. Students now attend regional vocational schools for occupational training since the secondary schools provide only business and commercial programs.

In 1969, authority was given for the award of high school equivalency diplomas to adults who had not completed high school but had improved their educational standing through job experience or informal training. This diploma is awarded on the basis of a series of tests, developed and validated over a 25-year period by the Commission on Accreditation of the American Council on Education; Nova Scotia is the first Canadian province permitted to use these tests.

Nova Scotia has two institutes of technology offering trade-level and post-secondary vocational courses, an agricultural college providing post-secondary terminal and university transfer programs, and a land survey institute. A bilingual community college which was scheduled to open in 1970 to serve the Acadian population has not yet become operational. All nursing training leading to the (RN) diploma is carried out in hospital schools. There are several universities and colleges offering degree programs in many disciplines. Teacher training is given in one teachers' college and degree programs in education are offered in five universities — Acadia, Dalhousie, Mount Saint Vincent, St. Francis Xavier and St. Mary's.

New Brunswick. There are 33 school districts in the province combined into seven regions, each administered by a regional superintendent. Instruction is available in both English and French; 34% of the student population at the elementary and secondary level take their instruction in the French language.

Pre-grade 1 classes are not offered in the publicly controlled school system, except in unusual or "experimental" circumstances. Enrolment in private nurseries and kindergartens is also low in proportion to the number of five-year-olds in the province.

The province has a 12-year system of public education leading to junior matriculation. The most common patterns of school organization are: elementary school (grades 1-6), junior high school (grades 7-9) and senior high school (grades 10-12); and elementary school (grades 1-6) and high school (grades 7-12). Vocational courses are taught within the framework of the secondary school system and are taken concomitantly with academic instruction.

The New Brunswick Institute of Technology in Moncton and the Saint John Institute of Technology offer post-secondary vocational and technical programs. Teachers' colleges still remain in New Brunswick although there is indication that they will soon be integrated within the university system. In addition to six hospital schools, the Saint John School of Nursing offers training leading to RN. This province has four universities offering a variety of degree programs.

Quebec. In 1964, the Quebec government, acting on recommendations of the provincial Royal Commission on Education (1961-64), passed legislation (under Bill 60) establishing a new administrative structure for the school system in that province; the Department of Education replaced the former Departments of Youth and of Public Instruction. Today, in addition to the Minister and Deputy Minister, the structure of the Ministry includes two Associate Deputy Ministers — one for the Catholic sector and one for the non-Catholic sector. This change of system required large increases in education expenditures to finance the building of new schools and to acquire additional teaching personnel and materials. In September 1971, there were 64 regional school boards (55 Catholic and 9 Protestant) with 993 affiliated local school boards.

Kindergartens admitting five-year-olds are now part of the school system and in 1971-72

over 90% of the five-year-old population was registered. Elementary education, intended for pupils aged six to 11, is given in publicly controlled schools operated under the direction of local school boards. Since the autumn of 1968, pupils are enrolled in the first grade only if they have reached the age of six by October 1. The new system calls for six years of elementary school, five years of secondary school and a collegial level to be taken in post-secondary non-university institutions. Another emerging trend is a composite course with graduated options and promotion by subject matter.

The federal Department of Indian Affairs and Northern Development assumes full responsibility for the education of Eskimo children living in northern Quebec, and uses the curriculum established by the Department of Education of Quebec.

Collèges d'enseignement général et professionnel (CEGEPs), inaugurated at the beginning of the 1967-68 school year, replaced many of the former classical colleges, normal schools, schools of nursing and technical institutes. These colleges, currently numbering about 40, admit students graduating from grade 11 and offer three-year terminal technical programs and two-year academic programs which are prerequisite for university entrance. Private or classical colleges offer the equivalent of the two-year university transfer program offered in the CEGEP, at the end of which successful students receive a *diplôme d'études collégiales*. Students may, however, continue at these establishments and work toward a degree granted by the university to which the college is affiliated.

There are at present four English-language CEGEPs in operation. McGill University, Sir George Williams University and Loyola College (now affiliated with Sir George Williams) also offer the equivalent two-year CEGEP program preceding the three-year university program, an interim arrangement pending the establishment of additional English-language CEGEPs. Nursing diploma (RN) programs are now carried out exclusively in the CEGEPs. Teachers' colleges still exist in Quebec but the trend is for teacher training to be given in the universities after completion of the academic program in the CEGEPs. There are several universities and colleges located in Quebec that offer a wide variety of degree, diploma and certificate programs.

Ontario. Under recent amendments to the Ontario School Act, county districts have replaced former individual units that were administered by three-member boards of trustees. The larger cities, such as Toronto and Ottawa, are excluded and operate their own school systems. Roman Catholic schools are given a choice. In most of Ontario the separate administration of elementary and secondary schools has been abolished and these schools are now administered by the same board. With each county administered by one board, there has been a drastic reduction from thousands of districts to less than 200. An important amendment to the Act in 1969 provides for schools for trainable retarded children to be established under the jurisdiction of a special divisional board of education.

Ontario has a 13-grade system (senior matriculation) with provision for kindergarten and pre-school enrolment. The predominant pattern of school organization consists of elementary school (kindergarten, grades 1-8) and secondary school (grades 9-13). A variation in this organization is the 6-3-4 pattern: elementary school (kindergarten, grades 1-6), junior high school (grades 7-9) and senior high school (grades 10-13).

One of the latest developments is the employment of a "credit system" to cover the former grades 9-12 leading to the secondary school graduation diploma. This will provide more flexible schedule patterns with a view to greater freedom of student choice within an expanding range of subject offerings, even to the creation of "individual timetables" for students. A credit is defined as a course successfully completed, normally after 110 to 120 hours of scheduled time. The diploma (grade 12 standing) is awarded after the successful completion of a minimum of 27 credits.

High schools in this province offer double-option trade courses in the science, technology and trades programs, and double-option business courses in the business and commerce programs. There is also a two- or three-year occupational program to which some students may voluntarily return for a fourth year. There are also special one-year commercial and technical programs that follow grade 11 or 12.

In Ontario at the beginning of the 1967-68 school year, the former institutes of technology and the provincial vocational centres were incorporated into colleges of applied arts and technology known as CAATs. These colleges were set up in 20 regions to serve the needs of the communities at both the post-secondary and the occupational levels. While the CAATs were

not designed to accommodate prospective university transfer students, the universities do accept first-class graduates from the two- or three-year post-secondary programs into the first and second year degree courses, respectively. On October 1, 1971, these institutions became the responsibility of the newly formed Department of Colleges and Universities. In addition to the regional schools of nursing and the hospital schools of nursing, Humber College and Ryerson Polytechnical Institute offer nurses' (RN) diploma programs. Eight independent teachers' colleges existed in Ontario in 1972-73 but it is assumed that a number of these will soon be integrated with the university system. There are over 20 universities and colleges in this province offering a diversified program of courses leading to degrees, diplomas and certificates.

Manitoba. In 1971-72 over 90% of public school enrolments in Manitoba came under the administration of 48 unitary division boards responsible for all public elementary and secondary education within their jurisdictions. In addition, there are some schools in the remote areas of the province and other special schools that are not included in these 48 unitary division boards.

Public kindergarten classes are available in most elementary schools in Manitoba. Enrolments have almost tripled in the past ten years as these facilities have been expanded and the number of children in private nurseries and kindergartens has consequently declined.

There are two major patterns of school organization in the 12-grade system to senior matriculation: elementary (kindergarten and grades 1-8) and high school (grades 9-12); or elementary (kindergarten and grades 1-6), junior high school (grades 7-9) and senior high school (grades 10-12). Increased emphasis is being placed on open-area classrooms, higher qualifications for teachers, and improved curricula. Other innovations in the elementary and secondary schools include: more meaningful curricula for Indian and Métis children now incorporated into regular classes; emphasis in health programs in relation to alcohol and narcotics; audio-lingual programs in French and German at grade 10 level; and emphasis on continuous testing to replace formal examinations and on the concept of "independent study" for students in some secondary schools. Final examinations are set and marked under the auspices of the High School Examination Board of Manitoba. Entrance to university requires evidence of Board standing in at least three subjects with school standing acceptable in two other subjects.

In Manitoba, vocational students may take either a pre-employment commercial or industrial program the successful completion of which entitles them to an "academic transcript". Alternatively, students may complete the university entrance program and continue for an additional year in a special commercial program, or those following the industrial program may spend half their time in the university entrance program. There is also an occupational entrance program commencing at grade 7 and continuing until grade 10 or 11, during which period students receive part of their training on the job in business or industry.

The Manitoba Institute of Technology and Applied Arts and the two vocational centres at Brandon and The Pas were designated as community colleges in the fall of 1969 and renamed Red River Community College, Assiniboine Community College and Keewatin Community College, respectively. These institutions offer both post-secondary terminal career programs and vocational courses at the trades level. Although no provision is made for university-transfer programs, graduates from the career programs have, in special circumstances, been granted credits applicable to a university program. Training for nurses qualifying them for the RN diploma is provided at Red River College as well as at five hospital schools.

Teacher training is offered only at the university level in this province. Seven colleges and universities are located in Manitoba offering degree programs. The largest – the University of Manitoba – offers a wide range of courses including arts and science, law, medicine, education, applied sciences, architecture and many others.

Saskatchewan. Many schools in the larger centres of Saskatchewan are now offering kindergarten education, although elsewhere in the province such classes are not normally available. The proportion of five-year-olds attending pre-grade 1 classes within the publicly controlled school system has increased from about 15% in 1960-61 to 27% in 1971-72.

The traditional 12 elementary-secondary grades have been replaced by four divisions, each consisting of three years of school for a student making normal progress. In Divisions I

and II, the principle of non-grading, involving the ideas of continuous progress and flexible promotion, has been adopted. Division III programs have been planned to meet the special needs of pupils in the 13-15 age group faced with the problems of emerging adolescence. Division IV is undergoing major changes in the total scope of courses offered and in the content and methods used within particular subject areas. Recent amendments to the Saskatchewan School Act allow for the exclusion from the regular system of children so mentally deficient as to be incapable of learning. Educable handicapped children attend special classes in regular schools; blind and deaf children between seven and 16 years of age are educated in special schools.

In Saskatchewan, vocational subjects may be taken in the general, industrial arts, commercial or special terminal programs, none of which qualify the student for university entrance. Vocational courses in the high schools were set up with a view to providing a closer articulation between those schools and the technical institutes. Most of the vocational students in grade 9, apart from those in the commercial course, take five shops not associated with any one specific trade; similarly, students in grade 10 may take two shops. The Saskatchewan Institute of Applied Arts and Sciences and the Saskatchewan Technical Institute offer vocational courses only at both post-secondary and trades levels. The former has taken over the total responsibility for the nurses' (RN) diploma program, and in 1972 only one hospital school remained.

The University of Saskatchewan, at both the Regina and Saskatoon campuses, offers a wide range of degree programs.

Alberta. Education in Alberta is under constant review by the province's Commission on Educational Planning, charged with the broad task of predicting what Alberta society will be like educationally, socially and economically during the last decades of the 20th century. Innovations in recent years in the elementary-secondary level include: extensive experimentation in programs carried out at the local school level; the use of French as the language of instruction during 50% of the school day in grades 3-12 in certain schools; construction of modern buildings incorporating the latest design in instructional facilities; movement toward the semester system and other methods of dividing the school year; and implementation of school television projects. The province is organized into divisions for purposes of education and each division is administered by its own school board.

Kindergarten classes are not part of the provincial school system although some school boards, particularly those in the cities, do provide such classes. In addition, about 20% of five-year-old children are enrolled in privately operated nursery schools and kindergartens.

The two predominant patterns of school organization in Alberta are: elementary school (grades 1-6), junior high school (grades 7-9) and senior high school (grades 10-12); or elementary school (grades 1-8) and high school (grades 9-12). Alberta operates its secondary schools on the composite or comprehensive principle. Most of the wide range of vocational programs conducted are offered in grades 10-12. In grade 12, some of the vocational courses lead to the granting of 15-20 credits, of which 100 are required for an Alberta High School Diploma.

In the fall of 1971, a new Department of Advanced Education was formed, separate from the Department of Education. This Department is responsible for universities, public colleges, institutes of technology and the agricultural and vocational colleges formerly under the jurisdiction of the Department of Agriculture. The five public colleges, previously known as "junior" colleges, the two institutes of technology and the three agricultural and vocational colleges, all offering vocational programs at the post-secondary level, are now part of the community college system.

Programs at the first- or second-year university level are provided at three church-related institutions: Camrose Lutheran College, the bilingual Collège St. Jean and the Canadian Union College which also offers two-year terminal vocational studies in secretarial science. Nurses' (RN) diploma programs are at present given at both hospital schools and four community colleges: Lethbridge, Medicine Hat, Mount Royal and Red Deer.

One large university, the University of Alberta, offers a variety of courses including fine and applied arts, arts and sciences, medicine, dentistry, pharmacy, nursing, household science, engineering and applied sciences, agriculture, library science, law and education. The province also has two other universities — the University of Calgary and the University of Lethbridge and three small colleges.

British Columbia. Details of education programs in British Columbia are similar to those of the other provinces. Its central organization divides responsibility for: curriculum, instruction, adult education, university and college affairs, research and standards, home economics, correspondence courses, school broadcasts, visual education, technical and vocational education, community programs, Jericho Hill School for the deaf and blind, and examinations.

The majority of school districts provide kindergarten classes. In September 1971, 53% of the five-year-old population was enrolled in pre-grade 1 classes in the publicly controlled elementary schools and enrolments of five-year-olds in privately operated nursery schools and kindergartens accounted for another 12%.

British Columbia's former 13-year system of education culminating in senior matriculation is being replaced with a 12-year system but the senior matriculation year is still available in universities, in some of the regional colleges and in some high schools. The predominant pattern of school organization consists of elementary school (grades 1-6), junior high school (grades 7-9) and senior high school (grades 10-12). Five of the six programs offered in grades 11 and 12 are vocationally oriented — commercial, industrial, community services including home economics (not specifically labour-force-oriented), visual and performing arts, and vocational. There are a substantial number of pupils enrolled in special classes, such as those for educable retarded, blind or deaf children. In most school districts, the less severely handicapped receive special instruction in regular schools but the more severely handicapped are taught in special schools under government or private operation.

Ten community colleges and the British Columbia Institute of Technology have been established since 1965. The colleges, operated by consortiums of school boards, enable residents of a particular geographic area to take the junior years of university or a post-secondary terminal vocational course. Vancouver City College is operated by the Vancouver School Board only, and the British Columbia Institute of Technology, which offers post-secondary career programs only, is operated by the provincial Department of Education. Trinity Junior College is a church-related institution which provides the first two years of university. Columbia Junior College, a private non-denominational institution located in Vancouver, offers a terminal career course in fashion design as well as university transfer programs which are recognized by the University of British Columbia.

In addition to the hospital schools of nursing, the British Columbia Institute of Technology, Selkirk College and Vancouver City College offer the nurses' (RN) program and Vancouver City College provides specific training in psychiatric nursing.

The largest degree-granting institution in the province — the University of British Columbia — has faculties of architecture, law, medicine, applied sciences, education, arts and sciences and others. A major development for the 1970s, based on the report of the Commission on the Future of the Faculty of Education, is the revision of the academic program and administrative structure of this university's Faculty of Education. Among the 85 recommendations are such innovations as the adoption of a single five-year Bachelor of Education program, introduction of the "teaching associate" idea, a new Master of Pedagogy degree, and student participation in decision-making at the operational level. There are two smaller universities, Victoria and Simon Fraser, in British Columbia and a number of small colleges, most of them church-related.

Yukon Territory. The Yukon Territory school system is administered by the Yukon Department of Education and operated through a superintendent and staff at Whitehorse, appointed by the territorial government and responsible to the Commissioner of the Territory. Schools in the Yukon Territory have always been publicly controlled, except for the federal Indian Residential School at Carcross which closed before the 1969-70 school year. In 1971-72 enrolment in the 22 schools was 4,806.

Northwest Territories. The Northwest Territories school system, consisting of the districts of Mackenzie, Franklin and Keewatin, is operated by the Department of Education of the territorial government. The official transfer of responsibility for education from the federal Department of Indian Affairs and Northern Development to the territorial Department of Education occurred in April 1969 in the Mackenzie District and April 1970 in the Franklin and Keewatin Districts; 58 schools came under the control of the territorial Department, in addition to several schools already under its control. Total enrolment in 1971-72 was 11,209.

The territorial Department of Education is continuing the work done in the past by the Department of Indian Affairs and Northern Development, and is providing educational opportunities for northern residents equivalent to those enjoyed by citizens in southern Canada. New schools have been constructed at Edzo, Frobisher Bay, Baker Lake, Cape Dorset, Coral Harbour and Clyde River and an education curriculum has been developed relevant to the cultural heritage of Eskimo, Indian and Métis students, who make up the majority of pupils in the schools. The Department, with the assistance of the Department of Indian Affairs and Northern Development, is initiating the collection of stories and legends of the Dogrib people and a Dogrib grammar and a dictionary are being produced.

7.2.4 Education of Indians and Eskimos

Indians. The key to continual progress in Indian education is the increasingly active participation of the Indians themselves through their education committees and membership on school boards, strengthened by support from non-federal governments and from professional groups concerned specifically with the classroom instruction of Indian students. During 1971-72, 45 Indian trainees attended special courses for social counsellors in Ontario and on graduation were employed by band councils, school boards or the Department of Indian Affairs and Northern Development to provide counselling in various areas of the education program; 53 Indian students were enrolled in training programs in Manitoba that will fully qualify them as teachers; and in Alberta 39 teacher assistants were trained and later employed in the school system. Indian history, traditions and languages are now being included in the curriculum and native culture is stressed by means of language, visual aids, tapes and printed matter as well as by Indian dances and arts.

Although the Education Branch of the Department of Indian Affairs and Northern Development maintains and operates a number of schools for Indians, of the 71,523 Indian students in elementary and secondary schools in January 1972, more than half attended non-federal schools, a system arranged for the most part through agreements between band councils, the Branch and individual school boards. In Manitoba, British Columbia and New Brunswick, however, under agreement with the respective provincial governments, a uniform tuition fee is paid for Indian students attending schools under the jurisdiction of the province. Federal financial assistance for Indian students attending non-federal schools varies from payment of tuition fees and provision of school buses, many of them operated by band councils or Indian contractors, to full maintenance either in boarding homes or student residences, which during the year accommodated 12,000 Indian students unable to attend local schools because of isolation or other reasons. Promising senior students are awarded scholarships to attend university or vocational school, and scholarships are given to those who show promise in the arts; in 1971-72, 89 scholarships were awarded for continued professional training.

Federal schools for Indian students are in operation in all provinces except Newfoundland. During 1971-72, 17 major school construction projects were under way or completed, providing 89 classrooms, 12 kindergartens, 11 gymnasiums and 12 staff units to the federal school system at a cost of approximately \$11 million; an additional \$5.3 million was paid for classroom space in provincial schools attended by Indian pupils. The two-year kindergarten program continued to receive special emphasis and is viewed as a major step in reducing premature withdrawal from school and age-grade retardation; enrolment in this program increased by 13.5%.

Eskimos (Inuit). Great emphasis is given to education and vocational training as the means to help the Eskimo people adjust to a changing way of life. In 1971-72, 4,375 Eskimo pupils were enrolled in school in the Northwest Territories compared with only 451 out of a total of 2,000 pupils in 1955. There are 69 settlements in the Northwest Territories, 32 of which are Eskimo settlements. Of the 58 schools, 30 are in Eskimo settlements. Kindergarten classes are provided in 35 of these schools, 22 of them in Eskimo settlements.

Throughout the Northwest Territories education is a responsibility shared by the federal and territorial governments and administered by the Department of Education of the Northwest Territories. In April 1969 the territorial government assumed responsibility for the administration of education in the Mackenzie District, and a year later took over the same responsibility for the eastern Arctic district. The responsibility for education of the Eskimos in Arctic Quebec remains with the Department of Indian Affairs and Northern Development.

Every Eskimo child in school represents in some measure an achievement over difficulties of climate, distance and language on the part of those responsible for bringing education to Arctic Canada. Education in this rapidly changing society must provide innovative programs if it is to meet the needs of residents, and it is in this context that the Northwest Territories Department of Education developed curriculum, teaching methods and community involvement during 1971.

In September 1971, the first elementary curriculum designed for northern conditions was distributed in draft form to every school in the North. This curriculum contains materials appropriate to the social and cultural environments, including a special series of readers designed for both Indian and Eskimo children.

The Continuing and Special Education Division of the Department provides for all educational and training activities not contained within the formal elementary and secondary school systems. Adult education programs are designed to help adults in the territories develop their abilities to the fullest extent and to make living more meaningful and comfortable in a rapidly changing technological age.

Vocational education programs, including apprenticeship, are designed to train people for either wage employment or self-employment in specific occupations. Apprenticeship continues to be the most effective program for the development of trades people; manual skills are learned on the job where close watch is kept to assure that the apprentice is receiving work experiences in all available trades practice. In addition, each indentured apprentice receives six to eight weeks of full-time trade theory training in an in-school situation during each year of his apprenticeship.

It will, however, be some time before an extensive university program is offered in the North. The University of Saskatchewan now offers courses in its research centre at Rankin Inlet, and the University of Alberta has expanded its program in the Mackenzie area, offering courses at Fort Smith, Yellowknife and Inuvik. During 1971 the first Eskimo medical doctor graduated from the University of Manitoba and the first Eskimo helicopter pilots completed their training.

7.2.5 Financing education

Of the total expenditures on education across Canada amounting to \$7,409 million in 1970, local governments contributed 24%, provincial governments 57%, the federal government 11% and the remaining 8% originated from fees and other sources.

Local and provincial education. The magnitude of the elementary-secondary sector of education is most clearly evident when expressed in dollars. In 1969 and 1970, total expenditures at this level were \$4,263 million and \$4,805 million, respectively, these amounts representing over 65% of all expenditures for all education in Canada. The 1970 expenditure represented a 72% increase over the \$2,791 million spent in 1966 and more than three and a half times the amount reported ten years earlier.

The actual operation of public elementary and secondary schools is in the hands of the local elected or appointed school boards which determine the budgets and therefore the amount of taxes required for school purposes. In most cases, these taxes are levied and collected for the boards by the municipalities; however, in those areas where there is no municipal organization the school boards have the power to levy and collect taxes for school purposes. In the calendar year 1970 local governments provided 46% of the cost of operating the public schools, provincial governments 52%, and the remainder was obtained from various other sources. Except in Newfoundland, where they represent almost 2% of total revenues, fees represent less than 1%. Four provinces — British Columbia, Alberta, Manitoba and Nova Scotia — pay operating grants on an equalization formula and thus ensure at least a minimum level of education throughout the province. The standard is determined either in terms of so much per pupil, or from an established salary scale for teachers with a prescribed teacher-pupil ratio, or by some combination of these.

In Newfoundland where municipal organization scarcely exists outside certain larger centres, there are three school-tax areas. In Prince Edward Island where there is no municipal organization except in the cities of Charlottetown and Summerside, the school boards levy and collect property and poll taxes but the province provides about two thirds of the operating costs. Ontario and Saskatchewan make use of various equalization and incentive grants. On January 1, 1967, the New Brunswick government introduced a Program of Equal Opportunity

under which it assumed full responsibility for public education and other social services. Consequently, in the following two years 98% and 99%, respectively, of the revenue used for public education was derived from provincial taxes (real property and sales taxes); the rest came from miscellaneous sources. Most provinces provide grants for school buildings and equipment, establish loan funds, and guarantee debentures for school purposes and assist in selling them.

The creation of a financial reporting system which ensures comparability between the provinces and timeliness of output has been difficult. However, events have now moved forward to the point where reasonably accurate comparable cost-per-pupil data for each of the provinces at the elementary-secondary level are available. Differences in accounting procedures do create difficulties but, for the most part, can be coped with. It must be remembered that the number of students being dealt with in all cases is extremely large, and the expenditure items on which consistency is difficult to achieve across all provinces are always relatively minor in relation to the provincial total.

In the past, reliance was placed entirely on audited statements and published public accounts for all data; this resulted in delays that sometimes exceeded 30 months between the termination of an academic year and the publication of national information on schooling costs in Canada. However, provincial departments of education are now providing budgets and other information which will make it possible to have financial estimates available at the same time as enrolment statistics.

The determination of accurate educational costs on a current basis has enabled the federal government to provide significant sums of money (\$62.9 million in 1971-72) to the provinces to further the aims of bilingualism. A fixed percentage of the cost-per-pupil of elementary-secondary education is paid to each province, based on their costs, for the amount of minority language education provided and the time devoted to teaching the second language.

The importance of adequate statistics in order to plan and maintain a program of education support cannot be over-emphasized. An excellent data base already exists and it is constantly being refined and improved. The use of education statistics in order to establish and maintain programs designed to meet national and regional aims is now a genuine possibility, and could be put to immediate use.

Financial data (along with enrolment and teaching staff statistics) form an integral part of a developing nation-wide information system which was initiated by the Council of Ministers of Education in Canada but has been carried on by the Education Division of Statistics Canada since 1969. In addition, other initiatives have been taken to round out the statistical picture. In 1971, a survey was undertaken on school transport to provide national and provincial data on a number of aspects of this particular education phenomenon, on which very little information has ever been available; results of the survey are expected in mid-1973. Recent moves in nearly all provinces to consolidate both administrative and education services into large units have resulted in significant increases in pupil transportation services which, it appears, now absorb from 3% to 10% of school board budgets.

Federal contributions to education. In 1970-71, universities and colleges received more than 76% of their operating funds from the federal and provincial governments. Private schools and colleges are normally supported by student fees, endowment income, gifts and income from sponsoring bodies.

In 1969-70, federal government expenditures on education amounted to an estimated \$803 million excluding monies transferred to provinces under the terms of the Federal-Provincial Fiscal Arrangements Act. In addition, some \$205 million was spent at the university level and expenditures on non-university post-secondary education, including vocational training, amounted to \$403 million. Finally, direct expenditures by the federal government on elementary-secondary education and teacher training accounted for \$195 million.

Some 60 federal government departments and agencies contribute to education in one way or another. As stated previously, the federal government has no responsibility for the organization and administration of education. It has, however, a vital interest in the quantity and quality of education, the skills of the population and the extent of scientific research carried on in Canada, realizing the effect of these on the national economy and on individual and social development.

During the past few years, federal support to education has undergone significant change. As a result of the federal-provincial conference of October 1966, the federal government undertook to provide increased support to education. Recognizing that education is a provincial responsibility, it decided to discontinue payment of operating grants directly to universities and to expand its support beyond university education and included in its program all, or almost all, post-secondary education, i.e., the educational institutions and courses requiring for admission at least junior matriculation, or its equivalent, in each province. The provinces were offered the choice of either a federal per capita grant of \$15 based on population or 50% of operating costs of post-secondary education, whichever was greater. Implementing this proposal, Parliament passed the Federal-Provincial Fiscal Arrangements Act in March 1967. This Act authorized the transfer of specific percentages of federal revenue plus required cash from the federal treasury to the provinces for a five-year period commencing with the 1967-68 fiscal year.

The financial resources transferred to the provinces were \$422.3 million in 1967-68; estimates for succeeding years are \$532 million in 1968-69, \$649 million in 1969-70, \$771 million in 1970-71 and \$876 million in 1971-72. The program has been extended for two years, and the amount to be transferred to the provinces in 1972-73 is estimated at \$972 million.

Under the Adult Occupational Training Act the federal government, through the Department of Manpower and Immigration, takes full responsibility for financing the cost of training adults who are or should be in the labour force. The cost of providing primary, secondary and post-secondary education remains a provincial responsibility, although this last sector receives federal support for operating costs. If, in the opinion of a counsellor at a Canada Manpower Centre, it is in the best interest of the individual and of the economy for an adult to undertake training or retraining, it will be purchased by the federal government from a public or private training institution or from industry. The program also provides for payment of allowances to persons whose training programs have been arranged by a manpower counsellor. Payments range between \$30 and \$118 per week, depending on the individual's economic responsibilities.

The Capital Assistance Program was begun in 1961 under the Technical and Vocational Training Assistance Act and continued in 1967 under the Adult Occupational Training Act which set a limit on the total amount payable to each province. It provided assistance to provinces for building and equipping occupational training facilities and by March 31, 1971 the federal government had contributed nearly \$1,100 million toward costs incurred by the provinces for this purpose. In 1970, in order to speed up the construction of needed training facilities and aid the provinces with their cash management problems, the federal government and the provinces agreed to an accelerated phase-out of this program. The provinces received the remainder of their entitlements in 1970-71 and 1971-72, to be spent on vocational training facilities by March 31, 1975. A total of \$76 million was paid to the provinces in 1971-72 under the accelerated phase-out and the normal procedures.

Under the Canada Student Loans Act (RSC 1970, c.S-17), full-time students may borrow up to \$1,400 annually to a total of \$9,800. Loans are interest-free while the student is enrolled and for six months thereafter. Provision is made for the total amount allocated to this program to be increased year by year in proportion to the increase in enrolment in post-secondary institutions. The purpose of the loan plan is to assist those students who, for financial reasons, would otherwise be prevented from acquiring a post-secondary education or would not be able to devote full time to their studies. These loans may be made only on the basis of certificates of eligibility issued by the participating province. There is no upper or lower age limit for eligibility. Funds authorized by certificates of eligibility are issued by the chartered banks, the federal government guaranteeing the loans and paying the interest while the student is attending college. All provinces except Quebec participate; Quebec offers its own student assistance program for the benefit of residents of that province.

The Act provides for basic allocations for each province and also for supplementary allocations to compensate for differences in relative demand as between provinces, based on provincial population in the 18-24-year age group. The basic allocations for the year 1971-72 for participating provinces totalled \$87.3 million with authority for discretionary allocations up to \$37.6 million, making a total maximum of \$124.9 million authorized under the Act. Loans actually authorized amounted to \$91.8 million. In addition, federal payments to lending institutions in respect of interest on outstanding loans and other operational expenses amounted to \$23.3 million.

In 1966, the federal government inaugurated a program of massive financial support to the provinces to provide badly needed facilities for training professional personnel in health services. The Health Resources Fund Act (RSC 1970, c.H-4), administered by the Department of National Health and Welfare, authorized the establishment of a fund to assist financially in the planning, acquisition, construction, renovation and equipping of health training facilities, defined to mean any school, hospital or other institution for the training of persons in the health professions or any occupations associated with the health professions, or for conducting research in the health field; residential accommodation was excluded. The Fund was established in the amount of \$500 million, to be applied to costs incurred between January 1, 1966 and December 31, 1980; of that amount, \$400 million is available to the provinces on a per capita basis, \$25 million is available to the four Atlantic Provinces for joint projects, and \$75 million remains to be allocated by the Governor in Council. Contributions are payable to the provinces in amounts of up to 50% of the cost of projects approved by the Minister's Advisory Committee as part of a five-year plan for the development of health training facilities in a province.

During the five years of operation of this program, 1966-67 to 1970-71, the federal government paid \$143.2 million to the provincial treasuries in respect of approved projects. Projects financed under this program included training facilities in universities or institutions connected with, or operated by, schools of medicine, schools of nursing, including new regional schools of nursing in Ontario, and schools for nursing assistants, as well as facilities for vocational types of training at the higher educational levels.

Through the Canada Council, the federal government in 1957 provided an amount of \$100 million, half of which was to be distributed among the universities for specified building and equipment purposes, similar to the distribution of grants. Interest from the remaining \$50 million was to be used to assist in the development of the arts, humanities and social sciences, mainly through scholarships (see Section 7.4.3).

Other contributions are more indirect and include scholarships, research grants and reports or services of value to the schools. Research grants are made by the National Research Council, the Defence Research Board, the Department of National Health and Welfare, the Department of Manpower and Immigration and other agencies. Some departments — Agriculture and National Health and Welfare, among others — provide materials and publications of value in the school programs; and the National Museums of Canada, the National Gallery, the National Film Board and the Canadian Broadcasting Corporation contribute directly or indirectly to various school programs.

More directly, the federal government is responsible for the education of Indians on reserves, prisoners in penitentiaries, members of the Armed Services and their dependants and in-service training for permanent personnel. It also assists in citizenship training and other out-of-school informal education activities.

External education assistance. The Canadian International Development Agency is responsible for the operation and administration of the technical assistance program offered by the Canadian government to developing countries. The International Development Research Centre, Canadian-financed but international in character, supports and assists research into the economic and social problems faced by developing countries. The activities of both organizations are given in Chapter 4.

7.3 Statistics of schools, colleges and universities

The first two tables concerning this Section give summary statistics of education at elementary, secondary and tertiary levels. Changes in enrolments at the three levels between 1967-68 and 1971-72 are shown in Table 7.1 and detailed data on numbers of schools, teachers and enrolment in the different types of institutions in each province and the territories are presented in Table 7.2.

7.3.1 Enrolments

7.3.1.1 Elementary and secondary enrolment

Elementary and secondary school enrolment combined increased 6% in the five-year period 1967-68 to 1971-72. Enrolment at the elementary level alone declined fractionally in the same period, a result expected from the low birth rates in the mid-1960s. However, at the secondary level enrolments were substantially higher by 26%, still reflecting the upsurge in the

Full-time enrolment in schools, colleges and universities, 1967-68 to 1971-72

numbers of students at the beginning of the 1960s resulting from the high birth rates prevailing during the war and postwar years. Secondary school enrolments are growing in every province almost without exception as pupils attending elementary school in the 1960s move into the higher grades. This increase is also related in part to the fact that students are staying in school longer and larger numbers of them are planning to go on to some form of post-secondary education. In addition, the greater diversification of courses offered which better prepare students for entry into the labour force and which more adequately fulfil the needs of the community, as well as the greater accessibility to further education, appears to affect school retention rates.

Table 7.3 shows enrolment in all elementary and secondary schools in Canada and in National Defence schools overseas in 1970-71 by grade, and Table 7.4 shows the same enrolment by age.

Only 2.5% of all elementary-secondary school students were enrolled in private schools in 1971-72. In almost every province, these schools are being integrated into the public school system, possibly because of the improving quality of public education throughout the country, rising costs associated with private education and increasing democratization of education. Table 7.5 shows that in the five-year period 1967-68 to 1971-72 enrolment in private schools in all provinces except Newfoundland and Ontario declined substantially, although there were year-to-year fluctuations within the period in most provinces. Quebec, however, reported a significant increase in 1971-72 over the previous year.

7.3.1.2 Post-secondary non-university enrolment

During recent years, enrolment in post-secondary non-university education has grown rapidly due partly to new organizational structures and partly to a range of new programs that comprise programs in teachers' colleges, hospital and regional schools of nursing, some universities, and especially in community colleges.

As shown in Table 7.6, in 1971-72 the 126,830 enrolments in post-secondary non-university education represented an increase of 8,018 students or 6.7% over the previous year. Of the total enrolment, community colleges and related institutions accounted for 75.7% and universities for 6.2%. Enrolments in teachers' colleges and in hospital and regional schools of nursing decreased between 1970-71 and 1971-72 due to more teacher training programs being given in universities and nursing programs in community colleges. It is expected that within a few years no teachers' colleges or hospital or regional schools of nursing will remain in operation.

Women represented almost half (49.4%) of all students enrolled in post-secondary non-university institutions in 1970-71, a decrease from 56% in 1966-67 and a significant decline from the 69% shown in 1961. The inclusion of new courses such as civil and marine engineering in community college programs, thereby reducing the predominance of the nursing and teacher training programs, and the transfer of teacher training in part to the universities, have contributed to the apparent decline. However, women still predominate in nursing, teacher training, medical and dental technology, and social welfare and recreation programs (Table 7.7).

As shown in Table 7.8, community colleges in all provinces except Newfoundland, Prince Edward Island, New Brunswick, Ontario and Manitoba offer university-transfer programs. In 1971-72, 54,826 students were enrolled in these programs, representing an increase of 12.8% over the previous year and of 580% over 1967-68, the extremely large increase over the five-year period being due almost entirely to the introduction of the CEGEP system in Quebec.

7.3.1.3 University enrolment and graduate degrees conferred

During the 1967-68 to 1971-72 period, full-time university enrolment in Canada increased by approximately 70,000 students, or 27%, although the rate of increase has declined notably in the past two years. The increase in 1971-72 over the preceding year was only 4.4% and in a few universities enrolment has actually decreased (Table 7.9). Over the five-year period, the number of women in universities increased by 40%, and in 1971-72 women accounted for 36% of all enrolments compared with 33% five years earlier. Quebec and Ontario, the most populous provinces, accounted for more than 60% of all university and college enrolments.

It should be noted that, in addition to the full-time university-grade enrolment, the number of students enrolled in pre-matriculation or university-grade courses on a part-time basis, either in the evenings, during summer session or by correspondence, was equal to more than half of the full-time enrolment in the regular winter session in 1970-71.

Table 7.10 shows that during the five-year period 1966-67 to 1970-71 the number of degrees granted continued to increase, bachelor and first professional degrees by 57%, masters' degrees by 83% and earned doctorates by 108%. The proportion of women receiving these degrees has been approximately the same in all provinces.

In 1970-71, as in 1961-62, a large percentage of women graduated in courses traditionally considered to be of interest to women (Table 7.11). More than 85% of the bachelor and first professional degrees conferred on women were in arts and fine arts, education, humanities and related subjects, library science, nursing, and social sciences and related subjects; on the other hand, the proportion of men receiving first professional degrees in these fields was significantly lower, and has increased only slightly, from 50% to 54%, over the ten-year period. The percentage of women to total first and professional degrees granted in law, pharmacy and architecture has shown some increase recently but the proportion of women receiving these degrees to total first and professional degrees conferred on women has not.

Women received 20.3% of all graduate-level degrees and diplomas awarded by the universities (Table 7.12). Further, women were awarded 21.5% of the diplomas conferred, 22% of the masters and 9.3% of the doctorates. In relation to first professional degrees, over 80% of the graduate degrees and diplomas conferred on women were in education, the humanities and related subjects, and the social sciences and related subjects; at the same time, 41% of the men graduated in science and related subjects.

Provincial percentages of the total Canadian population and provincial percentages of total degrees granted at all levels, 1970-71

Each year Canadian universities and colleges admit a large number of students from other countries of whom a growing proportion come from countries other than the United States and Britain. In the 1970-71 academic year, of 22,376 full-time students from all countries, 9,466 were from Commonwealth countries; in 1961-62, students from outside Canada numbered 7,251, of whom 3,294 were from the Commonwealth. Historically, most of the foreign students in graduate schools in Canada have been males; consequently, the number of such students should be considered, for example, when calculating the proportion of female enrolment and graduate degrees conferred on women to total enrolment and degrees granted. In 1970-71, male enrolments constituted 82.2% of the 22,376 students coming from other countries.

7.3.1.4 Registrations in continuing education programs

Course registrations in school board continuing education programs in 1970-71 were substantial, as shown in Table 7.13. In 1970-71, adult enrolment in these courses totalled 795,303 with the highest proportions being in academic, hobby skills and vocational courses, respectively, with 32.8%, 28.0% and 20.6% of the total. Many individuals taking these courses enrol in more than one subject, and it is estimated that the 795,303 registrations in school board continuing education programs represented 467,079 individual participants. Three provinces, Quebec, Ontario and British Columbia, accounted for 85.2% of the national total. Quebec led Canada's back-to-school movement in 1970-71 with 287,684 registrations. Fewer men than women participated in school board continuing education courses in 1970-71, numbering 324,084 or 40.6% of total registrations.

As shown in Table 7.14, correspondence courses represent another avenue by which adults may continue their education. Total registrations in 1970-71 numbered 117,374, representing an estimated 81,419 individual participants. Academic courses reported the largest registration, with 72.0% of the national total. Women accounted for 92.5% of total registrations in correspondence courses.

Table 7.15 shows that in 1970-71 universities offering non-credit courses to adults reported 205,178 registrations, representing 136,785 individual participants. Professional development courses, in which health sciences and business and management had the highest

enrolment, accounted for about 42% of the 205,178 registrations; about 40% were in general interest courses, of which fine arts appreciation and instruction, and human relationships and leadership were the most popular; the remaining 18% were in association certificate courses of which accounting made up almost half.

Table 7.16 shows that part-time university and college enrolment in 1970-71 was also quite high; 89.5% of the students were enrolled in undergraduate degree, diploma and certificate courses, 9.1% in graduate programs, and 1.4% in non-university-level diploma or certificate courses. Women accounted for 41.5% of the part-time students in undergraduate programs, 23.6% of the part-time students in graduate programs and 31.3% of those not preparing for university-awarded degrees, diplomas or certificates.

7.3.2 Teaching staff

7.3.2.1 Elementary and secondary schools

During the 1950s and 1960s, the number of teachers in publicly controlled schools in Canada increased from 85,152 to 249,078, or by 193%. However, this steeply upward trend is not expected to continue during the next few years. At the elementary level the increase will be limited because of the predicted decline in school enrolment and, although secondary school student numbers are growing, the teaching staff at that level will not increase proportionately because of the current higher student-teacher ratio and greater teacher specialization.

As shown in Table 7.17, in 1970-71 male teachers at the secondary school level significantly outnumbered female teachers in nine provinces (data for Ontario are not available) but the opposite is true for teachers at the elementary level.

The median salary in 1970-71 for all teachers (excluding Quebec and Ontario) was \$7,688, an increase of 291% over the median salary of \$1,965 in 1949-50. The rate of increase from one year to the next during the two decades fluctuated considerably, ranging from 2.4% in 1962-63 to 9.7% in 1968-69.

It should be noted that variations in median salaries do not necessarily indicate variations in the salary schedules on which teachers are being paid. Since salary scales are based on both years of education and years of teaching service, improvements in the teaching force based on either of these two factors could conceivably cause an increase in the median salary even though the salary scale remained constant. Thus, when the rise in the median is used for interprovincial or historical comparisons, the effects of other contributing factors should be taken into account.

The median salary of men teachers is higher than that of women teachers at both the elementary and secondary levels for all provinces except Quebec and Ontario. Although, proportionately, the women teachers have more years of experience, a greater proportion of the men teachers are university graduates. However, the proportion of teachers, both men and women, with university graduation has been rising steadily over the past few years and this trend is expected to continue and should result in a corresponding decrease in the present salary differential.

7.3.2.2 Post-secondary non-university schools

The number of instructors in community colleges and related institutions in nine provinces (excluding Quebec) was 4,434 in 1969-70 and the number in all provinces was 9,459 in 1970-71. Quebec alone reported 4,500 or 47.6% of all community college teachers; this can be explained by the large number of CEGEPs in that province. The figure for each province in 1970-71 is given in Table 7.2.

The number of full-time university teachers in Canada during the period 1967-68 to 1971-72 has risen by 70%, from an estimated 18,000 to 25,724, although the rate of annual increase has declined from 15.0% to 4.5%. It should be noted, however, that these figures are based on returns from institutions representing 50% to 90% of the enrolment, depending on the academic year, and are consequently estimates.

As shown in Table 7.18, the median salary of university teachers in 1970-71 was \$14,248, an amount 7.4% higher than in the previous year. By rank, the median salary for deans was \$25,950, up 7.8% from the previous year; for professors, \$21,504 or 8.2% higher; for associate professors, \$16,057 or 7.0% higher; for assistant professors, \$12,701 or 7.3% higher; and for instructors and lecturers, \$10,002 or 5.9% higher.

Over the five-year period 1966-67 to 1970-71, the median salary of university teachers increased from \$10,550 to \$14,248, which represents an increase of 35%. During the same

period, the increase in median salary by rank was 37% for deans and about 34% for all others.

7.3.3 Expenditures

Table 7.19 contains information on expenditures in Canada by source of funds. Responsibility for the organization and administration of public education lies with the provincial and territorial governments; in exercising this capacity they represent the main source of funds for education. In 1970, 57.0% of all funds for education came from provincial governments, followed by municipal governments with 23.8%; federal government, 10.8%; other sources, 4.3%; and fees, 4.1%.

In 1970, expenditures on education totalled \$7,408.9 million, an increase of 78.3% over the 1966 figure of \$4,155.2 million. The proportion of funds provided by the provincial government on education has increased during the period, while the proportions derived from the federal government, municipal governments, fees and other sources have decreased.

In Table 7.20, expenditures on education are given by level of study. Elementary and secondary education accounted for \$4,805.8 million or 64.9% of the total. Expenditures on post-secondary education followed with 28.9% and on vocational training with 6.2%.

In 1970, expenditures for vocational training were 86.5% higher than they were in 1966. During the same period expenditures for elementary and secondary and for university levels increased by 72.2% and 91.8%, respectively.

7.4 Cultural education

7.4.1 Art schools and galleries

There has been considerable expansion of education opportunities in the arts in Canada in the past few years. Courses of artistic content have increased to some extent in the universities but the main growth has taken place in the newly established community colleges of Ontario and the *collèges d'enseignement général et professionnel* (CEGEPs) of Quebec. These colleges offer both the transfer diploma which allows the student to continue his studies at university, and the vocational diploma with which the student may seek employment in his area of specialty. There are also independent institutions, such as the Artists' Workshop in Toronto, the National Theatre School in Montreal and the Kootenay School of Art in Nelson, BC, where instruction is given with or without diploma awards.

Table 7.21 shows the facilities available for the study of the arts in Canada in 1969-70 as reported by 39 universities, 67 colleges and 15 independent institutions.

7.4.1.1 Fine arts schools, galleries and organizations

Fine arts (architecture, painting and drawing, commercial and decorative arts, graphics, ceramics and sculpture) appears as an elective subject of the faculty of arts in a number of universities, where it may be taken as one of five, six or more subjects for a year or two. Eight universities offer a Bachelor of Fine Arts degree: Mount Allison University, Sir George Williams University, University of Windsor, University of Manitoba, University of Alberta, University of Calgary, University of British Columbia, and the University of Victoria. Twelve universities offer a Bachelor of Arts degree with a major in Fine Arts: Université de Moncton, McGill University, Sir George Williams University, University of Ottawa, University of Toronto, York University, McMaster University, University of Guelph, University of Western Ontario, University of Windsor, University of Saskatchewan, and the University of British Columbia.

There are many colleges and schools of art with varying academic requirements for admission. These offer diploma or certificate courses and are concerned largely with the technical development of the artist. Among those widely known are: Halifax – Nova Scotia College of Art; Quebec City – École des Beaux-Arts; Montreal – École des Beaux-Arts, Institut des Arts Appliqués, School of Art and Design of the Montreal Museum of Fine Arts; Toronto – Humber College of Applied Arts and Technology, Ontario College of Art, Artists' Workshop, Hockley Valley School, The New School of Art; Brampton – Sheridan College of Applied Arts and Technology; Kitchener – Doon School of Fine Arts; Winnipeg – University of Manitoba School of Art; Regina – School of Art, Regina Campus, University of Saskatchewan; Banff – Banff School of Fine Arts; Calgary – Alberta College of Art, Southern Alberta Institute of Technology; Nelson – Kootenay School of Art; Vancouver – Capilano College, Vancouver School of Art; Victoria – University of Victoria.

Courses vary in length with the requirements of the individual student but may extend

over as many as four years. In some of these schools fine crafts as well as fine arts are taught. Summer schools of art are sponsored by some of the foregoing institutions, by universities and by various independent groups. One of the more important summer schools is the Banff School of Fine Arts, affiliated with the University of Calgary.

Public art galleries in the principal cities perform valuable educational services among adults and children. Children's Saturday classes, conducted tours for school pupils and adults, radio talks, lectures and concerts are features of the programs of the various galleries. Many of these institutions supply travelling exhibitions for their surrounding areas or range even farther afield. Several organizations such as the Maritime Art Association, the Atlantic Provinces Art Circuit, the Western Canada Art Circuit, the Art Institute of Ontario, the Art Gallery of Ontario and the new *Fédération des centres culturels du Québec* have been founded to carry out this sort of travelling program on a regional basis. On a smaller scale, art circuits are organized to serve certain areas such as those around St. John's, Nfld., Charlottetown, PEI, Trois-Rivières and Hull, Que., and Winnipeg, Man. The National Gallery of Canada conducts a nation-wide program of this nature and is one of the largest art-circulating agencies in North America. Several galleries maintain an art-rental service.

Among the principal public art galleries are:

Fathers of Confederation Art Gallery and Museum, Charlottetown, PEI

Beaverbrook Art Gallery, Fredericton, NB

Musée du Québec, Quebec, Que.

Montreal Museum of Fine Arts, Montreal, Que.

Musée d'Art Contemporain, Montreal, Que.

National Gallery of Canada, Ottawa, Ont.

Art Gallery of Ontario, Toronto, Ont.

Art Gallery of Hamilton, Hamilton, Ont.

Art Gallery of Windsor, Windsor, Ont.

Kitchener - Waterloo Art Gallery, Kitchener, Ont.

Public Library and Art Museum, London, Ont.

Sarnia Public Library and Art Gallery, Sarnia, Ont.

Winnipeg Art Gallery, Winnipeg, Man.

Moose Jaw Art Gallery and Museum, Moose Jaw, Sask.

Saskatoon Gallery and Conservatory Corporation, Saskatoon, Sask.

Edmonton Art Gallery, Edmonton, Alta.

Vancouver Art Gallery, Vancouver, BC

Art Gallery of Greater Victoria, Victoria, BC.

Other important collections of art are housed in arts councils and university galleries.

Among the university galleries are:

St. John's Memorial University Art Gallery, St. John's, Nfld.

Anna Leonowens Gallery, Nova Scotia College of Art, Halifax, NS

Dalhousie University Art Gallery, Halifax, NS

Creative Art Centre of the University of New Brunswick, Fredericton, NB

Owens Museum of Fine Arts, Mount Allison University, Sackville, NB

Université de Moncton, Moncton, NB

Séminaire des Clercs de St-Viateur, Joliette, Que.

Université Laval, Quebec, Que.

McGill University, Montreal, Que.

Sir George Williams University Art Gallery, Montreal, Que.

Agnes Etherington Art Centre, Queen's University, Kingston, Ont.

Canadian Gallery of the Royal Ontario Museum, Toronto, Ont.

York University, Toronto, Ont.

University of Waterloo Art Gallery, Waterloo, Ont.

McIntosh Memorial Art Gallery, University of Western Ontario, London, Ont.

University of Manitoba, Winnipeg, Man.

Norman Mackenzie Art Gallery of the University of Saskatchewan, Regina, Sask.

University of Saskatchewan, Saskatoon, Sask.

University of Alberta, Edmonton, Alta.

University of Calgary, Calgary, Alta.

Fine Arts Gallery of the University of British Columbia, Vancouver, BC.

Five of the more important galleries connected with arts councils are the St. Catharines and District Arts Council, St. Catharines, Ont., the Glenhyrst Arts Council, Brantford, Ont., the Department of Fine Arts, McMaster University, Hamilton, Ont., the Brandon Allied Arts Centre, Brandon, Man., and the Art Gallery of the Calgary Allied Arts Centre, Calgary, Alta.

Among the leading fine arts organizations of national scope, exclusive of museums and art galleries, are: Association of Canadian Industrial Designers, National Design Council, Canadian Conference of the Arts, Canadian Craftsmen's Association, Canadian Society for Education through Art, Canadian Group of Painters, Canadian Guild of Potters, Canadian Handicrafts Guild, Canadian Museums Association, Canadian Society of Graphic Art, Canadian Society of Painter-Etchers and Engravers, Canadian Society of Painters in Water Colour, Canadian Society of Landscape Architects, Federation of Canadian Woodcarvers, Royal Canadian Academy of Arts, Royal Architectural Institute of Canada, Sculptors' Society of Canada, Town Planning Institute of Canada, Canadian Centre for Films on Art, and Community Planning Association of Canada.

7.4.1.2 The National Gallery of Canada

The beginnings of the National Gallery of Canada are associated with the founding of the Royal Canadian Academy of Arts in 1880. The Marquis of Lorne, then Governor General, had recommended and assisted in the founding of the Academy and among the tasks he assigned to that institution was the establishment of a National Gallery at the seat of government. Until 1907 the National Gallery was under the direct control of a Minister of the Crown but in that year, in response to public demand, an Advisory Arts Council consisting of three persons outside government was appointed by the government to administer grants to the National Gallery. Three years later, the first professional curator was appointed.

In 1913, the National Gallery was incorporated by Act of Parliament and placed under the administration of a board of trustees appointed by the Governor General in Council; its function was to encourage public interest in the arts and to promote the interests of art throughout the country. Under this management, the Gallery increased its collections and developed into an art institution worthy of international recognition. Today, a board of trustees, reporting to the Secretary of State, administers all the National Museums of Canada, including the National Gallery.

The Gallery's collections have been built up along international lines and give the people of Canada an indication of the origins from which their own traditions are developing. The collection of Canadian art, the most extensive and important in existence, is continually being augmented. Over 60% of all new acquisitions since 1966 have been Canadian. The present Canadian content of the permanent collections is: paintings, 79%; sculpture, 66%; prints, 17%; drawings, 61%; and all other acquisitions, 74%. There are now more than 11,600 works of art in the collections. Included are many Old Masters, 12 having been acquired from the famous Liechtenstein collection. The Massey collection was presented to the Gallery during 1946-50 by the Massey Foundation. There is a growing collection of contemporary art, prints and drawings, and diploma works of the Royal Canadian Academy. The services of the Gallery include the operation of a reference library open to the public containing more than 40,000 volumes and periodicals on the history of art and other related subjects.

In 1972, the Gallery's National Conservation Research Laboratory underwent change. It had been established in 1964 to provide technical information on works of art from public and private collections across Canada and to be responsible for the conservation of the national art collections. In addition, research was carried out on the effects of environment on works of art and on the durability of artists' materials. The latter role was given to the newly constituted Canadian Conservation Institute with the broadened responsibility of conducting research into methods of preserving, restoring and transporting all types of cultural objects, the training of specialists in these fields, and the provision of consultant services to museums. The new Institute remains a part of the National Museums of Canada. The National Gallery retains its conservation function, which was established long before the creation of the National Conservation Research Laboratory. This division of the Gallery has been designated as the Restoration and Conservation Laboratory.

An active program of exhibitions, lectures, films and guided tours is maintained for visitors to the Gallery in Ottawa. The interests of the country as a whole are served by circulating exhibitions, lecture tours, publications, reproductions and films prepared by the National Gallery staff. Promotion of and information on art films are handled by the Canadian Centre for Films on Art, and their distribution by the Canadian Film Institute. The Gallery promotes interest in Canadian art abroad by participating in international exhibitions such as the Biennials of Venice and Paris, and by preparing major exhibitions of Canadian art for showing in other countries. It also brings important exhibitions from abroad for showing in Canada.

7.4.1.3 Performing arts schools

Degree courses in music, the most widespread of the performing arts (which also include opera, drama, ballet and dance) are offered at a number of Canadian universities, listed as follows:

St. Francis Xavier University, Antigonish, NS — BA major
 Dalhousie University, Halifax, NS — BMusEd
 Mount Saint Vincent, Halifax, NS — BA (mus.)
 Acadia University, Wolfville, NS — BA major, LMus, and BMus
 Mount Allison University, Sackville, NB — BA major, BMus, BMEd
 Université de Moncton, Moncton, NB — BA (mus.)
 Université Laval, Quebec, Que. — LMus, BMus, DMus
 McGill University, Montreal, Que. — LMus, BMus, MMA (musical arts)
 Université de Montréal, Montreal, Que. — LMus, BMus, and DMus
 Carleton University, Ottawa, Ont. — BA (mus.)
 Queen's University, Kingston, Ont. — BMus, BA major
 University of Toronto, Toronto, Ont. — BMus, BA (mus.), ArtDipMus, LicDipMus, MusBac (performance), MusBac (history, literature, composition, education), MusM, MA (musicology), MusDoc, PhD (musicology)
 McMaster University, Hamilton, Ont. — MusBac
 University of Western Ontario, London, Ont. — BA major, MusB, MA (musicology), and MusM
 University of Windsor, Windsor, Ont. — BA (mus.) and BMus
 University of Manitoba, Winnipeg, Man. — BA major, AMM, LMM and BMus
 Brandon University, Brandon, Man. — BMus (education or performance)
 University of Saskatchewan, Regina, Sask. — AMUS, LMUS, BMus, BMusEd
 University of Saskatchewan, Saskatoon, Sask. — BA major, BMus, BMusEd
 University of Lethbridge, Lethbridge, Alta. — BA (mus.)
 University of Alberta, Edmonton, Alta. — BMus and MMus
 University of Calgary, Calgary, Alta. — BMus
 University of British Columbia, Vancouver, BC — BA major, BMus and MMus
 University of Victoria, Victoria, BC — BMus, MMus, PhD (mus.).

Advanced instruction in music is also given at the Conservatoire de Musique et d'Art Dramatique in both Montreal and Quebec. Opera may be studied at the Royal Conservatory Opera School of the University of Toronto where advanced students work in close collaboration with the Canadian Opera Company and also at the Conservatoire de Musique et d'Art Dramatique and at the Banff School of Fine Arts (summer) at Banff, Alta., an affiliate of the University of Calgary.

Degree courses in drama are offered at the following universities:

Université de Moncton, Moncton, NB — BA (art dramatique)
 Sir George Williams University, Montreal, Que. — BFA (drama)
 Queen's University, Kingston, Ont. — BA (drama)
 University of Toronto, Toronto, Ont. — MA (drama)
 University of Windsor, Windsor, Ont. — BA (drama), BFA (dramatic art)
 University of Saskatchewan, Regina, Sask. — BFA (drama)
 University of Saskatchewan, Saskatoon, Sask. — BA (drama), MA (drama)
 University of Alberta, Edmonton, Alta. — BA (drama), MA (drama), BFA (drama), MFA (drama, design or directing)
 University of Calgary, Calgary, Alta. — BFA (drama)
 University of British Columbia, Vancouver, BC — BA (theatre), MA (theatre)
 University of Victoria, Victoria, BC — BFA (theatre).

Advanced instruction in drama is also given during the summer at the Banff School of Fine Arts. The National Theatre School of Canada offers complete practical training for talented students; it is bilingual, courses being held at Montreal, Que., from October to June. Three years are required for the acting course and two for technical and production studies.

The National Ballet School at Toronto is the only residential ballet school in Canada. It offers academic studies together with practical instruction. Professional instruction is also offered by two other major Canadian ballet companies, *Les Grands Ballets Canadiens*, Montreal, and the Royal Winnipeg Ballet, Winnipeg, and advanced ballet training is given during the summer at the Banff School of Fine Arts.

7.4.2 Museums

The museums of Canada, as elsewhere, range from small, locally gathered, historical artifacts and objects to large government-operated institutions which collect, classify and

display such objects as may be necessary to study and disseminate knowledge of natural history, human history, science and technology, with special but not exclusive reference to Canada. Many of these larger museums, especially the National Museums of Canada and the Royal Ontario Museum, have a long, distinguished heritage in research and publication of scholarly works and serve an important role as educational and cultural centres. In this area they have an advantage over other agencies of education in that they are able to provide, for study and exhibition, actual, original objects as well as descriptions and pictures of such objects. They offer many educational services to the public through exhibits, guided tours, lectures and scientific and popular publications.

7.4.2.1 Educational programs

In 1970, 140, or 19.8%, of all museums and related institutions in Canada maintained educational programs. The following museums have staff members who are specifically charged with organizing programs in education and providing extension services: Nova Scotia Museum, Halifax, NS; McGill University museums, Montreal, Que.; National Museums of Canada, Ottawa, Ont.; Royal Ontario Museum, Toronto, Ont.; and Saskatchewan Museum of Natural History, Regina, Sask.

Other museums that conduct educational and extension programs using the regular curatorial and administrative staff are: The New Brunswick Museum, Saint John, NB; Musée du Québec, Québec, Que.; Manitoba Museum of Man and Nature, Winnipeg, Man.; British Columbia Provincial Museum, Victoria, BC.

Direct work with schools may involve the holding of classes within the museum or visits of museum lecturers, with exhibits, to the schools. More informal are the guided tours for visiting school classes, loans of specimens, slides, filmstrips or motion picture films to schools, and the training of student-teachers in the educational use of the museum. For children, a number of museums have special programs not directly associated with school work including Saturday lectures and film showings, activity groups, nature clubs and field excursions. At the higher educational level, museum field parties provide research training to university students in many disciplines and museum staffs act as professional consultants, answer a host of inquiries on scientific and technical subjects, and serve as consultants or advisers to foreign scholars and institutions. There were 288, or 40.7%, of the museums and related institutions conducting research related to collections in 1970.

For adults, museums offer lectures, film shows and guided tours, the latter usually available throughout the year. Staff members may give lectures to service clubs, church groups, parent-teacher associations and hobby clubs. The latter, such as naturalists' groups, mineral clubs and astronomy societies, may be allowed to use the museum as their headquarters. Travelling exhibits are prepared for showing at local fairs, historical celebrations and conventions. Some Canadian museums have conducted regular radio or television programs and others have made occasional contributions. Some historical museums stage annual events during which the arts, crafts or industries represented by the exhibits are demonstrated to the public.

Table 7.22 presents results of a survey completed by Statistics Canada for the year 1970. Some 55 million visits were made to 708 Canadian museums, art galleries and related institutions, including the National Museums of Canada; of these, 2.9 million were in groups arranged by schools, churches and other organizations. The institutions were staffed by 3,793 full-time and 3,157 part-time employees, and 6,515 volunteers. Their operating expenditures reached almost \$40 million, and only 38.5% charged admission fees.

7.4.2.2 National Museums of Canada

The responsibilities of a great museum include collecting, preserving and storing objects related to the various disciplines within its area of activities. Of equal importance is the research carried out by specialists in these fields and the publication of their findings. Museums exhibit artifacts from their collections in attractively designed displays to illustrate the scientific origins of the various subjects. This, however, is only part of a museum's extensive education program, which extends to lectures, publications, inquiries, consultations, workshops, guided tours for children and adults alike, travelling exhibits, loans, library services and radio and television programs. The National Museums of Canada present all these facets for the enjoyment and education of the people of Canada.

The staff common to the National Museums of Canada and the National Gallery

concerned with exhibition and educational, technical, administrative and financial functions, totalled 423 during 1971-72, including six executives and 84 scientific and professional, 163 administrative and administrative support, 89 general technical and 81 operational employees. During the 1971-72 fiscal year, the Victoria Memorial Building, which houses the Museums of Natural Sciences and of Man, was closed for renovations and therefore not available to visitors; the National Gallery had about 405,400 visitors, the Museum of Science and Technology, more than 500,000 visitors, the National Aeronautical Collection, which is part of the latter Museum, about 134,000 visitors, and the Canadian War Museum, nearly 381,000 visitors.

The early history of the National Museums was described in the *1972 Canada Year Book*, pp. 418-419. Recent activities of the museums are outlined in the following paragraphs; activities of the National Gallery may be found in Section 7.4.1.2.

The National Museum of Natural Sciences contains divisions of botany, zoology, geology and palaeontology. During the year 1971-72, thousands of specimens were added to its collection as a result of field trips, purchases, donations and exchanges.

The Museum staff was engaged during the year in 65 major research projects and 25 projects of lesser importance, and supported such research as the Polar Continental Shelf Project and the Hudson and Sackville expeditions undertaken by the Department of Energy, Mines and Resources. The Museum supports projects undertaken in universities by staff members or by research associates and provides financial assistance, research facilities and field work for several National Research Council post-doctoral fellows.

The Victoria Memorial Museum building, which houses the Museum of Natural Sciences, was closed in November 1969 for complete renovation and since then the staff has been intensively engaged in planning and designing the new display halls that are now being constructed. When the building reopens, the Museum will be in a position to more completely fulfil its mandate to inform and educate the public.

The Canadian Oceanographic Identification Centre of the Museum processes some 360,000 specimens each year, mainly for other departments of government.

The Museum staff produces five series of publications and assists in the preparation of audio-visual material.

The National Museum of Man contains divisions of Archaeology, Ethnology and History as well as the Canadian Centre for Folk Culture Studies and the Canadian War Museum. During the year ended March 31, 1972, the Archaeological Survey of Canada continued work on some 100 sites across Canada, increasing emphasis being given to salvaging sites in immediate danger of being destroyed by human or natural forces; other government departments also have recognized the importance of this work and have made financial contributions to the Museum in support of it. Major projects on the prehistory of Canada's North and of the west coast of Alaska dominated the non-salvage work, along with the surveying and testing of other areas. The Ethnology Division continued its field studies with the Golden Lake Algonquin, the Koyukuk River Athapascans, the Odanak Abenakis, the Carrier - Chilcotin people of British Columbia and the Cree and Chipewyans of northern Saskatchewan, but its activities were dominated by the Museum exhibition program and museology training. As in archaeology, salvage or rescue work continued to be the main focus of effort, as knowledge of traditional life dies with the older Indian and as man and nature destroy archaeological sites. The staff of the History Division, with the assistance of contract researchers, continued studies on Canadian society and material culture since the beginnings of European colonization, including such subjects as public attitudes toward Indians in western Canada before World War I, coal mining in Nova Scotia, the status of women in Upper Canada, lighting devices prior to electricity, Windsor chairs, Canadian-made stoves, and work of Canadian silversmiths. In addition, studies were continued as part of planning for permanent exhibits on such broad historical themes as urban life, rural life, social structure, social change, and man and his environment in Canada. The Canadian Centre for Folk Culture Studies awarded many contracts related to the folklore of Canadian ethnic groups. Among the groups studied are the Sikhs and Chinese in British Columbia, the Germans in Manitoba, the French and Ukrainians in Manitoba and Saskatchewan, and the Negroes in Nova Scotia.

The Canadian War Museum was refurbished and the Annex prepared for reopening in mid-1971 with new exhibits on the evolution of artillery, the development of armoured

fighting vehicles and the air defence of Britain in World War I. Militaria and memorabilia continued to come from private donors and many new articles (vehicles, medals and uniforms) have been added.

The Communications Division plans and co-ordinates the interpretation and exhibition program in the permanent exhibit halls and organizes travelling exhibitions; 13 exhibitions are now in circulation, including the History of Early Domestic Lighting in Canada display for which requests have come from all across the continent, and one on Eskimo prehistory now circulating in the Northwest Territories. Plans for all permanent and temporary exhibit halls have been expanded and designs for the orientation, archaeology and ethnology halls were completed by the end of 1971 and are now being implemented and given physical form.

Since the closing of the Victoria Memorial Museum in November 1969 for extensive renovation and display redevelopment, exhibit planning and other display work for the seven major halls and for the travelling exhibition program has continued to occupy a large portion of staff time, reshaping as well as curtailing to some degree research and field work. Staff scientists attended a number of national and international conferences, lectured widely, acted as advisers for other institutions and countries, taught university courses, trained students, participated in planning exhibits in other museums and assisted with projects in other Canadian centres. The Museum's publication program has been substantially expanded, the Mercury series (in which manuscripts by Museum scientists are released in photocopy form in order to place them in the hands of students and faculty members as fast as possible) being particularly well received; and the Bulletin series of highly professional scientific writings was enlarged.

The National Museum of Science and Technology has the function of a cultural-educational institution, designed to bring scientific literacy to the visiting public and to familiarize them with the language, events and history of science. In the Museum, visitors are confronted with displays which, by means of artifacts and texts, demonstrate scientific principles and correlate them with the development of technology. Particular emphasis has been given to the technologies of ground transportation, aviation, agriculture, shipping and industry which have been so closely fused to the history of this nation.

The Museum displays are colourful and inventive, designed to involve people in the learning process. Visitors are asked to participate in experiments and in making things work; to explore the technological park; to ride in a double-decker bus or down a track in a gondola car; to push a button or wind a crank to learn some law of physics; or to sit in the driver's seat of a farm tractor or a giant steam locomotive. Museum collections are made available to other museums in Canada and abroad, with a view to bringing the story of science and technology to the widest audience possible. The National Aeronautical Collection, part of the Museum, is located in aircraft hangars at Rockcliffe, east of Ottawa. There are displayed some 50 of Canada's national collection of over 90 aircraft, together with engines and other artifacts relating to the development of aviation, so important in Canada and to which so many Canadian contributions have been made.

The Museum sponsors lectures on the history of science and technology. A systematic program of school tours for children in Ontario and Quebec has been developed to fit in with curriculum requirements. Broadly speaking, all programs are built around three general themes relating to national development — how man has overcome space and time in this vast land by various methods of transportation and communication; how man has changed his environment with science and technology and the tools he has built and used; and how man's living habits have changed as he moved from sod hut and log cabin existence to his present sophisticated environment. The Museum is planning publications to expand the content of its exhibits and to give popular accounts of Canadian scientific and technological achievements. The emphasis in the Museum is on being a bright, alert and lively showplace of the development and trends in modern science. New exhibits and temporary exhibits are added each year to make an approximate 20% annual change.

The National Museum of Science and Technology of Canada is in the vanguard of modern museums throughout the world which are emphasizing cultural-educational functions in lieu of traditional museum functions. Visitors to this Museum can have a meaningful experience in Canadian scientific and technological developments as well as in world advancements in these fields.

7.4.3 The Canada Council

The Canada Council was created in 1957 by an Act of Parliament, to "foster and promote the study and enjoyment of, and the production of works in the arts, humanities and social sciences". It carries out its task mainly through a broad program of fellowships and grants of various types. It also shares responsibility for Canada's cultural relations with other countries in co-operation with the Department of External Affairs. The Council is made up of a chairman, a vice-chairman and 19 members, all appointed by the Governor in Council. Its administration is headed by a director and an associate director, also appointed by the Governor in Council, and it meets at least five times a year.

Within the limits of the Canada Council Act, the Council enjoys a large measure of autonomy, setting its own policies and developing and carrying out its own programs in consultation with the community of artists and scholars. The Council reports to Parliament through the Secretary of State and also appears before the Standing Committee on Broadcasting, Film and Assistance to the Arts.

The Council's income is derived from three sources: an annual grant of the Canadian government which amounted to \$26.3 million for the year ended March 31, 1972; the Endowment Fund established by Parliament when it created the Council, which is expected to yield \$5 million annually; and private funds willed or donated to the Council and used in accordance with the wishes of the donors.

Assistance to the humanities and social sciences accounts for the larger part of the Council's budget, an amount of \$19.7 million in 1971-72. In support of research training, the Council awarded 2,395 doctoral fellowships totalling \$10.9 million; for research work, 263 leave and research fellowships totalling \$1.9 million and \$3.7 million in research grants; for research communication, a total of \$1.1 million in assistance to learned meetings, visiting professors, attendance of Canadian scholars at international conferences, and publication of learned journals and scholarly manuscripts. Through the Canadian Horizons Program, the Council spent \$339,000 to assist in projects to make Canada's cultural heritage better known to the public.

In the arts, the Council spent \$12.3 million of which \$1.7 million was used to finance some 780 grants, bursaries and awards to individuals in the various art forms, and \$10.3 million was applied to grants to organizations, including \$2.7 million for music, \$3.8 million for theatre, \$1.9 million for dance and opera, \$1.4 million for the visual arts and \$476,000 for writing and publication.

The Canada Council administers, on behalf of the Canadian government, part of a program of cultural exchanges with France, Belgium, Switzerland, the Federal Republic of Germany, Italy, the Netherlands and the Latin American countries, under which it awarded fellowships and grants totalling \$823,000 to citizens of those countries in 1971-72. The Council also administers the funds of the Canadian Cultural Institute in Rome, created in 1967 by an agreement between Canada and Italy. The Institute's income is used to provide a small number of fellowships for Canadian artists and scholars wishing to work or study in Italy. The Izaak Walton Killam Memorial Awards of the Canada Council were inaugurated in 1967 with funds from the Killam estate. These awards go to support a few scholars of exceptional ability engaged in research projects of far-reaching significance. In 1971-72, there were 21 awards made under this program, totalling \$580,000.

Under its power to "make awards to persons in Canada for outstanding accomplishments in the arts, humanities or social sciences", the Council annually awards three \$15,000 Molson prizes financed by a fund provided by the Molson Foundation. The Governor General's Literary Awards, financed by the Council, are awarded annually to six Canadian writers.

The Canada Council Act provides for certain functions in relation to the United Nations Educational Scientific and Cultural Organization. It has accordingly established a National Commission for UNESCO and provides its secretariat and budget. As an agent of the Council, the Canadian Commission for UNESCO co-ordinates UNESCO program activities abroad and administers a modest program in furtherance of UNESCO objectives.

7.4.4. Provincial assistance to the arts

Provincial governments, as well as other levels of government and industry, have during the past few years become more and more aware of the significance of the arts in the life of the community. All provinces except Newfoundland, Prince Edward Island and New Brunswick

now give some form of financial assistance to artists (writers, poets, painters and sculptors), cultural organizations or community councils. The assistance provided by each province is described in the following paragraphs.

Nova Scotia. This province has no specific legislation authorizing financial assistance for cultural advancement but the Department of Education, the Department of Finance and several other departments provide grants to a number of organizations. Payments are made under the Provincial Finance Act from departmental appropriations.

In the year ended March 31, 1971, grants by the Department of Education went to the Neptune Theatre, \$85,000; the Atlantic Symphony Orchestra, \$45,000; the Nova Scotia Museum of Fine Arts, \$15,000; the Maritime Conservatory of Music, \$7,500; the Nova Scotia Drama League, \$5,400; the Nova Scotia Festival of the Arts, \$7,000; the Nova Scotia Talent Trust, \$2,000; the Halifax Music Festival, \$500; and the Canadian Theatre Centre, \$750. Department of Finance grants were given to the Atlantic Symphony Orchestra, \$50,000; the Neptune Theatre Foundation, \$7,600; the Nova Scotia Museum of Fine Arts, \$15,000; and the Theatre Arts Festival International, \$15,000. The Department of Finance also provided a grant of \$2,000 to the Antigonish Highland Society (sponsors of the Antigonish Highland Games), and grants of \$1,000 each to the Festival of the Strait, the Pictou Lobster Carnival and the Nova Scotia Fisheries Exhibition and Fishermen's Reunion.

The Department of Trade and Industry in the same year gave a grant of \$2,000 to the Annapolis Valley Blossom Festival, and a grant of \$1,000 to the Acadian Festival of Clare. The Fine Arts and Handcrafts Activity of the Adult Education Program of the Department of Education operated under a budget of \$138,000 and disbursed small grants for instruction purposes to cultural organizations in the amount of \$3,400. The Nova Scotia Museum Activity of the Cultural Resources Program of the Department of Education operated with a budget of \$542,000 and disbursed grants totalling \$66,600 to local museums and historical societies. Other expenditures of the Department of Education included: Nova Scotia provincial libraries, \$1,054,300; publication and information, \$183,000; television education, \$67,300; visual education, \$53,700; and radio education, \$4,600.

Quebec. The Quebec Department of Cultural Affairs was set up in 1961. Since September 1970, it has developed along cultural lines involving four roles which lend themselves to government intervention: conservation, training, creative activities and dissemination. Each of these roles is emphasized in the administrative organization of the department which has four main Branches. The Conservation Branch on the one hand looks after conservation of the Quebec heritage and the restoration of those assets which form part of it, and on the other hand makes them known. The Training Branch brings together the conservatories of music and of dramatic art for which it supplies administrative and pedagogical co-ordination. The Creative Arts Branch aims at the development of the arts in Quebec, notably in the fields of music, literature, theatre, graphic arts and film. The Information Branch attempts to bring to every Quebec citizen both access to and participation in Quebec cultural life. The Department also has a Cultural Relations Branch whose role is to plan and co-ordinate the cultural policies of the Department outside Quebec.

The Creative Arts Branch, whose role is to assist in the development of the arts in Quebec, offered scholarships and grants to various categories of organizations and citizens in the fiscal year 1971-72. Twelve organizations received grants totalling \$683,860. In the field of music 22 organizations, including the *Opéra du Québec* founded in 1971, received a total of \$1.1 million; 52 artists who took part in the creative arts exhibition of Quebec each received \$500. In the field of literature, 10 literary organizations, societies, etc., received a total of \$72,400 and three reviews received publication grants amounting to \$9,830. Aid to Quebec publishers for the publication of 50 books totalled \$65,250; the viability of this operation was assisted by the purchase of books amounting to \$9,830. The Department has singled out the talent of one author in awarding the prestigious *Prix David* (\$5,000) and one scientist has received the Science Prize for the same amount. Twenty organizations, companies, etc., working in the field of theatre received \$923,000 for operational purposes. The aid to creative arts service allocated grants amounting to \$145,500 to 52 creative people in six fields, and in a seventh, grants amounting to \$115,000 were given to two organizations.

The Training Branch, which administers seven conservatories of music and two conservatories of dramatic art, made grants to seven musical training associations for a total of \$84,000.

The Information Branch, whose role is to enable Quebecers to have access to and participate in Quebec as well as world-wide culture, in addition to making grants of \$183,000 to 18 organizations and cultural centres, also gave financial assistance for 250 cultural presentations at a cost of \$190,627. In addition, a total of \$1.6 million was distributed in grants to 73 municipal libraries, 33 library associations and three central lending libraries; five librarians' associations received grants totalling \$28,500.

In the field of conservation, \$26,000 was paid out to various historical societies and \$52,246 to seven archaeologists and four scientists. Considerable amounts granted to the National Library of Quebec, the National Archives, the Quebec Museum and the Museum of Contemporary Art allowed these institutions to increase their collections and to acquire new works, and the number of visitors to these institutions has constantly increased. The Department also spent a total of \$477,484 during the fiscal year ended March 31, 1972 on preservation and restoration of historic monuments.

Place Royale in Quebec, the cradle of Canada, has gradually grown out of the ruins as a result of a Canada - Quebec agreement. As at March 31, 1972, \$7.1 million had been spent since the beginning of the project for acquisition of properties, restoration, professional fees (architects, engineers, lawyers, etc.) and for the administration of the project. At that date, Quebec had received \$3.2 million as the federal government's share in the project.

Other branches of the Department carried out various functions: expanding the French fact in North America and increasing cultural exchanges between France and Quebec; supplying teaching and administrative services for the conservatories of music and dramatic art; organizing an efficient and coherent library service throughout the province; preserving the artistic and historical heritage of the province and of its monuments through technical assistance and through grants to property owners, and overseeing the administration of museums.

Ontario. The Ontario government passed legislation in 1962 (SO 1962-63, c.6) establishing the Province of Ontario Council for the Arts, which consists of a chairman, a vice-chairman and ten other members, all appointed by the Lieutenant-Governor in Council. It is the function of the Council to promote the study, enjoyment and production of works in the arts, and to that end may assist, co-operate with and enlist the aid of organizations whose objects are similar to the objects of the Council; provide through appropriate organizations or otherwise for grants, scholarships or loans to persons in Ontario for study or research in the arts in Ontario or elsewhere or to persons in other provinces or territories of Canada or any other countries for study or research in the arts in Ontario; and make awards to persons in Ontario for outstanding accomplishments in the arts.

In the year ended March 31, 1972, a total of \$2.1 million was dispensed by the Council in the form of grants or project assistance. Of that amount, \$1.8 million was given in grants to 176 organizations, the largest of them to the National Ballet Guild of Canada, \$175,750; the Toronto Symphony Orchestra Association, \$166,750; the Toronto Arts Foundation, \$159,500; the Canadian Opera Company \$125,000; and the Stratford Shakespearian Festival, \$115,000. Grants to individuals amounted to \$88,850, of which \$56,300 were film grants and \$32,550 literary grants.

Thirty-five programs were assisted, the largest amounts going to Operation-Resource, \$48,056; concerts and artists, \$35,759; North-Western Ontario Regional Program, \$27,684; Theatre-Ontario, \$23,025; touring and sponsorship program, \$15,971; Ontario Sound '71, \$15,224; and Regional Artist-in-the-classroom, \$12,868.

In addition, the Ministry of Colleges and Universities allocated in the estimates for the fiscal year 1972-73 the following amounts: \$4.6 million to the Royal Ontario Museum, \$3.4 million to the Province of Ontario Council for the Arts, \$900,000 to the Art Gallery of Ontario, \$377,400 to the Royal Botanical Gardens, \$225,000 to the McMichael Collection of Art, \$225,000 to the Elliot Lake Centre for Continuing Education, \$96,000 in grants to local museums and \$37,000 to the Ontario Heritage Foundation.

Ontario Place. This 96-acre entertainment and exhibition complex, located on three man-made islands in Lake Ontario on the Toronto waterfront, opened on May 22, 1971. During its 1972 season (May 20 to October 9) it had 2,350,471 visitors, about 25% of whom came from outside Ontario, primarily from the United States.

The skills of Ontario film-makers were presented to 1,062,036 visitors in Cinesphere, the domed 800-seat theatre with a six-storey-high screen. Among the films shown were the

immensely popular IMAX-process film "North of Superior", and the IMAX-format spectacular "Labyrinth IV". IMAX is an Ontario-developed process which projects a 60x80-foot image on the giant screen, engulfing the audience in the sights and sounds of the picture.

In the Ontario Place Pavilion, multi-media exhibits created by Ontario writers, designers, artists and film-makers told the story of Ontario's past, present and future, using three-dimensional film, sound, slides and artifacts.

A new feature of the Ontario Place 1972 season was the Children's Village, which opened on July 2, 1972. This two-acre area offers over 20 novel play activities for children from pre-school to teens. A 40,000-sq-foot canopy permits fun and play, rain or shine.

The Forum, an 8,000-seat outdoor amphitheatre, presented a wide spectrum of entertainment during the summer season, from concerts by the Toronto Symphony, which attracted an estimated 130,000 people, to rock and jazz concerts, opera, Indian Days, country and western, and national cultural programs.

In addition to these attractions, Ontario Place offers a variety of restaurants, lounges and snack bars, a 320-boat marina, gift boutiques, land and water rides, and the distinguished Canadian World War II destroyer, HMCS Haida, which is permanently berthed at the site and may be visited during the Ontario Place season.

Manitoba. The Manitoba Arts Council was formed by legislation passed in 1965, providing for a chairman, vice-chairman and ten members appointed by the Lieutenant-Governor in Council, with the objective of promoting the study, enjoyment, production and performance of works in the arts, by assisting and co-operating with those organizations involved in cultural development; providing for grants, scholarships or loans to Manitobans for study or research in the arts and making awards to citizens of Manitoba for outstanding accomplishments in the arts. Working on a budget of \$304,000, the Manitoba Arts Council in the year ended March 31, 1972 made grants to 27 organizations, including \$56,300 to the Manitoba Theatre Centre, \$37,000 to Rainbow Stage, \$62,000 to the Royal Winnipeg Ballet and \$66,000 to the Winnipeg Symphony Orchestra.

The Manitoba Arts Council has served as the advisory body to the city of Winnipeg in distribution of its funds to assist cultural organizations, and worked closely with the business community in setting up the first Canadian Business and the Arts Conference, held in 1971.

Saskatchewan. In 1949, the Saskatchewan Arts Board was established by Act of the Legislature, with the stated aim of providing "opportunity for the people of Saskatchewan to participate in visual art, music, drama, literature, handicrafts and other cultural pursuits; to stimulate and encourage this participation and appreciation". The means of achieving these aims were left to the judgement of the Board.

The Saskatchewan Arts Board, funded by the provincial government but functioning independently, is composed of not less than seven nor more than 15 volunteer members appointed annually by the Lieutenant-Governor in Council. These members are from all parts of the province but represent no specific areas or any specific disciplines in the arts. The work of the Board is carried out by a staff of two consultants and three office personnel under an executive director. Experts in various fields of the arts are engaged for specific projects where their special talents are required.

Over the years, handicraft, visual and performing arts programs have been expanded to the point where in some areas they have reached the professional level. Workshops, lectures and seminars at an advanced level have been sponsored by the Board, and considerable assistance has been given to local arts and crafts organizations in sponsoring similar projects at a local level. In most cases, the Board is not an instigator but prefers to assist established organizations in carrying out their own programs.

A highly successful Saskatchewan Summer School of the Arts, operated annually by the Saskatchewan Arts Board at Echo Valley Centre near Fort Qu'Appelle, offers one-to-four-week courses in band, orchestra, stage band, choral singing, piping and drumming, highland and national dancing, ballet, painting, pottery, acting, creative writing and weaving, with instruction by highly qualified teachers.

For five years from 1965, the annual month-long Saskatchewan Festival of the Arts focused attention on the arts in communities throughout the province by presenting

top-calibre artistic performances and exhibitions. This Festival concept has been replaced by similar programs planned by individual communities to meet their specific needs.

Each year, the Board has provided financial assistance to individual provincial artists to help them further their artistic training, or to establish themselves at a professional level. Individual assistance is based primarily on financial need, with scholarship and artistic ability as important factors. Emphasis is placed on assisting those in undergraduate studies or those striving to achieve professionalism. In 1972, the Board awarded a total of \$19,394 in individual assistance to 31 applicants.

The total budget of the Board in 1972 was \$360,500. Financial assistance extended to organizations included \$29,000 to Globe Theatre Productions Limited, \$3,400 to Hone-James Studio, \$1,950 to the Kinsmen International Band Festival, \$1,500 to the National Theatre School, \$1,500 to the National Youth Orchestra, \$4,693 to provincial arts councils, \$25,000 to the Regina Symphony, \$25,000 to the Saskatoon Symphony, \$1,000 to the Saskatchewan Junior Concert Society, \$16,500 to the Saskatchewan Music Festival Association, \$1,500 to the Saskatchewan Region Dominion Drama Festival, \$10,000 to Theatre Canada '72, \$1,000 to the Saskatchewan Society for Education Through Art, \$725 to the Saskatchewan Writers' Guild, \$9,895 to the Saskatchewan Youth Band, Orchestra and Chorus, \$1,000 to The Group (photographers), \$2,000 to the Norman Mackenzie Art Gallery in Regina and \$4,000 to the Mendel Art Gallery in Saskatoon. In all, major assistance totalling \$161,063 was awarded to 22 groups and organizations during 1972.

Alberta. The Cultural Development Branch of the Department of Culture, Youth and Recreation was set up after passage of an Act of the Legislature in 1946 providing for "encouragement of the cultural development of the people of this Province". The Act has since been amended several times to give it greater flexibility. The Branch is interested in the promotion of all forms of art and public libraries. Its program is intended to give opportunity to the public to witness the best in performing arts tours, exhibitions, etc., in order to gain their initial excitement and interest in the various modes and expressions in the arts; to conduct training courses at regular intervals for a variety of leaders, with special emphasis on in-service training for teachers in the public school system and instructors at special institutions operating programs that develop arts according to the needs of the individual, such as those for the mentally and physically handicapped, the aged, or inmates of penal institutions; to provide consultative services for cultural organizations throughout the province; and to give financial assistance to individuals, local amateur and professional institutions and provincial government organizations whose aims are the development of the arts. Awards to individuals wishing to further their training in some form of the arts amount to \$50,000 annually. The Alberta Art Foundation was formed by legislation in 1972, and has been allocated \$50,000 annually for the purchase of Alberta arts and crafts. The budget of the Branch for the year ended March 31, 1973 was nearly \$1.7 million.

British Columbia. The British Columbia Cultural Fund was set up by statute in 1967. That Act set aside \$5 million in an endowment-type fund, the interest from which was to be spent "for stimulation of the cultural development of the people of the Province". In September of that year, an advisory committee was established to receive applications for cultural grants and to report their recommendations to the Department of Finance for the issuance of the necessary funds. The amount of the endowment was raised to \$10 million in 1969, and raised again in 1972 to \$15 million.

Up to December 31, 1972, grants totalling \$3.6 million had been awarded by the Fund to support cultural activities throughout the province. The Fund also provides a small degree of financial support to the National Theatre School, the National Youth Orchestra and the Canadian Theatre Centre.

Grants totalling \$861,572 were made in the fiscal year 1971-72, compared with \$818,168 in the previous year, of which about 75% (\$641,121 in 1971-72 and \$611,694 in 1970-71) was given to major non-profit organizations such as symphony, drama and opera societies. About 19% of the grants in each year went to community arts councils and the remainder to scholarships, seminars and miscellaneous grants. For the fiscal year 1972-73, grants totalling \$826,081 had been made up to December 31, 1972, including for the first time an allocation for art acquisitions which amounted to \$34,650.

7.5 Public archives and library services

7.5.1 The Public Archives

The Public Archives was established in 1872 and now operates under the direction of the Dominion Archivist by authority of the Public Archives Act. It serves a dual role. As a research institution, it is responsible for acquiring from any source all significant documents relating to the development of the country and of value to Canada, and for providing suitable research services and facilities to make this material available to the public. As an essential part of the government administration, it has broad responsibilities in regard to the promotion of efficiency and economy in the management of its records.

The Historical Branch comprises four Divisions. The Manuscript Division contains manuscript collections and public records. The manuscript collections include private papers of statesmen and other distinguished citizens, records of cultural and commercial societies, and copies of records relating to Canada and now held in France, England and other countries; public records consist of selected records of all departments and agencies of the Government of Canada. The Picture Division has charge of documentary paintings, water colours, engravings and photographs relating to people, historical events, places and objects; it also has an extensive collection of films and sound recordings. The Map Division has custody of thousands of maps and plans pertaining to the discovery, exploration and settlement of this country and its topography, as well as a large collection of current topographical maps of foreign countries. The Library contains more than 80,000 volumes on Canadian history, including numerous pamphlets, periodicals and government publications.

Although documents in the Archives may not be taken out on loan, they may be consulted in the building, and a 24-hour-a-day service is provided for accredited research workers. Reproductions of available material may be obtained for a nominal fee on request and many of the documents in the Manuscript Division are on microfilm which may be obtained on interlibrary loan.

The Records Management Branch assists departments and agencies in the setting up and operation of their records management programs. Its service also includes recommendations and advice on scheduling and disposal of records. At the Ottawa, Toronto, Montreal and Vancouver records centres, it provides storage, reference service and planned disposal of dormant records on an economical basis. Other regional centres are being established in major cities across Canada.

The Administration and Technical Services Branch, in addition to an extensive conservation and restoration program, provides a technical and advisory service on microfilming to government departments and agencies. Microfilm work is done for departments at cost. It also provides a full range of services to the National Library.

Branch offices of the Public Archives are located in London, England and Paris, France. The Archives also administers Laurier House as a historical museum.

7.5.2 Library services

7.5.2.1 The National Library

The National Library was formally established on January 1, 1953 by Act of Parliament. On the same date it absorbed the Canadian Bibliographic Centre, which had been engaged in preliminary work and planning since 1950. The Library is now governed by the National Library Act, 1969 which broadened the powers of the National Librarian to whom is assigned the responsibility of co-ordinating government library services. The Act established a National Library Advisory Board consisting of 15 members.

The book collection now consists of more than 400,000 volumes, supplemented by microcopies of more than 100,000 additional titles. Newspaper files formerly in several locations have been brought together and now form the largest collection of Canadian newspapers in Canada.

The Library compiles and publishes *Canadiana*, a monthly catalogue of publications relating to Canada. It includes bibliographic descriptions of trade publications, official publications of the Government of Canada and the ten provinces, and films, filmstrips and phonograph records produced in Canada, in addition to works by Canadians and material on Canada published abroad. More than 24,000 titles were included in 1972. Retrospective bibliographies are planned or in progress, with *Canadiana, 1867-1900*, now being reviewed for publication.

The Canadian Union Catalogue lists over 10 million volumes in about 300 government, university, public and special libraries in all provinces. New accessions (which numbered over 1.5 million in 1971-72) are reported regularly, and the Union Catalogue thus forms a continuously up-to-date key to the main book resources of the country. During the year ended March 31, 1972, the Reference Division was asked to locate more than 110,000 titles, and it is noteworthy that copies of 78% of them were found in Canadian libraries.

The Library has published a union list of serials in the fields of the humanities and social sciences currently received by Canadian libraries. This list is a first step toward a complete union list of such serials in the humanities and social sciences that will complement the *Union list of scientific serials in Canadian libraries* published by the National Science Library.

A list of books about Canada, prepared by the National Library, appears in Appendix 5.

7.5.2.2 The National Science Library

The functions and services of the National Science Library are described in Chapter 9, Section 9.2.1.

7.5.2.3 Public libraries

Public libraries in Canada are organized under provincial legislation which specifies the method of establishment, the services to be provided and the means of support. Municipalities may organize and maintain public libraries or join together to form regional libraries according to provincial legislation. Provincial public library agencies advise local and regional libraries and distribute grants as provided.

Table 7.23 gives summary results of the annual public library survey for 1971, with comparable totals for 1970 and 1969. Book circulation was 97.3 million or 4.5 per capita. The current operating payments of all public libraries amounted to \$70.8 million or \$3.28 per capita compared with \$2.91 in the previous year. The full-time staff numbered 5,261 in 1971 of whom 1,252 or 23.8% were professional librarians.

7.5.2.4 Libraries in universities and colleges

Libraries in 108 universities (including four-year affiliated or associated institutions) reported, for the academic year 1970-71, a total of 24.1 million volumes or 78.4 per full-time student. Expenditures of university libraries amounted to \$79.7 million or \$259 per full-time student. The total full-time staff of the libraries numbered 6,776, of whom 1,537 or 22.7% were professional librarians. Details by province are given in Table 7.24.

Table 7.24 also shows that libraries in 143 colleges (post-secondary institutions such as community colleges, CEGEPs, colleges of applied arts and technology, teachers' colleges, etc.) reported a total book stock for 1970-71 of 4.3 million volumes or 30.5 per full-time student. Expenditures of these libraries amounted to \$10.5 million or \$73.89 per full-time student. Total library staff was 912 of whom 245, or 26.9%, were professional librarians.

¹ Universities are defined as degree-granting institutions including affiliated, associated and federated colleges if these offer four-year academic programs leading to degrees which are granted by the parent university.

² Colleges are defined as post-secondary, non-degree-granting institutions offering technical and university transfer programs of one to four years duration. In addition, these may offer other levels of courses of less than one year in vocational and extension programs.

Chapter 8

Labour

8.1 The government in relation to labour

8.1.1 Canada Department of Labour

Established in 1900 under the Conciliation Act, which involved the federal government in preventing and settling labour disputes, the Canada Department of Labour was formed to investigate important industrial questions and to collect, analyze and publish statistical and other information related to Canadian labour conditions. It also administered the Fair Wages Policy, adopted in the same year to protect people employed on federal government contracts and on projects supported by public funds. The Department's work focused on two areas, industrial relations and manpower supply, until January 1, 1966 when all manpower activities were transferred to the Department of Manpower and Immigration.

The industrial relations legislation now administered by the Canada Department of Labour applies to employers, employees and trade unions within federal jurisdiction. The Department is responsible for conciliation procedures in industrial disputes, investigating complaints of unfair labour practices, refusals to bargain and violations of legislation, processing trade union applications for certification and decertification and conducting representation votes. It determines wage rates and hours of work as far as federal government contracts for construction or supplies are concerned, and promotes improved industrial relations through joint union-management consultation and by preventive mediation through industry specialists. The Department is also responsible for administering assistance granted under the Automotive Manufacturing Assistance Regulations and the Adjustment Assistance Benefits Program for displaced workers in the textile and clothing industries.

Much of the legislation regulating employment practices, labour standards, safety and industrial regulations was integrated in the Canada Labour Code which came into force on July 15, 1971. It is discussed later in this chapter.

The Department's over-all objective is to achieve economic and social progress by establishing a climate of good industrial relations promoted through three main programs: the Industrial Relations program encompassing the Conciliation and Arbitration Branch, the Employee Representation Branch, the Fair Employment Practices Branch and the Labour-Management Consultation Branch; the Employment Standards program covering the Labour Standards Branch, the Accident Prevention and Compensation Branch and the Women's Bureau; the Research and Development program comprising the Economics and Research Branch, the International Labour Affairs Branch, the Legislative Research Branch and Library Services.

The Department maintains records of labour legislation in the provinces and in other countries and provides liaison between the International Labour Organization and the federal and provincial governments. As part of a broad publication program it publishes the monthly *Labour Gazette*.

8.1.2 Department of Manpower and Immigration

The Department of Manpower and Immigration recruits and develops manpower resources in line with the needs of the economy. Two main sources are used to supply the labour market: counselling and, where necessary, training and relocation to employ domestic workers; and introduction of new manpower through immigration.

Operations Canada distinguishes the Department's domestic field activities from those at head office and at offices abroad; it comprises five regional headquarters, some 390 Canada Manpower Centres and 95 Immigration Centres in Canada. Regional directors-general, responsible for both manpower and immigration activities in the field, report to the Assistant Deputy Minister, Operations, at head office. The objectives of Operations Canada are: to provide an effective employment service for both workers and employers through strategically located Canada Manpower Centres, to help workers attain their full potential through counselling or referral to skill development and upgrading programs; to assist employers in recruiting skilled workers and in long-range manpower planning by providing up-to-date

occupational and labour market information; to help labour and management adapt to technological change by assisting them to co-operate in manpower adjustment programs; to provide reception, settlement and job placement services for immigrants; and to process documents for international travellers and enforce the Immigration Act and Regulations within Canada, providing facilities to handle applications from Canadians wishing to sponsor or nominate relatives.

In the fiscal year ended March 31, 1972, Canada Manpower Centres assisted some 902,000 persons, excluding casual workers, to find continuing employment, and referred an additional 308,000 clients to full- or part-time courses under the Canada Manpower Training Program. In the same period, some 17,000 clients were referred to federal-provincial rehabilitation programs, and more than 70,000 workers and trainees were granted moving and transportation assistance under the Canada Manpower Mobility Program.

Manpower Division. Under the direction of the Assistant Deputy Minister, Manpower, the Division's four branches administer employment programs and services through Canada Manpower Centres. The Employer Services Branch deals with the demand side of the labour market, providing guidelines in the development and utilization of employment services for employers and specialized information on industrial needs. The Branch directs the operations of the Canada Manpower Consultative Service which assists industries undergoing manpower dislocations as a result of technological change. It also administers the Canada Manpower Mobility Program to facilitate the movement of workers to areas of job opportunity. The Manpower Utilization Branch is concerned with the supply side of the labour market. It formulates policies and guidelines for employment counselling and aptitude and achievement tests used by Canada Manpower Centre counsellors. The Branch also administers programs to assist new members of the labour force and students seeking summer employment. The Manpower Training Branch directs programs to help improve the qualifications of under-employed, unemployed or disadvantaged adult workers. Training courses are purchased from provincial or private schools or through contracts with employers, and participants receive wage reimbursements or training allowances. The Special Programs Branch co-ordinates the application of all manpower programs and services to the needs of disadvantaged unemployed persons in the labour force.

In 1972-73 the federal government continued the Special Employment Plan, introduced in October 1971, to alleviate seasonal unemployment while upgrading the skills of workers and contributing to community improvement and economic growth. The Department of Manpower and Immigration is responsible for two elements of the Plan: the Local Initiatives Program, which in 1971-72 produced some 92,500 jobs through 5,700 community projects conceived, organized and managed by private citizens and funded by the Department; and the Canada Manpower Training-on-the-Job Program through which more than 42,500 jobs were created in the winter of 1971-72 by some 12,300 training contracts between private employers and the Department.

Immigration Division. Under the Assistant Deputy Minister, Immigration, the Division is responsible for administering the Immigration Act and Regulations. The Division operates a Foreign Service to select, examine and move immigrants to Canada, and a Home Service Branch which provides procedural guidelines for field operations in Canada including admission of immigrants and non-immigrants, apprehension of persons who contravene Canadian laws after being admitted or gaining illegal entry, and removal from the country of those liable to deportation.

Program Development Service. Under the direction of an Assistant Deputy Minister, this Service performs a research, development and evaluation function. It provides labour market information for Canada Manpower Centres, immigration offices and other government departments, and measures the over-all social and economic impact of the Department's policies.

Administration Division. Headed by an Assistant Deputy Minister, the Administration Division comprises units responsible for providing professional and technical support to line management: information service, personnel, financial management, data processing, organization and methods, security and general administrative services.

8.1.3 Federal and provincial labour legislation

8.1.3.1 Jurisdictions

The Canada Labour Code (RSC 1970, c.L-1) applies only to federal undertakings and any other operations that Parliament declares are for the general advantage of Canada or two or more of its provinces. The Code consolidated previous legislation regulating employment practices, labour standards, etc., in the federal jurisdiction.

Because it imposes conditions on the rights of the employer and employee to enter into a contract of employment, labour legislation is, generally speaking, law in relation to civil rights and provincial legislatures are authorized to make laws in relation both to local works and to property and civil rights. Power to enact labour legislation has become, therefore, largely a provincial prerogative, under which a large body of legislation has been enacted affecting the employment relationship in such fields as working hours, minimum wages, the physical conditions of workplaces, apprenticeship and training, wage payment and wage collection, labour-management relations and workmen's compensation.

8.1.3.2 Federal labour legislation

Industrial relations. Part V of the Canada Labour Code (Industrial Relations) contains the former Industrial Relations and Disputes Investigation Act of 1948. In general, it provides that employees and employers have the right to organize and bargain collectively and that trade unions may be certified as sole bargaining agents for employee groups. Trade unions and employers are required, on notice, to bargain collectively in good faith. Part V of the Code also provides for assistance by conciliation officers and conciliation boards in reaching collective agreements. Employees may change bargaining agents at such times and under such conditions as are set out in this Part of the Code, which also prescribes conditions affecting the duration and renewal of collective agreements. The latter must also provide for the arbitration of disputes concerning their meaning or violation. Part V prohibits unfair labour practices, i.e., the interference with or domination of trade unions by employers or interference, discrimination and coercion in trade union activity. The conditions that must be observed prior to strike and lockout action are also set down.

Industrial inquiry commissions may be appointed to investigate industrial matters or disputes. The Minister of Labour is charged with administering the Code and is directly responsible for the provisions affecting the appointment of conciliation officers, conciliation boards and industrial inquiry commissions, consent to prosecute, and complaints that the Act has been violated or that a party has failed to bargain in good faith.

The Canada Labour Relations Board administers provisions concerning the certification of bargaining agents and, on referral by the Minister, investigates complaints that a party has failed to bargain collectively and to make every reasonable effort to conclude a collective agreement.

Fair employment practices. Part I of the Canada Labour Code (Fair Employment Practices) contains the provisions of the former Fair Employment Practices Act of 1953. It prohibits discrimination in employment based on race, national origin, colour or religion, discrimination by trade unions in regard to membership or employment, the use by employers of employment agencies that practise discrimination, and the use of advertisements or inquiries in connection with employment that express, directly or indirectly, any limitation, specification or preference as to race, colour, religion or national origin.

Labour standards. Part III of the Canada Labour Code (Labour Standards) replaced the Canada Labour (Standards) Code of 1965. The equal pay provisions of Part II of the Code were incorporated by amendment into Part III. The amendment introduced regulations regarding maternity leave, notice of group and individual termination of employment, severance pay and wage garnishment. Changes were also made in the coverage of the legislation and in provisions governing hours of work, minimum wages, annual vacations and general holidays.

The Code sets both standard and maximum hours of work. The overtime rate (one and a half times the regular rate) must be paid after eight hours in a day and 40 hours in a week, to a maximum of 48 hours in a week. Hours may be averaged when an employee's schedule of hours varies from day to day or week to week because of the nature of the work. If the Minister

of Labour is satisfied that exceptional circumstances justify the additional hours, he may issue a permit allowing an employee to exceed the maximum hours. The Governor in Council may make regulations varying the standard and maximum hours for classes of employees in any specified industrial establishment where the Code standards would be unduly prejudicial to the interests of the employees or seriously detrimental to the operation of the establishment. An inquiry must be held before such regulations may be made.

The minimum wage is \$1.90 per hour for all persons 17 years of age or over and \$1.65 per hour for persons under 17 years of age. The Governor in Council may issue orders from time to time increasing the minimum rate.

Employees are entitled to a two-week vacation with pay each year and a holiday with pay on each of the eight general holidays, or substitutes for them.

An employer must give advance notice to the Minister of Labour and the union, with a copy to the Department of Manpower and Immigration, when dismissing 50 or more employees during a four-week period. The length of notice varies according to the number of employees being dismissed: 50-100 employees, eight weeks; 101-300 employees, 12 weeks; more than 300 employees, 16 weeks. In addition, the employer and the trade union must provide the Department of Manpower and Immigration with whatever information it requests to assist the employees. The requirement to give notice may be waived for an industrial establishment or a specified class of employees by an order of the Minister of Labour, subject to any terms or conditions that he may determine.

Under the Code's provisions respecting individual dismissals, every employee with three months service (except a manager, superintendent or member of a profession) is entitled to two weeks notice of termination of his employment. In lieu of such notice, he is entitled to two weeks wages at his regular rate for his regular hours of work for each completed year of employment, up to a maximum of 40 days wages. However, the employer is not required to give severance pay to an employee who is dismissed for just cause or to a person who, on termination of employment, is entitled to a retirement pension.

The maternity protection provisions grant 17 weeks of maternity leave — 11 weeks before and six weeks after childbirth — and ensure job security to women absent from work because of pregnancy. To be eligible for maternity leave, a woman must have been continuously employed by her employer for 12 months. The Code provides for voluntary prenatal leave up to 11 weeks before the anticipated date of delivery, and this period extends to the actual date of confinement.

The Code prohibits an employer from paying men and women employees at different rates if they work in the same establishment at equally demanding jobs under the same or similar conditions and also prohibits an employer from dismissing, laying off or suspending an employee solely because of garnishment.

Safety of employees. Part IV of the Canada Labour Code (Safety of Employees) incorporates the Canada Labour (Safety) Code of 1968, which was the first general safety legislation passed by the Parliament of Canada. To ensure safe working conditions for all employees in industries and undertakings under federal jurisdiction, Part IV: provides for all the elements of a complete industrial safety program; obliges employers and employees to perform their duties in a safe manner and authorizes the making of regulations for dealing with occupational safety problems; complements other federal laws and provincial legislation; authorizes advisory committees and special task forces to assist in developing the program under continuous consultation among federal and provincial government departments, industry and organized labour; and provides for research into causes and prevention of accidents and for an extended safety education program. Regional safety officers and federally authorized provincial inspectors apply the safety regulations.

As at January 31, 1972, regulations were in force governing coal mine safety, elevating devices, first aid, machine-guarding accident investigation and reporting, noise control, hand tools, fire safety, temporary work structures, confined spaces, and adequate lighting.

Fair wages policy. Wages and hours on government construction contracts are regulated by the Fair Wages and Hours of Labour Act and Regulations. The rates are never less than the minimum hourly rate prescribed by Part III (Labour Standards) of the Canada Labour Code. Wages and hours of work on contracts for equipment and supplies are regulated by Order in Council.

8.1.3.3 Provincial labour legislation

Industrial relations. All provinces have legislation similar in principle to Part V of the Canada Labour Code, designed to establish harmonious relations between employers and employees and to facilitate the settlement of industrial disputes. These laws guarantee freedom of association and the right to organize, establish machinery (labour relations boards or other administrative systems) for the certification of a trade union as the exclusive bargaining agent of an appropriate unit of employees, and require an employer to bargain with the certified trade union representing his employees.

Alberta, Ontario and New Brunswick have special provisions for accrediting employer organizations in the construction industry; in British Columbia accreditation provisions are not limited to the construction industry. Most of the laws require the parties to comply with the conciliation or mediation procedures laid down in the legislation before a strike or lockout may legally take place; every collective agreement must provide machinery for settling disputes arising out of the agreement, and prohibit strikes and lockouts while an agreement is in effect. All of them prohibit defined unfair labour practices and prescribe penalties. In some provinces, certain groups such as public servants, policemen, firemen, teachers and hospital workers are governed by special legislation.

Hours of work. Hours are limited in Alberta and British Columbia to eight a day and 44 a week, and in Ontario to eight a day and 48 a week. The Ontario Act requires, with some exceptions, that one and a half times the regular rate be paid for work done, under permit, beyond the 48-hour limit. The Manitoba and Saskatchewan Acts do not limit daily and weekly hours but require the payment of one and a half times the regular rate if work is continued after eight and 44 hours in Manitoba and eight and 40 in Saskatchewan. Some exceptions are provided for in all five Acts.

Minimum wages. All jurisdictions have enacted minimum wage legislation to ensure adequate living standards for workers. These laws vest authority in a minimum-wage-fixing board or the Lieutenant-Governor in Council to establish minimum wages for employees. In most provinces, minimum wage orders now cover almost all employment except farm labour and domestic service; however, farm labourers are covered in Newfoundland and certain farm-related occupations are covered in Ontario. Minimum rates set by the orders apply throughout the province and, except in Prince Edward Island, are the same for both sexes. Most jurisdictions also set special minimum rates for young workers.

As at January 1, 1973, the provincial and territorial minimum hourly wage rates for experienced adult workers were as follows: Newfoundland \$1.40, Prince Edward Island \$1.25 (men) and \$1.10 (women), Nova Scotia \$1.55, New Brunswick \$1.50, Quebec and Ontario \$1.65, Manitoba, Saskatchewan and Alberta \$1.75, British Columbia \$2.00, Yukon Territory \$1.75 and Northwest Territories \$1.50. The federal rate was \$1.90.

Regulation of wages and hours in certain industries. Apart from general hours-of-work laws, other statutes regulate working hours in some industries. Industrial standards legislation is in effect in Newfoundland, Prince Edward Island, Nova Scotia, New Brunswick, Ontario, Saskatchewan and Alberta. These laws provide that a schedule of wage rates and hours of work agreed on by a representative group of employees and employers in an industry or trade may, with government approval, be given statutory effect by Order in Council. Such wage rates and hours then become the minimum terms of employment for the entire industry or trade in the area. An advisory committee, usually equally representative of employers and employees, is established to assist in enforcing a schedule. This type of legislation is used fairly extensively in the building trades, the clothing industries, barbering, and a few other industries. In Newfoundland, Nova Scotia and New Brunswick, schedules have been issued only for certain construction trades in some areas. In Ontario, schedules for the garment trades and the fur industry apply throughout the province and a substantial number of schedules apply to various construction trades and to barbering in specified areas.

Under the Quebec Collective Agreement Decrees Act, certain terms of a collective agreement, including those dealing with hours and wages, may be made binding on all employers and employees in the industry concerned in a defined area, provided the parties to the agreement represent a sufficient proportion of the industry. The standards made binding

under this procedure are contained in a decree, which has the force of law. Approximately 85 decrees applying to the garment trades, barbering and hairdressing, commercial establishments, garages and service stations, and other industries and services are in effect; a number of them apply throughout the province. Working conditions in the construction industry are governed by decrees under a separate Act — the Construction Industry Labour Relations Act, 1968.

The Construction Industry Wages Act in Manitoba, which applies to both private and public construction work, provides for setting minimum wage rates and maximum hours of work at regular rates for employees in the construction industry, on the recommendation of a board equally representative of employers and employees, with a member of the public as chairman. Under this Act, annual schedules set the regular work week and hourly wage rates for various classifications of workers in the heavy construction industry, in the Greater Winnipeg building construction industry, and in rural building construction.

Annual vacations and public holidays. All provinces have annual vacations legislation applicable to most industries. The general standard is two weeks. In Ontario workers are entitled to a one-week vacation after the first year of employment, and two weeks after the second and each subsequent year and, in Manitoba and Saskatchewan, three weeks after five years of service. Alberta, British Columbia, Manitoba, Nova Scotia, Ontario and Saskatchewan have enacted legislation of general application dealing with public holidays. The number of holidays varies from seven to nine and the provisions for payment also vary.

Vacation pay equals 4% of annual earnings in Newfoundland, Nova Scotia, Prince Edward Island, New Brunswick, Quebec and Ontario (2% in the first year); in Manitoba and Alberta, regular pay; and in Saskatchewan 1/26th of annual earnings in the first four years and 3/52nds of annual earnings after the fifth year. The federal rate is 4%.

Termination of employment. In Nova Scotia, Saskatchewan and Prince Edward Island an employer must give an individual employee one week's written notice of termination; in Manitoba and Newfoundland, one regular pay period. In Ontario, the length of notice varies with the period of employment: three months to two years, one week; two to five years, two weeks; five to ten years, four weeks; ten years or more, eight weeks. Quebec requires the employer of a domestic, a servant, journeyman or labourer to give one week's notice of termination if the employee is hired by the week, two weeks' notice if hired by the month, and a month's notice if hired by the year. Newfoundland, Nova Scotia, Prince Edward Island, Quebec and Manitoba require an employee to give similar notice on quitting his job.

In addition, Ontario and Quebec require an employer to give advance notice of a projected termination of employment or lay-off of a group of employees. The Ontario group notice requirement applies when an employer plans to terminate the employment of 50 or more persons within four weeks or less. The length of notice is related to the number of workers involved: 50-200, eight weeks; 201-500, 12 weeks; 501 or more, 16 weeks. The Quebec group notice requirement applies when an employer contemplates the dismissal of ten or more employees within a period of two months. Again, the length of notice required varies with the number of workers involved: 10-100, two months; 101-300, three months; 301 and over, four months.

Maternity protection. Five provinces have legislation to ensure the health and job security of women workers before and after childbirth. The Ontario, British Columbia and New Brunswick Acts provide for six weeks leave before childbirth and six after; the Manitoba and Nova Scotia Acts allow 11 weeks before and six after. Except in New Brunswick the postnatal leave is compulsory, unless a medical doctor authorizes an earlier return to work. In all five provinces, the right to maternity leave is supplemented by a guarantee that an employee will not lose her employment because of absence on maternity leave.

Anti-discrimination laws. All provinces have adopted fair employment practices laws forbidding discrimination in hiring, in conditions of employment and in trade union membership on grounds of race, colour, religion and, except Prince Edward Island, sex.

In British Columbia, Alberta, Ontario and Newfoundland, discrimination in employment and trade union membership on grounds of age is prohibited. All provinces but Prince Edward Island have provisions in separate equal pay Acts or in human rights or labour standards legislation that forbid discrimination in rates of pay solely on the basis of sex.

Apprenticeship. All provinces have apprenticeship laws providing for an organized procedure of on-the-job training and school instruction in designated skilled trades, and statutory provision is made in most provinces for issuing qualification certificates, on application, to qualified tradesmen in certain trades. In some provinces, legislation is in effect making it mandatory for certain classes of tradesmen to hold a certificate of competency.

Accident prevention. In most provinces factory or industrial safety Acts and workmen's compensation boards regulate conditions of sanitation, heating, lighting and ventilation and prescribe machine-guarding practices to protect the health and safety of workers. Legal standards control the design and operation of mechanical equipment, electrical installations, the use of gas- and oil-burning machinery and radiation-producing equipment such as laser sources, and set qualifications for workers using such equipment. Construction and excavation work are also regulated by specified safety standards.

Workmen's compensation. All provinces have legislation providing for compensation payments in cases of accidental injury at work or to persons disabled as a result of a specified industrial disease. To be entitled to benefits, a worker must be employed in an industry covered by the Act at the time of injury. Compensation is not payable, however, where the disability lasts less than a stated number of days (varying from one to four in the provincial Acts), or where the injury is due to the worker's own misconduct. An employee who is entitled to compensation has no right of action against his employer for injury sustained during employment.

The Acts provide for a compulsory system of collective liability on the part of employers. Industries covered are divided into classes or groups, according to hazard. Employers are required to contribute to the Accident Fund at a rate set according to the accident experience of the class or group. Each class is liable for the costs of all accidents occurring in that class.

The laws apply to enumerated categories but the range of industries covered by each Act is very wide. The principal exceptions are farm workers (who are not covered except in Ontario), domestic servants, casual workers, employees of financial, insurance and professional undertakings, employees of non-profit religious or charitable organizations, and workers in certain service industries in most provinces, for example, barber shops and beauty parlours. Enterprises with fewer than a specified number of employees are exempted from the Act in some provinces, but generally may be included if the employer applies for coverage.

Benefits for disability are based on 75% of earnings, subject to an annual ceiling. Where disability is permanent, a life pension is paid, irrespective of future earnings. Medical benefits are provided without limitation, regardless of a waiting period, and rehabilitation services are available where necessary. Where death results from an employment injury, prescribed monthly payments are made to dependants. Compensation benefits in Quebec and British Columbia are tied to the cost-of-living index. All the provinces frequently review and increase the scales and ceilings of compensation benefits.

A federal Act provides for accident compensation for federal government employees according to the scale of benefits provided by the Act of the province in which the employee is usually employed. Seamen who are not under a provincial Workmen's Compensation Act are entitled to compensation under the federal Merchant Seamen Compensation Act.

All provincial workmen's compensation legislation was amended in 1972, increasing benefits in most provinces. The ceiling on maximum annual earnings on which compensation payments are based was increased from \$6,600 to \$7,600 in Alberta, and in British Columbia from \$7,600 to \$8,600, effective January 1, 1973. In Saskatchewan, the ceiling was raised from \$6,600 to \$8,400 and the average weekly earnings on which the amount of compensation is based was raised from \$126.92 4/13 to \$161.53 11/13, effective July 1, 1972.

Four provinces amended provisions governing compensation for disability. In Alberta, British Columbia, Manitoba and Nova Scotia, the new monthly rates for permanent total disability are, respectively, \$225, \$250, \$175 or earnings if less, and \$150; new weekly rates for temporary total disability for the same provinces are \$50 or earnings if less, \$39.95 or earnings if less, \$40, and \$47 or earnings if less, respectively.

British Columbia eliminated the three-day waiting period. Disability payment starts on the day following injury. Seven other provinces have a one-day waiting period, New Brunswick has three and Nova Scotia four.

Changes in dependants' allowances included increases in widows' monthly pensions in four provinces: British Columbia from \$145.85 to \$162.15 (including the increase of 4% caused

by the change in the consumer price index); Quebec from \$142.80 to \$147.08 (following the Quebec Pension Plan 3% adjustment tied to the consumer price index increase); Saskatchewan from \$127.50 to \$133.90; Manitoba from \$120 to \$150. Children's monthly allowances were raised by \$5 in Prince Edward Island (to \$30 for child with parent and \$40 for an orphan); Quebec to \$38.25 for child with parent, \$60.11 for an orphan; Manitoba by \$10 to \$60 (under 16), \$70 (over 16 at school) and orphans, \$70 and \$80; Saskatchewan from \$50 to \$52.50 for a child under 16 with parent and from \$65 to \$68.25 for an orphan under 16; British Columbia, child under 16 with parent from \$48.77 to \$52.79, orphan under 16 \$54.80 to \$59.39 — children over 16 at school receive corresponding increases. The maximum funeral allowance in British Columbia was increased from \$265 to \$380 and the allowance for burial or cremation charges from \$85 to \$120. The lump sum payment to a dependent widow or foster-mother in Canada is doubled to \$500. The increase in Manitoba is from \$500 to \$650. A Manitoba amendment makes the existing maximum burial allowance of \$300 applicable to cremation and the \$50 toward a burial plot applicable to an ash plot, urn or ash storage place.

An addition to the Saskatchewan Act provides for the appointment of a Workmen's Advocate, as an officer of the Department of Labour; he may assist workmen or their dependants in advancing compensation claims. British Columbia, Manitoba, Nova Scotia and Ontario have similar services. Saskatchewan repealed Part IV of the Act (accident prevention) now redundant in light of the comprehensive industrial safety program brought into being by the Occupational Health Act.

Newfoundland made special provision for payment of compensation in respect of certain St. Lawrence fluorspar miners. In Alberta, entitlement for persons in institutions (correctional, and mental hospitals) was substantially improved. British Columbia extended coverage to volunteer employment undertaken in the public interest (mountain rescue, etc.). Manitoba established Medical and Neurosis Review Panels and expanded provisions for accidents occurring outside the province.

8.2 The labour force

8.2.1 The labour force survey

Since 1946, reliable information for analysis of employment in Canada, at the national level and for the five major regions, has been provided through a labour force survey. Between November 1945 and November 1952, quarterly surveys were taken and since then the survey has been carried out on a monthly basis. The sample used in the survey has been designed to represent all persons in the population 14 years of age or over, residing in Canada, with the exception of residents of the Yukon Territory and the Northwest Territories, Indians living on reserves, inmates of institutions and members of the Armed Forces. Interviews are carried out in approximately 30,000 households chosen by area sampling methods across the country. In the survey, people are classified on the basis of their activity during the reference week, i.e., the week prior to the survey interview week.

The civilian labour force is composed of that portion of the civilian non-institutional population 14 years of age or over who, during the reference week, were employed or unemployed.

The employed include all persons who, during the reference week: did any work for pay or profit; did any work which contributed to the running of a farm or business operated by a related member of the household; or had a job, but were not at work, because of bad weather, illness, industrial dispute or vacation, or because they were taking time off for other reasons. People who had jobs but did not work during the reference week and who also looked for work are included in the unemployed as people without work and seeking work.

The unemployed are all those who, through the reference week: were without work and seeking work, i.e., did not work during the reference week and were looking for work, or would have been looking for work except that they were temporarily ill, were on indefinite or prolonged lay-off, or believed no suitable work was available in the community; were temporarily laid off for the full week, i.e., were waiting to be called back to a job from which they had been laid off for less than 30 days.

Those not in the labour force include all civilians 14 years of age or over (exclusive of the institutional population) who are not classified as employed or unemployed. This category includes people: going to school; keeping house; too old or otherwise unable to work; and

**Estimates of the civilian labour force and its main components, 1963-72
(figures not adjusted for seasonality)**

voluntarily idle or retired. Housewives, students and others who worked part-time are classified as employed or, if they looked for work, as unemployed.

Because they are based on a sample of households, estimates derived from the labour force survey are subject to sampling error. Somewhat different figures might be obtained if a complete census were taken and this difference is called the sampling error of the estimates. In the design and processing of the survey, extensive efforts are made to minimize the sampling error; in general, the percentage of error tends to decrease as the size of the estimate increases. A statistical measure of the sampling error is given in Statistics Canada monthly publication *The labour force* (Catalogue No. 71-001).

8.2.2 The labour force, 1963-72

As revealed in the accompanying chart and in Table 8.1, the period 1963-72 was one of rapid expansion as the actual labour force increased by 2.1 million persons or 31.8%. The number of women in the labour force increased by 57.9%, an advance that was greater, both absolutely and relatively, than the increase of 21.7% experienced by men. The total participation rate (the labour force as a percentage of the population) reached a record high level in 1972 of 56.5% compared with 53.8% in 1963.

In the decade under review, as in the entire postwar period, the male participation rate has been declining; in 1972 the rate was 76.2% compared with 78.5% in 1963 (as calculated from

Table 8.2). The second chart shows that the drop in the male participation rate between 1963 and 1972 was very pronounced among men in the 20-24 age group (88.7% to 84.0%) and in the 65 and over group (26.4% to 18.7%).

The accelerated entry of women into the labour force has more than compensated for the decline in male labour force participation; in 1972 the rate was 37.1% compared with 29.6% in 1963 (as calculated from Table 8.2). As the second chart illustrates the participation rate of women in the 14-19 and 65 and over age groups showed very little change over the period whereas the rate for women 20-64 years of age increased substantially.

The actual total number of persons employed in Canada rose from 6.4 million in 1963 to 8.3 million in 1972 (Table 8.1), an increase shared by all regions of the country (Table 8.3);

employment in the Atlantic region rose by 113,000 (21.6%), in Quebec by 463,000 (26.3%), in Ontario by 836,000 (35.1%), in the Prairie region by 234,000 (20.6%) and in British Columbia by 308,000 (53.9%).

Table 8.4 shows the changes over the decade in the distribution of actual employment by industry. The proportion of persons employed in the service-producing industries continued to increase; the numbers in the goods-producing industries indicated a corresponding decline. Transportation, trade, finance and service accounted for 63.3% of total employment in 1972 compared with 56.4% in 1963. Conversely, the goods-producing industries, comprising agriculture, primary industries, manufacturing and construction, dropped from 43.7% of total employment in 1963 to 36.7% in 1972. The most significant changes occurred in service where the share of total employment rose from 26.3% to 33.0% and in agriculture which recorded a drop from 10.2% to 5.8%. The growth in the service-producing industries was confirmed by the occupation data given in Table 8.5 which shows that the proportion of professional and technical employees rose from 10.6% to 14.2%, clerical rose from 13.4% to 15.4% and service and recreation increased from 11.1% to 12.1% during the period.

On an annual average basis, unemployment as a percentage of the labour force ranged between 3.6% in 1966 and 6.4% in 1971; it averaged 6.3% in 1972. Persons not in the labour force averaged 6.9 million in 1972 compared with 5.8 million in 1963, an increase of 18.5%.

8.3 Employment statistics

8.3.1 Employment, earnings and hours

Monthly records of employment have been collected from larger business establishments since 1921. The surveys currently conducted by Statistics Canada collect data on payrolls, per capita wages and salaries, hours of work, hourly and weekly wages and the number of salaried and wage-earning employees with their respective weekly salaries. Employment indexes are based on 1961 = 100; the data are compiled on the 1960 Standard Industrial Classification.

The survey covers all industries except agriculture, fishing and trapping, education and related services, and defence. Health and welfare services, religious organizations, public administration, and private households are also excluded.

The monthly employment statistics relate to the number of employees drawing pay in the last pay period in the month. Data are requested for all classes of employees except homeworkers and casual employees working less than one day in the pay period. Owners and firm members are also excluded. The respondents report the gross wages and salaries paid in the last pay period in the month, before deductions are made for income tax, unemployment insurance, etc. The reported payrolls represent gross remuneration for services rendered and paid absences in the period specified, including salaries, commissions, piece-work and time-work payments, and such items as shift premiums and regularly paid production, and incentive and cost-of-living bonuses. The statistics on hours relate to the regular and overtime hours worked by those wage-earners for whom records of hours are maintained, and also to hours credited to wage-earners absent on paid leave during the reported period. If the reported period exceeds one week, the payroll and hours data are reduced to weekly equivalents.

Employment. Table 8.6 indicates that, over the 1966-71 period, the industrial composite index of employment for Canada rose by 5.9%. Among the industry divisions showing gains over this period, service led with a 34.1% advance, followed by finance, insurance and real estate (21.3%), trade (15.0%), mining (7.4%) and transportation, communication and other utilities (6.5%). Declines occurred in forestry (25.1%), construction (10.4%) and manufacturing (1.5%) during the same period. Compared with 1970, the industrial composite index for 1971 was up 0.6%.

Annual average index numbers of employment for the years 1967-71 are shown by industrial division and group in Table 8.7; by province and for January 1971 to July 1972 in Table 8.8; and by metropolitan area and for January 1971 to July 1972 in Table 8.9.

Weekly earnings. Average weekly earnings have increased substantially in the years for which current payroll statistics have been collected, rising from \$23.44 in 1939 to \$102.76 in 1967 and \$137.65 in 1971. The upward movement gained momentum beginning in 1946 and average annual increases for the 1946-52 period were more than double those for the 1939-45 period. After 1952 the rate of increase, in percentage terms, fell somewhat, particularly during the 1959-62 period. In the recent period, gains have been 7.8% in 1970 and 8.5% in 1971. Annual index numbers of employment and average weekly earnings for 1969-71 are presented by

industry, province and urban area in Table 8.10. Table 8.11 shows annual average weekly earnings by industrial division for the years 1967-71 and monthly averages for 1971 and January-July 1972.

Hours and earnings of hourly rated wage-earners. The monthly survey of employment and payrolls covers statistics of hours of work and paid absence of those wage-earners for whom records of hours are maintained, together with the corresponding totals of gross wages paid. These wage-earners are mainly hourly rated production workers; information on hours is frequently not kept by employers for ancillary workers nor, in many industries and establishments, for any wage-earners. Salaried employees are excluded by definition from the series. As a result of these exclusions, data are available for fewer industries and workers than are covered in the employment and average weekly earnings statistics.

During the period 1966-71, average weekly hours declined slightly but average hourly and weekly wages rose substantially. For the most part, upward wage-rate revisions in all industries were responsible for the increases. Technological changes, which in many cases involve the employment of more highly skilled workers at the expense of those in the lower-paid occupations, also contributed to the advance of average hourly earnings. As indicated in Table 8.12, from 1966 to 1971 average hourly earnings rose by 69.6% in construction, by 55.4% in mining and by 45.8% in manufacturing. During the same period, average weekly hours declined by 7.1% in construction, by 4.3% in mining and by 2.7% in manufacturing. Comparing 1971 to 1970, average hourly earnings increased by 12.8% in construction, by 9.0% in manufacturing and 8.9% in mining; weekly hours dropped 1.5% in mining and remained unchanged in manufacturing and construction. Table 8.13 presents average weekly hours and hourly earnings in specified industries and selected urban areas for 1969-71.

8.3.2 Earnings and hours in retail trade

Until 1969 the annual survey of earnings and hours of male and female employees covered only the manufacturing industry. Data from the 1969 survey were published in the Statistics Canada report *Earnings and hours of work in manufacturing* (Catalogue No. 72-204). In line with a decision to survey a different industry division or its component every year, Statistics Canada collected data from retail trade establishments in 1970.

The retail trade survey. All large retail trade establishments (20 or more employees in any month of the year) and a sample of small establishments (fewer than 20 employees) were asked to supply data. The reference period was the last payweek in September 1970. The percentage distribution of full-time, part-time and casual and head office employees engaged in the retail trade in Canada and the provinces is presented in Table 8.14. Table 8.15 sets out average weekly earnings, average hourly earnings and average weekly hours for men and women by employee status in Canada and the provinces. More detailed information and separate data for large and small establishments are given in the report *Earnings and hours of work in Canada, retail trade industry* (Catalogue No. 72-601).

8.3.3 Estimates of labour income

Labour income, as shown in Table 8.16, is defined as the compensation paid to employees for services rendered comprising wages and salaries and supplementary labour income. It includes all such payments made to residents of Canada (Canadians employed by the federal government abroad are considered to be residents of Canada) except those made to the Armed Forces. Remuneration to the latter fits the definition of labour income but is excluded here as it is treated as a separate item in the national income accounts.

Wages and salaries include directors' fees, bonuses, commissions, taxable allowances and benefits. The gross remuneration concept has been adopted, and wages and salaries are measured before deductions for income tax, unemployment insurance, pension funds, etc. Supplementary labour income, which is defined as payments made by employers for the future benefit of employees, is composed of employers' contributions to employee welfare and pension funds including the Canada and Quebec Pension Plans, to the workmen's compensation funds, and to unemployment insurance.

Estimates of labour income based on the 1948 Standard Industrial Classification (SIC) have been published for 1926-69; those based on the 1960 SIC were published in 1969 for the period 1951-68 and then projected to the end of 1971. The entire series 1951-71 has been revised and carried back to 1947.

8.3.4 Employer labour costs

The labour costs survey, instituted in 1967 as a joint Statistics Canada - Canada Department of Labour project, is designed to measure the content of the total pay package. The results are of value in collective bargaining, in improving estimates of labour income and in developing better productivity measures. The survey also provides cost data for the various items studied in the Canada Department of Labour's survey of working conditions. In addition, all levels of government use the data in developing labour policy. The survey is conducted each year in one or more major industry divisions. At present a particular industry is surveyed every three or four years. Consequently, sufficient data are not yet available to determine trends over a period of time. When the results of the 1971 survey of the manufacturing industry have been tabulated, however, it will be possible to make comparisons between the years 1968 and 1971 for this industry.

The data already available permit comparisons of the total pay package components in those major industry divisions for which surveys have been conducted. In order to minimize the effects of general increases in salaries and wages, the labour cost estimates in Tables 8.17-8.20 are shown as percentages of payments made by the employer for regular work performed during normal working hours. Using the figures in Table 8.17, the actual cost of every \$100 in basic pay paid by an employer in manufacturing, on the average, for regular work in 1968, can be calculated to be \$128.14. Average weekly earnings in 1970 were \$132.75 in manufacturing, \$164.70 in mining, \$120.52 in finance and \$142.35 in transportation. The results of the labour costs survey show that the average amounts paid weekly for regular work in these industries in 1970 were \$113.61, \$134.62, \$108.15 and \$120.90, and that the corresponding total wage packages were \$145.58, \$181.56, \$131.28 and \$156.31, respectively.

The labour cost items studied reflect the differences in the nature of each industry and the occupations of those employed. The approximate ratios of salaried (office) employees to wage-earners (non-office) are: manufacturing 27:73; mining 30:70; finance 94:6; transportation 35:65. However, since the occupations of salaried employees are different from those of other employees, the relative costs for each group are compared separately in Table 8.18.

The labour costs show that additional costs for time worked are more significant for wage-earners than for salaried employees and that such costs are substantial in the mining industry and of minor consequence in finance, insurance and real estate. These costs include overtime (straight-time and premium pay), shift work and payments made to employees for work performed under special conditions. In the mining industry underground production bonuses for wage-earners account for 6.5% of basic pay. Overtime costs for wage-earners are slightly higher in mining (11.8%) than in manufacturing (10.9%). In the transportation industry overtime costs are slightly less than in manufacturing. On the other hand the additional cost for overtime in finance, insurance and real estate is only 2%. For salaried employees the overtime costs in all four industries are similarly low. One third of the total overtime costs represents premium pay.

Paid absence represents a significant additional cost to employers. The average cost for all employers expressed as a percentage of basic pay for regular work ranges from 9.5% in manufacturing to 11.8% in transportation. Table 8.19 illustrates the relative significance of the various components of paid absence for all employees, and for salaried employees and wage-earners separately. Employers usually provide sickness benefits through insurance plans rather than by continuing pay during illness. For salaried employees, on the other hand, the salary is usually continued. Many employers do not keep accurate records of absences for sickness and for personal leave; consequently the costs for these items are understated.

Miscellaneous payments to employees comprise termination pay, non-production bonuses, taxable benefits (such as board and lodging) and retroactive pay for a preceding year, etc. Expressed as percentages of basic pay for regular work they range from 1.0% in transportation to 2.3% in finance. For investment companies and security dealers, non-production bonuses are significant — 3.6% of basic pay.

Employer payments to employee welfare and benefit plans comprise payments required under federal and provincial statutes and payments made to other plans, either as the result of collective agreements or on a voluntary basis. Table 8.20 illustrates the relative significance of the various expenditures for all employees, and for salaried employees and for wage-earners separately. The figures for workmen's compensation reflect the relative differences in the exposure of employees to industrial injury; figures for private pension plans indicate the

numbers of employees who are employed in establishments which provide pensions in addition to the Canada and Quebec plans. The labour costs survey shows that for wage-earners in the mining industry there is a greater emphasis on direct payments to employees than on pensions. The figures for life and health insurance plans include additional costs for weekly indemnity plans to provide benefits to wage-earners who are absent through illness.

8.3.5 Wage rates, hours and working conditions

Statistics on occupational wage rates by industry and locality, with standard weekly hours of labour, are compiled by the Canada Department of Labour and published in the annual report *Wage rates, salaries and hours of labour*. The statistics are based on an annual survey covering some 38,000 establishments in most industries and apply to the last normal pay period preceding October 1. Average wage rates (excluding overtime) of time-workers and average straight-time earnings of piece-workers and other incentive workers for selected occupations are shown separately in the report but are combined to calculate the industry index numbers shown in Table 8.21. The indexes measure changes in wage rates for non-office employees below the rank of foreman. They do not, however, provide a basis for comparing the level of wages in one industry with that in another. The construction wage index rose from 195.5 in 1970 to 223.7 in 1971, that of mining from 159.4 to 169.9, service from 166.4 to 178.0 and local government from 183.2 to 200.2. Information on concepts and methods of developing these statistics is given in the annual report.

Table 8.22 presents average wage and salary data for 12 Canadian cities on October 1, 1971. Hourly and weekly wage rates are listed for 23 occupations in the construction and manufacturing industries; salaries are specified for men and for women engaged in several office occupations.

Table 8.23 gives summary data on working conditions of plant and office employees in manufacturing industries and in all industries for the years 1969-71. The percentages in this table denote the proportions that plant or office employees of establishments reporting specific items bear to the total number of all such employees in all establishments replying to the survey; they are not necessarily the proportions of employees actually covered by the various items. Further details and additional information are given in the annual report *Working conditions in Canadian industry*, compiled and published by the Canada Department of Labour and based on a survey at May 1 each year of some 38,000 reporting units.

8.4 Pension plans

Occupational pension plans in Canada have a long history. One of the earliest systematic programs was introduced by the federal government in 1870; the Grand Trunk Railway plan for clerical and indoor staff followed in 1874. Although the pension system did not grow significantly until the 1940s, the accelerated growth rate of that period continued through the 1950s and 1960s. A recent survey showed that over the past decade the number of plans increased by nearly 80%, from 9,000 in 1960 to well over 16,000 plans at the beginning of 1970; pension coverage was extended to an additional million workers, increasing participation from 1.8 million in 1960 to over 2.8 million persons at the beginning of 1970. With coverage at this level, nearly 40% of paid workers in Canada participated in a pension plan.

Pension plans were in operation in virtually all industrial sectors, but the degree of coverage varied widely from industry to industry. The most comprehensive coverage was in public administration and defence, where almost all of the 761,000 employees of all government levels, the Armed Forces and the RCMP participated in a plan. Two out of three paid workers in mining and over 40% in manufacturing were covered. In transportation and communication, with some of the oldest and largest plans in the country such as those in the railway, telephone and trucking companies, almost half of the paid workers (337,800 workers) had post-retirement protection. Of the employees working in finance, insurance and real estate about 45% were covered; approximately one in four workers in community, business and personal services — which includes hospitals, religious and welfare organizations and professional agencies, etc. — participated in occupational pension programs. Construction, with 107,400 plan members, had 23% of the workers covered; and trade, both retail and wholesale, with 142,500 participants, provided coverage for 13% of workers in the industry.

Of the more than 16,000 pension plans in Canada at the beginning of 1970, 11,000 — nearly 70% — were funded by insurance companies, but these accounted for less than 15% of the members or 398,700 out of 2.8 million. Plans with the largest coverage were those designed

Pension plans and members by funding agency

for government employees; employee contributions are paid into government consolidated revenue funds which are not held in the form of cash or invested securities. Although only 19 in number, these plans applied to a total of 607,800 public servants including those covered by the federal superannuation plan, the Armed Forces, the RCMP and public servants in five provinces.

Aside from these public service plans, the larger plans tended to use either personal or corporate trustees as funding agencies. Although only one quarter of all occupational plans were trusted, they covered more than 60% of the members — some 1.7 million out of the total of 2.8 million persons. The relationship of the various types of plans by funding agency may be seen in the accompanying chart.

Total contributions paid by and on behalf of the 2.8 million members in 1970 amounted to over \$1,700 million with more than \$1,000 million paid into trusted funds. With an annual cash inflow of this magnitude, trusted pension funds have become one of the largest single pools of money in the country, growing at a rate of 10% to 12% annually, with the book value of assets accumulated by these funds reaching a record total of \$12,461 million by the end of 1971. Because the growth of these funds is so rapid and the total accumulated so large, they are surveyed annually by Statistics Canada; the results are published in *Trusted pension plans, financial statistics* (Catalogue No. 74-201). A summary tabulation of the key financial data related to these funds is presented in Table 8.24.

The Canada and Quebec Pension Plans are discussed in Chapter 6.

Federal government annuities. Since 1908 the federal government has sold annuities and industrial pension plans under the Government Annuities Act. Decreased need for this type of service has resulted in the program's reduction. No salesmen have been employed since 1967 but annuities are still available under the Act to those who ask for them. They are now administered by the Unemployment Insurance Commission.

8.5 Unemployment insurance

Unemployment insurance has been part of Canada's social and economic life since the Unemployment Insurance Act was passed in 1940. Since that time various amendments have brought new categories of workers into the plan and contributions and benefit rates have been

raised periodically to meet changing economic conditions. However, until recently, the basic structure of the plan remained unaltered.

In 1968, when Parliament approved upward revisions of both contributions and benefit rates and broadened the scope of coverage, the Unemployment Insurance Commission was instructed to investigate the program and to recommend appropriate changes in philosophy and structure. The Unemployment Insurance Act, 1971, effective June 27, 1971, was the result of extensive study; its basic objectives were to provide assistance to cope with interrupted earnings resulting from unemployment, including unemployment from illness, and to co-operate with other agencies engaged in social development.

The 1971 Act extended coverage to all regular members of the labour force (effective January 2, 1972) for whom there exists an employer-employee relationship. The only non-insurable employees are those who earn less than 20% of the maximum weekly insurable earnings or less than 20 times the provincial hourly minimum wage, whichever is less. Coverage, contributions and benefit entitlement cease at age 70.

Employers and employees absorb the cost of initial benefits and administration; the employer rate is 1.4 times the employee rate. The government share is confined to the cost of extended benefits and the excess cost of initial benefits resulting from a national unemployment rate greater than 4%. There is no fund and employer and employee contributions are adjusted yearly. In 1972 the rate of employee contributions was 90 cents per \$100 of insurable earnings or a maximum of \$1.35 per week. The Department of National Revenue, Taxation collects the contributions. Persons formerly not contributing either because of their occupation or by virtue of being over the salary ceiling are paying a preferred rate for the first three years. For those who had been excluded because of their occupation, the preferred rate is portable. However, persons formerly excluded because of the salary ceiling pay the preferred rate only as long as they remain with the employer they were with on January 2, 1972.

Under the new program, the duration of benefit is not determined solely by how long a person has worked. A claimant can draw benefits for a maximum of 51 weeks depending on his employment history and prevailing economic conditions, providing he has contributed for at least eight weeks in the last 52 and he is available, capable and searching for work. Persons with 20 or more weeks of insured earnings (a "major labour force attachment") are eligible for a wider range of benefit that includes a pre-payment of three weeks of regular benefit for work-shortage lay-offs, benefit payments when the interruption in earnings is caused by illness or pregnancy, and three weeks retirement benefit for older workers.

Sickness benefit is available for a maximum of 15 weeks for persons with a major labour force attachment whose earnings are interrupted by illness, injury or quarantine (excluding workmen's compensation). If a person is taken ill while on regular claim, sickness benefit is available but the combined duration of benefits during the initial benefit period cannot exceed 15 weeks.

Maternity benefit is available for eight weeks before confinement, the week of confinement and six weeks after, to women who have had a major labour force attachment. They must also have been part of the labour force at least ten of the 20 weeks prior to the 30th week before the expected date of confinement.

Retirement benefit, available for three weeks, is paid in a lump sum to claimants with a major labour force attachment who are 65-70 years of age and who have signified they have left the labour force by applying for the Canada Pension Plan or the Quebec Pension Plan, and to persons over 70 years of age. Those over 70 must apply within 32 weeks of their 70th birthday as employment weeks are no longer earned after that time. The benefit is paid without a waiting period and without regard to earnings or availability.

The benefit rate for all claims will be two thirds of average insured earnings in the qualifying period to a maximum of \$100 per week and with a minimum of \$20 per week. For claimants with dependants and whose average qualifying earnings are equal to or less than one third of the maximum weekly insurable earnings, the benefit rate is 75%. During later stages of benefit all claimants with dependants draw benefit at 75% of qualifying earnings subject to the \$100 maximum. In 1973 and future years, the maximum insurable earnings and, therefore, the maximum benefit are subject to adjustment based on an index calculated from earnings of Canadian employees.

Income from employment in excess of 25% of the benefit rate is deducted. In the case of sickness and maternity, proceeds of wage-loss policies are deducted after the waiting period. All work-related income is deducted both during the waiting period and after the waiting period has been served.

The statistics in Table 8.25 summarize the Unemployment Insurance Commission's activities in the years 1968-72. Figures prior to July 1971 are affected by the Unemployment Insurance Act of 1955. It applied to all persons employed under a contract of service except: the Armed Forces; the permanent public service of the federal government; provincial government employees except where insured with the concurrence of the provincial government; certified permanent employees of municipal or public authorities; persons engaged in hunting and trapping, private domestic service, private-duty nursing, and teaching; workers on other than an hourly, daily or piece rate earning more than \$7,800 a year (effective June 30, 1968) unless they elected to continue as insured persons; employees in a charitable institution or in a non-profit hospital except where the institution or hospital agreed to insure certain groups or classes of persons with the Commission's concurrence. All persons paid by the hour, day, or at a piece rate (including a mileage rate) were insured regardless of amount of earnings.

An employee's contribution was determined by his weekly earnings; an equal contribution was required from the employer. The federal government contributed one fifth of the aggregate employer-employee contribution and defrayed administrative expenses. Contributions became payable on July 1, 1941 and benefits on January 27, 1942. By June 26, 1971 a total of \$7,789 million had been paid.

The benefit rates were calculated on the average weekly contributions for the last 30 weeks in the 104 weeks preceding the claim. To qualify for regular benefit, a claimant had to have had at least 30 weekly contributions in the last 104 weeks prior to claim, eight weekly contributions since the start of the last preceding regular benefit period or in the last year prior to claim, whichever was the shorter period, and 24 weekly contributions since the start of the last preceding benefit period, or in the year prior to the claim, whichever was the longer period.

The Act contained a special provision relaxing the regular contribution requirements somewhat during the five and a half months beginning with the first week of December each year. Under this provision, claimants drew "seasonal benefit" if they had at least 15 contribution weeks during the fiscal year, or, failing this, if they had terminated regular benefit since the previous mid-May.

To assess the impact of changing economic conditions on the insurance program, current operational data, such as claims filed and processed and payments made, are collected and published monthly by Statistics Canada. Current claims and payment data are useful for administrative purposes and are also a source of information to the public regarding financial and other aspects of the program. In addition to the monthly data on the operation of the Unemployment Insurance Act, detailed data on persons employed in insurable employment and benefit periods established and terminated are compiled annually and published in *Benefit periods established and terminated under the Unemployment Insurance Act* (Catalogue No. 73-201). Data on persons insured under the Act are obtained from a sample of persons in insurable employment each year. Persons on claim are included.

8.6 Employment injuries and workmen's compensation

Fatal employment injuries. Data on fatal employment injuries, compiled by the Canada Department of Labour, are collected from provincial workmen's compensation boards, the Canadian Transport Commission, other government authorities and press reports. In 1971, 1,060 industrial workers sustained fatal injuries. Collisions, derailments or wrecks caused 289 deaths; falls and slips, 178; being struck by an object, 222; being caught in, on or between objects or vehicles, etc., 85; inhalations, contact, absorptions, ingestions and industrial diseases, 123; contact with electric current, 45; conflagrations, temperature extremes and explosions, 60; and over-exertion, 18. The remaining 40 were the result of various miscellaneous accidents. Table 8.26 presents statistics on fatal employment injuries in 11 industries for the years 1969-71. Employment injuries, degree of disability and amount of compensation paid are reported by province for 1970 and 1971 in Table 8.27. In 1971, 818,780 injuries resulted in \$312.7 million in compensation compared with 811,644 injuries and \$304.5 million in compensation in 1970.

8.7 Organized labour

8.7.1 Union membership

At January 1, 1972, labour unions reported a total of 2.4 million members in Canada, an increase of 7.2% over 1971 (Table 8.28). Union membership comprised 34.4% of non-agricultural paid workers and 27.6% of the total civilian labour force in 1972. Membership, by type of union and affiliation, is presented in Table 8.29. Canadian Labour Congress (CLC) affiliates, with 1.7 million members in 1972, accounted for 72.8% of total union membership in Canada, compared with 74.8% in 1971. Of the total in CLC affiliates in 1972, 1.2 million members belonged to unions that were also affiliated with the American Federation of Labor and Congress of Industrial Organizations (AFL-CIO) in the United States; membership of unions affiliated with the CLC but not holding affiliation with the AFL-CIO totalled 529,559 or 22.3% of the total. Federations affiliated with the Quebec-based Confederation of National Trade Unions (CNTU) had 218,621 members or 9.2% of total union membership in Canada; the Canadian Council of Unions (CCU) represented 10,511 members or 0.5%; and the remaining 17.5% belonged to various unaffiliated international and national unions and independent local organizations.

International unions with headquarters in the United States accounted for 59.6% of the 1972 membership, compared with 62.0% in 1971; national and regional unions, which charter locals in Canada only, made up 37.7% (34.9% in 1971). Independent local organizations and local unions chartered by the CLC and the CNTU accounted for the remaining 2.7%.

In 1972, 20 unions reported membership of 30,000 or more. Ten unions reported 50,000 or more members, accounting for 39% of the total membership. The ten, listed with their affiliation, ranked as follows in 1972 (1971 rank in parentheses):

- 1 (1) United Steelworkers of America (AFL-CIO/CLC), 165,055
- 2 (2) Canadian Union of Public Employees (CLC), 157,919
- 3 (3) Public Service Alliance of Canada (CLC), 129,652
- 4 (4) International Union, United Automobile, Aerospace and Agricultural Implement Workers of America (CLC), 102,933
- 5 (5) United Brotherhood of Carpenters and Joiners of America (AFL-CIO/CLC), 74,362
- 6 (not included) Quebec Teachers' Corporation (Ind.), 70,000
- 7 (6) International Brotherhood of Teamsters, Chauffeurs, Warehousemen and Helpers of America (Ind.), 60,560
- 8 (8) Service Employees' National Federation, Inc. (CNTU), 56,603
- 9 (7) International Brotherhood of Electrical Workers (AFL-CIO/CLC), 56,026
- 10 (fewer than 50,000) International Woodworkers of America (AFL-CIO/CLC), 53,158.

8.7.2 Wages and collective agreements 1971

The Canada Department of Labour publishes wage settlements data for collective agreements on a quarterly basis. The agreements covered are limited to negotiating units of 500 or more employees in all industries, except construction. The base rate for a negotiating unit is defined as the lowest rate of pay, expressed in hourly terms, for the lowest paid classification used for qualified workers in the bargaining unit. In most cases, the base rate represents pay for an unskilled or semi-skilled classification of workers. However, this is not so in contracts covering only skilled and/or professional workers. The wage data, therefore, are not necessarily representative of the average increases enjoyed by the workers in the negotiating unit as a whole. Nevertheless, the data on numbers of agreements and workers refer to all occupational groups in the negotiating unit.

Wage rate data given in Tables 8.30 and 8.31 indicate that approximately 1.5 million workers were covered by 715 collective agreements at December 31, 1971. The average base rate rose 22.3 cents, or 8.1% during the 12-month period ended December 31, 1971, compared with an increase of 19.1 cents or 7.4% during the preceding 12-month period. On a year-over-year basis, the consumer price index rose by 5.0% during the 12-month period ended December 31, 1971, and by 1.5% during the preceding 12-month period. When the wage increases are deflated by the consumer price index increase, the average base rate increased, in real terms, 3.0% in 1971 and 5.8% in 1970.

Additional data are available from the Canada Department of Labour on wage settlements during quarterly periods, including number of agreements settled, number of employees covered and duration of contracts. The agreements covered are again limited to

negotiating units of 500 or more employees in all industries except construction. Details are not given here but, for 1971 as a whole, 333 contracts, affecting the wage rates of about 650,905 workers, were settled. On the average, the 333 settlements provided an annual percentage increase in base rate equal to 8.2% simple or 7.8% compound, over the term of the contracts. The comparable percentage for 1970 was 8.8% simple or 8.4% compound.

During 1971, settlements of one-year duration produced increases averaging 8.5%; those of two-year duration, 9.6% and 6.6% for the first and second years, respectively; and those of three-year duration, 9.4%, 6.8% and 5.6% for the first, second and third years of the contract. These increases compare with those of 1970 as follows: one-year agreements, average increases of 9.1%; two-year agreements, average increases of 10.0% and 7.4%; and three-year agreements, average increases of 10.2%, 7.0% and 4.4% for the first, second and third years, respectively, of the contract.

8.8 Strikes and lockouts

Statistical information on strikes and lockouts in Canada is compiled by the Economics and Research Branch of the Canada Department of Labour on the basis of reports from Canada Manpower Centres and provincial departments of labour. Table 8.32 presents a breakdown by industry of strikes and lockouts in 1971 involving five or more workers and continuing for ten or more man-days. The 547 work stoppages reported involved 239,631 workers and 2.9 million man-days.

The developments leading to work stoppages are often too complex to make it practicable to distinguish statistically between strikes on the one hand and lockouts on the other. However, a work stoppage that is clearly a lockout is not often encountered. The number of workers involved includes all workers reported on strike or locked out, whether or not they all belonged to the unions directly involved in the disputes leading to work stoppages. Workers indirectly affected, such as those laid off as a result of a work stoppage, are not included. Duration of strikes and lockouts in terms of man-days is calculated by multiplying the number of workers involved in each work stoppage by the number of working days the stoppage was in progress. The data on duration of work stoppages in man-days are provided to facilitate comparison of work stoppages in terms of a common denominator. They are not intended as a measure of the loss of productive time to the economy.

¹ Injuries requiring medical treatment but not causing disability for a sufficient period to qualify for compensation; the period varies among provinces.

² Includes, except where noted otherwise, payments to compensate loss of earnings, medical aid payments, cost of rehabilitation and hospitalization (not including capital expenditures) and pensions paid (not pensions awarded) for temporary and permanent disabilities; the Quebec compensation figure includes pensions awarded as well as pensions paid.

³ Distribution partly estimated.

Chapter 9

Scientific research

Early research in Canada was related mainly to the primary industries. Geological mapping and agricultural research were almost the only areas of scientific activity until the beginning of the present century. The National Research Council, which was set up in 1916 by the federal government to encourage and stimulate research in the universities and industry, established its own research laboratories in the late 1920s and early 1930s. During World War II, the National Research Council assumed responsibility for research and development activity for the Armed Services and for the development of atomic energy. After the War, in 1947, the Defence Research Board of the Department of National Defence was established to take over responsibility for military research and development and a Crown corporation, Atomic Energy of Canada Limited, was formed in 1952 to further the development of atomic energy in Canada. The National Research Council then reverted to its previous activities. Certain other Crown corporations such as Eldorado Nuclear Limited, Polymer Corporation Limited, and the Canadian National Railways also developed important research programs. The Medical Research Council was established in 1960 in association with the National Research Council.

Research councils were set up both before and after World War II in several provinces to improve utilization of provincial resources and industrial efficiency. The Ontario Research Foundation and B C Research, although established under provincial legislation, are self-governing institutions engaged in research and development on contract for manufacturers, departments of government and on their own account; they derive their revenue mainly from sponsored research. These councils and foundations have recently formed the Non-Profit Industrial Research Association of Canada (NIRAC).

Industrial research was slow to develop in Canada, although certain large industries, particularly the chemical and pulp and paper industries, have long histories of successful research and development. Since 1950, individual company programs, some aided by various government-sponsored incentive programs, have grown and diversified considerably. The degree of foreign ownership of manufacturing companies in Canada has undoubtedly had some influence on the development of industrial research, since Canadian subsidiaries of foreign companies had ready access to the research and development work of their parent companies. As a result, all but a few of these subsidiaries refrained from establishing their own laboratories. However, more recently, to meet the challenge of competition from other countries Canadian industry has increased its own scientific and technical investigations. The Sheridan Park Research Community, near Toronto, is an example of a recent concept for expanding and improving the efficiency of industrial research in Canada. A somewhat similar but more diffuse development took place earlier at Pointe Claire, Que. Industrial research centres of this type facilitate applied research and development activities for both scientists and engineers as they permit ready interchange of non-proprietary scientific and technical information and give them access to a wide variety of instrumentation, equipment and skills. The centres also provide an attractive environment for skilled personnel, which encourages trained scientists and engineers to stay in Canada.

A significant element in the training of scientists beyond the undergraduate level involves research and development activities undertaken in the universities as part of their program of graduate studies. These activities are related directly to the educational process and are important in the training of skilled personnel needed for the development of Canada's economy; they also create centres of basic research in Canada and serve as listening posts attuned to the progress of science and technology in other parts of the world.

9.1 Federal science policy

The ultimate authority for federal policy on science resides in the Cabinet. To exercise this authority a Cabinet committee known as the Committee of the Privy Council on Scientific and Industrial Research was established in the National Research Council Act. The Committee was chaired by the Minister designated in the National Research Council Act as responsible for that Council. The members were Ministers of other departments with significant science programs. The National Research Council for many years had the responsibility for advising

the Committee on science policy, complemented after 1949 by a panel of senior officials from the science-based departments and agencies. The Royal Commission on Government Organization pointed out, in 1963, that this apparatus had only infrequently tendered advice to the government.

In 1964, as a result of the recommendations of the Royal Commission on Government Organization, a Science Secretariat was created in the Privy Council Office. This Secretariat worked with the Cabinet Secretariat as part of the internal government structure to provide the most accurate and comprehensive background to Ministers at the time decisions on science policy were made. Its responsibilities included the monitoring of new program submissions, the initiation and formulation of new policies and program thrusts and the co-ordination of government participation in national and international science and technology activities. Later, in 1967, the Science Secretariat was granted the responsibility of nominating Counsellors (Scientific) for certain embassies and missions abroad, in close consultation with the Department of External Affairs.

In 1966, the federal government established the Science Council of Canada, a Crown corporation charged with independently assessing Canada's scientific and technological resources, requirements and potential and making recommendations thereon by publication of reports. The Science Council is concerned both with research and development and with the use of science and technology in the solution of Canada's social and economic problems. It draws its membership from industry, the universities and government, and its views are independent of those of the internal government structure.

The Council has published several reports based on commissioned studies from consultants on different areas of science and has also published its own reports making recommendations on these subjects. Some of the topics include upper atmosphere and space; the proposal for an intensive neutron generator; water resources research; university research and the federal government; scientific and technical information dissemination; earth and marine sciences; research in fisheries, wildlife, forestry resources and agriculture; a Canadian STOL (short take-off and landing) air transport system; communications network for computers; urban development; pollution problems; policies for basic biology and basic research; and policy issues in development of primary and secondary industries. In addition, the Council recommended that Canada focus its scientific and technological effort through the creation of "Major Programs" designed to help solve some of the country's social and economic problems. These programs include a space program for Canada, water resources management and development, transportation, urban development, computer applications and scientific and technological aid to developing areas of the world.

In 1967, a Special Senate Committee on Science Policy was formed to consider and report on the scientific policy of the federal government with the object of appraising its priorities, organization, budget and efficiency. The first published report (Vol. I, December 1970) describes what the Committee considered to be major deficiencies in the policy and the second (Vol. II, January 1972) contains specific recommendations on targets and strategies for the 1970s.

The Ministry of State for Science and Technology was established in 1971. The Minister formulates and develops policies for the optimum development and application of science and technology in Canada, co-ordinates science and technology within the federal government and fosters co-operation in science and technology with the provinces, with public and private organizations and with other nations. The Ministry has three branches: the International Branch which deals with international organizations, foreign governments and institutions; the Domestic Branch which handles relations with other departments and agencies, other levels of government, the universities, and other institutions; and the Policy Branch which assures the existence of planned, comprehensive and integrated federal policies for science and technology and advises on improving the efficiency and effectiveness of federal government activities in science and technology.

In 1972, the Minister of State for Science and Technology announced a new government "contracting-out" or "make-or-buy" policy, under which all new research and development (R&D) requirements of the federal government, except those falling within certain narrow criteria, will be contracted out to industry instead of being undertaken in government laboratories. The aim of this policy is to ensure that R&D results are translated more effectively into additional Canadian industrial capacity. Canadian industry undertakes too

little R&D relative to its needs and yet pays a much higher proportion of these costs than does industry in many other industrialized nations. Government expenditures on in-house research seem disproportionately large compared with the current levels of industrial research.

One of the first tasks facing the new Ministry was to take an overview of Canada's national resources in science and technology. During the first year, the survey of funds and manpower assigned by the federal government to scientific activities was extended to the social sciences and humanities. The results of these surveys are published in the annual "Green Book" under the title: *Scientific activities: federal government costs and expenditures*.

The Ministry of State for Science and Technology is also studying reporting mechanisms for research in progress in industry and universities and, as part of a national audit of research resources, is engaged in a survey of highly qualified manpower so as to promote a more comprehensive information base for improved policies and programs concerning this segment of the Canadian labour force. Productive consultations in these matters have been established between the Ministry, private industry, the universities and other levels of government.

9.2 Federal scientific research agencies

Research activities in the various federal government departments and agencies have expanded rapidly, at first because of the need for speeding up the production of raw materials, which were long the basis of Canada's export trade, and later because of increasing interest in the processing of raw materials, the necessity of meeting the needs of national defence and the developing consideration for many human and resource requirements. Expenditures of federal government agencies engaged in research activities are given in Table 9.6. Research activities of the Canada Department of Agriculture and the Canada Grains Commission are outlined in Chapter 11. Some of the activities carried on by the Department of National Health and Welfare and by the Medical Research Council are described briefly in Chapter 6.

9.2.1 The National Research Council

An outline of the historical development of the National Research Council of Canada appears in the *1969 Canada Year Book*, pp. 388-389. Most of NRC's nine divisions are located on a 400-acre site just east of Ottawa. A Prairie Regional Laboratory is located on the campus of the University of Saskatchewan in Saskatoon and an Atlantic Regional Laboratory on the campus of Dalhousie University in Halifax. Of the Council's 1971-72 appropriation of \$140.4 million, about \$67.5 million was used for scholarships and grants, \$48.7 million for the operation of the laboratories and \$8.4 million for the Industrial Research Assistance Program. In 1972 it had a staff of some 3,000 including about 750 holders of doctorate degrees. About 40 associate committees were active. In the year ended March 31, 1972, it supported some 4,600 university scientists and awarded 2,600 scholarships, bursaries and post-doctorate fellowships.

9.2.1.1 Organization

The National Research Council Act assigns to the Council the responsibility of undertaking, assisting or promoting scientific and industrial research in the following general areas: utilization of Canada's natural resources; improving technical methods and processes now used in Canadian industry and discovering new ones to provide for expansion or development of new industries; maintenance and improvement of the primary physical standards of measurement for Canada; determination of quality standards of material to be used in public works and standardization and certification of scientific and technical apparatus used in Canadian industry and government; and the fostering and carrying out of scientific and industrial research through operation of research laboratories, financial assistance for research activities in Canadian universities, financial assistance and promotion of research in industry, and operation of the National Science Library and the Technical Information Services.

The Council consists of four permanent officers, the President, Vice-President (Administration), and two Vice-Presidents (Scientific) and not more than 17 other members appointed by the Governor in Council. The Council, a body corporate required to meet at least three times a year, is responsible to a designated Minister of the Crown, who is a member of the Committee of the Privy Council on Scientific and Industrial Research. Except for the four permanent officers, Council members are appointed for a term of three years and serve without salary. They are drawn from the senior staffs of universities, industry and labour, in order to provide advice based on both scientific discipline and regional representation.

The President, who is the chief executive officer, is assisted by a number of Vice-Presidents and a Director General (Planning). The Director General (Planning), assisted by a small group of scientists, engineers and economists, is in charge of formulating long-range policies and plans, both for the research activities of NRC laboratories and for the support and encouragement of research in universities and industry; analyzing existing and alternative NRC projects and programs, taking into account both the scientific and economic aspects; and, in general, facilitating the task of identifying NRC priorities in terms of national needs.

One Vice-President (Scientific) is responsible for industrial research assistance and promotion, and another for the Council's awards program for support of university research. The laboratories and a number of administrative services of the Council come under the jurisdiction of a Vice-President (Laboratories).

Since April 1, 1970, federal research in astronomy has been consolidated under the National Research Council, which is now responsible for the operation of the Dominion Astrophysical Observatory, Victoria, BC, the Dominion Radio Astrophysical Observatory, Penticton, BC, the Time Service of Canada, the solar and meteor programs of the Dominion Observatory in Ottawa, and the Meteorite Observation and Recovery Project; the latter is a network of photographic stations with headquarters in Saskatoon, Sask.

The federal government has designated the National Research Council as the co-ordinating body for the further development of a national scientific and technical information system (STI), under the general direction of the National Librarian. The integrated national system, encompassing the natural sciences and engineering, will be decentralized and based on the existing resources and systems in industry, the universities and government.

9.2.1.2 Research activities

The NRC laboratories carry out long-term, applied and specific project research work, most of it industrially oriented although some programs are directed toward important national and regional problems and toward more basic and exploratory back-up research. A number of research projects are carried out on behalf of other government departments and agencies and a considerable amount of staff time is given to consulting on technical problems. In addition, some research projects are undertaken to solve a particular problem, or because of their potential for basically new technology. When successful, the desired result is the transfer of the new technology to productive channels in Canadian industry. New industries based on NRC-developed technology are beginning to be established, some located in large industrial centres and some in the Ottawa - Hull metropolitan area where they can maintain close contact with NRC laboratories and take advantage of the new technology generated by the laboratories of the Defence Research Board, Atomic Energy of Canada Limited, and the substantial research activities of several industrial firms in the area.

The Division of Biological Sciences was formed from the recent amalgamation of the former Division of Biology and the Biochemistry Laboratory. It provides greater flexibility and increased resources for achieving an integrated approach to significant biological problems. Problem orientation is facilitated by the formation of groups whose constitution may change as common interests develop or as new expertise is required. Such groups also include scientists in universities, industries and other governmental agencies.

Major research programs are under way in the study of: factors initiating or regulating proliferation of normal and malignant cells; the fate of persistent pollutants in flowing-water systems; the treatment of wastes from food-processing plants; the isolation and characterization of antigens from pathogenic organisms and the determination of structures of immunoglobulins as approaches leading to elucidation of the biochemical nature of the immune response in man; the application of spectroscopic techniques to the description of biological structures and mechanisms at the molecular level; patterns of nucleic acid-protein interactions; the production of useful metabolites from plant cells grown in submerged culture; radiation-induced lesions in organic molecules; and molecular structures of biochemical and other organic compounds as determined by X-ray crystallography.

The Division also houses the Environmental Secretariat serving the NRC Associate Committee on Scientific Criteria for Environmental Quality, whose function is to gather and evaluate the scientific knowledge of the effects of environmental contaminants. Documents listing scientific criteria derived from studies of cause-effect relations are in preparation.

Sub-committees are currently responsible for: pesticides and organohalogen compounds, heavy metals, air, water, biological, physical energy phenomena; and decisions on relevance. The Secretariat also operates, with the assistance of the National Science Library and the NRC Computation Centre, a scientific and technical information service on pollution research.

The Division of Building Research continues to reflect its triple role as an information, advisory and research agency serving the construction industry of Canada. In most years between 11,000 and 12,000 queries are answered from the Building Research Centre in Ottawa and the regional offices at Vancouver, Saskatoon, Toronto and Halifax. Some 700,000 copies of publications of all kinds were distributed on request during the past year, more than half of them accounted for by the monthly *Canadian building digest*, which is widely used in the teaching of building science and technology as well as by the industry generally.

The growth of the advisory role of the Division is evidenced by the increased number of committee memberships of all kinds held by the Division, which now totals 488. The annual revisions of the 1970 National Building Code, particularly in relation to fire safety provisions for high buildings, represents a substantial increase in this kind of activity for the officers who served as technical advisers to the various revision committees. Committee work has also begun on the preparation of the 1975 edition of the National Building Code and there has been substantial activity in relation to the preparation of a new edition of the National Fire Code to be issued in 1973. Assistance was given to the building standards work of the Canadian Standards Association, the Canadian Government Specifications Board and the American Society for Testing and Materials.

The Division provides opportunities for discussion, at the design stage, of the principles arising out of the steadily developing building science. Opportunities for communication of the results of research done in Canada and elsewhere are provided by building science seminars presented each year in Calgary and in Ottawa. Construction workshops, intended particularly for construction superintendents, were started in 1969 and are now held in nine centres across the country.

Growing interest in the economic development of northern Canada has brought an increasing demand for the experience and expertise of the Division's geotechnical section. Field studies are under way at present on the distribution of permafrost, uplift forces on structures during the freezing of the active layer in permafrost areas, on the forces of ice on structures and the use of insulation in road building. Work on high buildings is continued through projects on wind loads, seismic response of structures and air movement in buildings; the latter has assumed unusual importance because of its close relation to smoke movement. Special studies with the computer were carried out for various operational configurations of typical high buildings, supplemented by field trials in actual buildings incorporating new smoke control systems, as a contribution to information for further development of fire safety provisions in the National Building Code.

The Division of Chemistry covers a broad range of work from relatively short-term programs aimed at practical application in the natural resource and chemical industries, to long-term fundamental investigations in selected areas of scientific and technological importance. Active fields of research are analytical chemistry, chemical engineering, colloids, high polymers, high pressure physical chemistry, hydrocarbons, kinetics, photochemistry and catalysis, metallurgical chemistry, metallic corrosion and oxidation, textile chemistry, chemical spectroscopy, molecular structures, organic spectrochemistry, organic synthesis, thermochemistry, and theoretical studies.

Studies on membrane phenomena have suggested a number of applications for the concentration and separation of constituents of solutions by osmotic action. Considerable potential exists for reverse osmosis as a large-scale engineering process for saline water conversion and other concentration processes. Applications to problems of environmental quality appear to be of particular importance at the present time.

The spontaneous slow oxidation of organic molecules is often a limiting factor in the useful life of fuels, lubricants, foods and textiles. A long-term program of research on autoxidation has made substantial contributions to knowledge of the mechanisms by which these changes take place, and of how they can be accelerated or retarded. The application of this work to the aging process in animal life has aroused considerable interest from the medical profession.

Another laboratory has played a leading part in developing computerized methods for the automation of infrared spectroscopy. A file of some 30 computer programs put into modular form and distributed as a series of bulletins, card decks and tapes has attracted wide interest from industrial and university laboratories. This laboratory has also been intimately involved, in association with the CODATA Task Group for Computer Use, with the more general problems of computer-based techniques for the evaluation, storage and retrieval of numerical scientific data of various kinds. This work will have important applications in the pharmaceutical and petroleum industries.

The Division of Physics has three general areas of work: the improvement of Canada's social and economic climate by providing new data, concepts and designs to industry and government; the maintenance of physical standards of the highest quality; and the study of particular areas of physics in which the Division has a special competence. These activities are intermixed in sections devoted to acoustics, cosmic rays and high energy physics, electricity, heat, mechanics, metal physics optics, photogrammetry, plasma physics, spectroscopy, time, X-ray and nuclear radiation.

The Division maintains standards in the fields of mass, length, time, electricity, temperature radiation, photometry, colorimetry and acoustics. Besides providing these standards to Canadian industry and governments, the Division has a continuing program of comparisons of Canadian standards with those maintained by other industrial nations, thereby ensuring the acceptability of Canadian measurements in international trade. A third aspect of the standards work in the Division is a program to improve the primary standards so that future measurements will be more convenient and more precise.

During the past year the Division has been involved in a number of programs of significance to Canadian industry. A program of testing and calibrating high-quality industrial measuring devices has been continued and two seminars to acquaint industrial engineers with recent developments in measuring techniques have been held. An automatic colorimeter has been built and it appears that this instrument will be developed commercially. The instrument devised in previous years to measure automatically the depth, salinity and temperature of the ocean has been improved to give it a much faster response. A carbon dioxide laser designed for use in plasma studies has proved suitable for commercial production. A computer program designed to calculate the shielding of composite materials for various high energy radiations has been developed to aid in producing commercial shielding material. These and other commercial developments have their origin in the study and development of standards and in the studies of basic physics.

The long-range studies of a few selected areas of physics have been continued. During the past year significant new information on the nature of the charged particles captured by the earth's magnetic field has been obtained from experiments carried out with the ISIS-1 and ISIS-2 satellites. A number of the energy levels of light nuclei have been investigated with the linear electron accelerator and the positive ion accelerator. In the spectroscopy laboratory two-photon spectroscopy has been used for the first time to obtain accurate data on the vibrationally excited states of some simple molecules. The capabilities of the electrical standards laboratory have been extended by the construction of a very accurate low-frequency voltage divider. A new cesium time standard has been constructed which shows promise of considerably improving the accuracy of time measurements. The wavelengths and the frequencies of the emission lines from stabilized lasers have been measured and have yielded a more precise value for the velocity of light. Results on these and other similar programs are published in the scientific journals.

The Division of Mechanical Engineering. During 1971-72, a breakdown of the activities of this Division indicated the following: manufacturing technology 40%, transportation technology 40%, standards and standardization in the engineering industries 7%, computer applications 6%, engineering and biological control systems 4%, and medical and surgical instrumentation 3%.

Transportation work is about equally divided among land, sea and air developments. Land transportation activity is related mainly to the welding of rails for the Canadian railways, to apparatus for preventing the malfunctioning of railway switches in winter, to gas turbines and compressors for gas pipelines and to the examination of various aspects of container shipping, whether by rail or road. A substantial body of research is directed to special-purpose

ships and marine air-cushion vehicles and a large project is under way relating to navigational improvements of the St. Lawrence River in summer and winter.

Air transportation activities relate to the development and certification of new engines. In particular, research and novel investigations have been concentrated on engines appropriate to VTOL (vertical take-off and landing) aircraft.

Recent work in the manufacturing field is concerned with the application of two-phase heat transfer pipes to the maintenance of permafrost in areas of arctic construction, and with the de-icing of navigational buoys in waters off the Canadian east coast. Another project is the use of high-pressure water jets for cutting various kinds of materials.

Newsletters publicizing manufacturing processes not yet in general use in Canada are being widely distributed and have given rise to a most enthusiastic response through Canadian industry. Examples of the new technologies include the generation by grinding of precision case-hardened gear teeth, the generation of complicated shapes in a variety of materials by electrochemical machining, and the application of numerical control for much greater productivity of machine tools on single articles or small lots. In a number of instances, these technologies have proved of valuable consequence to Canadian industry.

In addition to the calibration of instruments, lubricating oils, fuels and various apparatus for Canadian industry, the various laboratories of the Division have been involved in the certification of the airworthiness of helicopters and various gas turbine engines in conditions of snow and sleet.

Because of the expense involved in the construction of prototype machinery and in arranging complicated experiments even with conventional machinery, the application of computers to the simulation of projected machinery performance has become very important. Typical examples of Division work pertain to the investigation of the parallel operation of compressors on gas pipelines; the transients resulting from changes in operation and the corresponding controls; systems analysis of certain control components and the general control features of a new nuclear power station, and of a hydro-electric power station (in collaboration with the University of the West Indies); dynamics of high-speed railway container cars; and new designs of reciprocating engines.

Work in progress in the development of new instrumentation for medical and surgical purposes ranges from the design of prototype instruments for extremely difficult operations on the spinal cord to final arrangements for production and marketing of a suturing instrument for blood vessels; the first activity is a collaborative one with the Montreal Neurological Institute and Queen's University, and the second is related to the licensing of a Montreal manufacturing firm.

Work continues on the industrial application of control theory — mechanical, electronic and fluidic, and the application of control system technique to animate beings. In particular, a considerable body of work has been accomplished in relation to the effects of microwaves on birds, and work relating to the possible supply of electrical control impulses to the muscular system of paralyzed people has begun. Conversely, progressively more detailed investigations are being made of biological control systems as possible models for better and more reliable engineering systems.

In order to establish an even closer liaison with Canadian firms and other organizations, the Division of Mechanical Engineering began in 1971 to set up some laboratories in Vancouver for this purpose.

The National Aeronautical Establishment conducts aeronautical research to meet the needs of military and civil aviation, working in co-operation with the Canadian aircraft industry. It studies problems of aerodynamics, aircraft structures and materials, and flight mechanics. It has the only development wind tunnel facilities in Canada and is equipped to handle most of the industrial or military aircraft developments of the foreseeable future. Aerodynamics research from low speeds up to about 17 times the speed of sound is carried out in the wind tunnels; considerable attention is being given at present to low-speed problems of vertical and short take-off aircraft. Other studies include work on the aerodynamic characteristics of high-thrust propellers, on wings with submerged fans and on wings immersed in powerful slip-streams. The research on structures and materials involves investigation of aircraft accidents, the theory of structures, fatigue and fracture, flight load statistics and aircraft hydraulics. The flight mechanics program covers research on flight safety and flying stability

and control, the development of a crash position indicator for locating crashed aircraft, atmospheric physics, and anti-submarine magnetometry.

A growing and highly diversified program of assistance to smaller industries is developing, the work relating mainly to product development, improvement or testing. Concerning aircraft utilization, efforts have been directed toward those areas of national activity where aerial methods might offer economies in cost or improvements in effectiveness, such as agricultural applications, forest fire fighting, aerial logging, high sensitivity magnetic surveys, precipitation physics, and studies of atmospheric turbulence.

The Radio and Electrical Engineering Division undertakes engineering projects of interest to Canadian industry and fundamental research in electrical science. The engineering program in the high-voltage field includes studies of corona loss and radio interference from direct-current transmission lines, and the development of current comparators for very accurate measurement of current and voltage ratios. An effort is being made to develop accurate tests of the lifetime of solid dielectrics used as insulation in high-voltage cables and components. The high-frequency laboratory is responsible for maintaining the national standards of RF power, voltage, impedance and attenuation and has recently participated in an international intercomparison of these standards. Assistance is given to industry in the design, production and evaluation of new equipment, and in the solution of such problems as the design of antennas and of microwave film and paper dryers and moisture sensors. Many devices are now in commercial production.

In the field of bio-medical engineering, new techniques in electrocardiography and echoencephalography have been developed, a study of cardiac stimulation thresholds is under way and instruments that will contribute toward the rehabilitation of handicapped persons have been produced. The Division has co-operated with members of the medical profession in the establishment of safety standards in the use of electronic equipment in hospitals for treatment and diagnosis.

Much of the research effort in the computer laboratories of the Division is concentrated on the problem of communication between man and computer. Computer graphics techniques have been adapted to provide a versatile tool for the film animator and for the composer of music. Problems arising in computer-aided learning systems are being investigated, and a touch-sensitive screen has been designed and patented, an extremely flexible input device that permits an untrained person to communicate effectively with a computer. Special data recording and analyzing systems have been developed to suit widely varying scientific programs.

Fundamental research is carried out in solid state physics, wave propagation, quantum electronics, and the behaviour of particles at ultra-high vacuum. Patents have been issued recently on a ruby laser which is self-Q-switched, and on a thermal transpiration vacuum pump.

The Astrophysics Branch of the Division is responsible for the operation of three major astronomical facilities, as well as a number of smaller observatories and observing stations throughout the country. Optical studies of stars and other celestial bodies are undertaken at the Dominion Astrophysical Observatory at Victoria, BC. The major instruments of this observatory are reflecting telescopes of 72-inch and 48-inch aperture equipped with powerful spectrographs. The Algonquin Radio Observatory in Ontario is equipped with a variety of instruments, the major one being a powerful 150-foot (46-meter) parabolic telescope. Facilities at the Dominion Radio Astrophysical Observatory in British Columbia include telescopes for low-frequency observations and for studies of neutral hydrogen in interstellar space.

Observations of radio solar emissions are made at both the Algonquin Radio Observatory and the Dominion Radio Astrophysical Observatory, and optical studies are carried out at the Ottawa River Solar Observatory near Ottawa. Other fields of research include the study of meteors and meteoric phenomena by optical and radar methods and from rockets and study of the physics of the upper atmosphere and the aurora.

The Space Research Facilities Branch develops and provides facilities to meet the needs of the upper atmosphere and space research programs of Canadian scientists in universities and government agencies. At present, its work is restricted primarily to the use of sounding rockets. The major launching site is the Churchill Research Range, a Canadian facility operated for the

benefit of both Canadian and foreign scientists. It has facilities for the launching of most types of sounding rockets and balloons carrying scientific experiments to investigate the earth's upper atmosphere. Associated ground-based instruments are available to study the aurora borealis by photographic and spectrophotometric methods. For occasional use, there is also a small launching facility at Resolute in the Northwest Territories, and a temporary facility was used at East Quoddy, NS, for studies of the solar eclipses of 1970 and 1972. An additional temporary site was used at Gillam, Man., for launchings in 1972 and 1973. The Branch also operates the Great Whale Geophysical Station at Poste-de-la-Baleine in Quebec, which records auroral phenomena for Canadian and United States scientists.

In the implementation of the sounding rocket program, the Branch is responsible for providing the vehicles and incorporating the scientific experiments into suitable payloads with associated telemetry and other devices; this work is carried out mainly by industrial contracts. The work of the Branch also includes the reduction of flight data to provide vehicle trajectory and attitude information to experimenters, and the provision, from the telemetered information recorded on magnetic tape, of data required by individual scientists in any form desired.

The Atlantic Regional Laboratory at Halifax in Nova Scotia is engaged in practical and fundamental studies in chemistry and biology related to the resources and industries of the Atlantic Provinces. Such studies include investigations of: the biochemistry and physiology of marine algae, fungi, bacteria, lichens, mosses and higher plants; the chemistry of naturally occurring organic compounds; and the physical chemistry of inorganic compounds at high temperatures. A major objective is to develop varieties of seaweeds with enhanced commercial value and to investigate the growth and cultivation of seaweeds and other marine algae. Surveys are being made to reveal new sources of seaweeds. An applied project on toxic microfungi in pastures is being carried out in collaboration with the Canada Department of Agriculture at Nappan, NS. Fundamental studies on inorganic reactions at high temperatures may be of value to the steel and glass-making industries, and research in organic reactions, which includes work on methods of synthesis, may also eventually have industrial value. Some of the work in biochemistry and physiology is related to medicinally important compounds such as antibiotics and drugs that affect mental processes.

The Prairie Regional Laboratory at Saskatoon, Sask., develops wider uses for crops grown on the Prairies. The laboratory program is carried out by five sections: physiology and biochemistry of fungi, physiology and biochemistry of bacteria, plant biochemistry, chemistry of natural products, and engineering and process development. Research is carried out on the properties and reactions of plant components, and on the biological, chemical and engineering processes for turning them into other compounds. The development of oil-seed crops as alternative crops has received considerable attention.

For some time, studies have been carried out on major plant constituents such as carbohydrates, protein, starch, lignin and fibres. An example of this work is the definition of the chemical structure of several polysaccharides found in cereal grains and important in baking, milling and fermentation technology. Attention is also being given to minor plant constituents, such as phenols, flavonoids and terpenes, which are known to have fungicidal and germicidal properties and facilities have been set up for the systematic study of extractives from local plants and shrubs.

Developments attracting commercial interest are: the production of feed supplements by direct use of micro-organisms, and specific essential amino acids such as lysine; poly-hydroxy alcohols such as glycerol and arabitol; hydroxy fatty acids; and the possibilities of producing specific glyceride types using the enzyme systems of micro-organisms. The laboratory works in co-operation with the Canada Department of Agriculture to help maintain Canada's position as the world's leading exporter of rapeseed, used to produce cooking oils, dressings and oil for use in margarine and shortening. A group working in the field of mycology is concerned with the production of new chemicals, antibiotics, alkaloids and amino acids.

9.2.1.3 University research support

From its inception, the National Research Council has encouraged and supported research in Canadian universities. A system of postgraduate scholarships and postdoctorate fellowships gives assistance to students, Canadians and landed immigrants who have shown promise of research ability. The awards are: Postdoctorate Fellowships; Industrial

Postdoctorate Fellowships; Postgraduate Scholarships; 1967 Science Scholarships; Postgraduate Scholarships in Science Librarianship and Documentation. Awards are for advanced studies and/or research in science and engineering and are competitive, with academic excellence being the main criterion in the selection of successful candidates. In addition, the Council in 1973 is to introduce an Industrial Cooperative Fellowship program.

Postdoctorate Fellowships and Industrial Postdoctorate Fellowships are awarded to candidates who have recently completed or who are about to complete their requirements for a doctorate degree. The purpose of the two programs is to enable those who have received a doctorate degree to undertake, prior to becoming permanently employed, postdoctoral research for up to two years after receiving their degree. Postdoctorate Fellowships are tenable, in Canada, in Canadian universities and with Provincial Research Councils and in universities and other institutions abroad; Industrial Postdoctorate Fellowships are tenable in industrial organizations in Canada. Postgraduate Scholarships are awarded for tenure in Canada and a successful candidate may elect to carry out his program at the Canadian university of his choice; however, where facilities for a PhD program are limited or lacking in Canada, the candidate may receive special permission to hold his scholarships at a university abroad.

The 1967 Science Scholarships, introduced to celebrate the centennial of Canadian Confederation and the 50th anniversary of NRC, are intended to encourage young men and women of outstanding intellectual promise to pursue postgraduate studies and research leading to doctorate degrees, as well as to stimulate exchanges of students between different cultural and geographical regions in Canada. Scholars must select for graduate studies a university in Canada other than the one from which their first degree was obtained.

Postgraduate Scholarships in Science Librarianship and Documentation, introduced in 1967, are intended to encourage graduates with a degree in science or engineering to become science librarians, documentalists or science information specialists in an effort to meet the demand by universities, research laboratories, industrial firms and related organizations for qualified persons in this field.

Industrial Cooperative Fellowships, to be introduced in 1973, are intended to provide opportunities for further training and experience for engineers and scientists currently in industry, and to improve communication at the university/industry interface by putting experienced industrial scientists and engineers in essentially university staff positions. The Fellowship is not intended to support a candidate where the sole purpose is to obtain a higher degree. It is expected that the work the Fellow undertakes will provide further training and research experience consistent with the interests and objectives of his company since the company will be sharing with the National Research Council in the cost of any award. It is also anticipated that in some cases the recipient of the Fellowship will bring to a university or laboratory valuable knowledge and experience that he may be prepared to share by conducting seminars and/or teaching.

9.2.1.4 Assistance to industry

The application of science to industry has been a major concern of NRC since its founding. There is a constant flow of personnel and information between NRC laboratories and those of industry, and roughly 70% of the Council's own effort involves applied research intended for industrial use. Contract research on specific projects and a variety of testing and standardization work are undertaken. Inventions from NRC laboratories are carried through the patent stage, then made available for manufacture through Canadian Patents and Development Limited, a subsidiary of NRC.

In an effort to improve the co-ordination of the various agencies of government concerned with administration of industrial assistance programs, a study group has been formed of the major participants, including the Department of Industry, Trade and Commerce, the Defence Research Board, the Department of Finance, the Treasury Board and NRC. This group is active in its efforts to devise improved incentive programs. Staff members of NRC have organized meetings with representatives of Canadian research management, and from these there is emerging a much clearer picture of the problems of industrial research and development in Canada.

Since 1962, the Industrial Research Assistance Program, administered by NRC, has provided almost \$67 million in funds in support of R&D projects involving a corresponding

expenditure by industry of over \$90 million. The number of projects funded during the year ended March 31, 1973 was 230, tenable in 157 companies. For the first time since the inception of the program in 1962 all provinces have benefited from the program since, as a result of continuing encouragement to companies, projects are being supported in Newfoundland and Prince Edward Island. The highest level of research activity continues to be in the chemical, electrical, pharmaceutical, and paper and allied products industries.

With the time interval between research discoveries and the appearance of an improved product in the marketplace measured in decades, it is too early to forecast the effect of the program on the Canadian economy. The rate of growth of the IRAP in the early stages was governed by a shortage of senior scientists and research engineers, time needed to build laboratories and the share of company funds available to match government assistance. Recent reports from participating companies reveal a considerable change with a substantial increase in staff, in the purchase of sophisticated research instruments and in capital expenditures which have more than doubled since the program started.

The number of small companies applying for IRAP assistance is growing rapidly and there are a number of case histories showing that small companies can do highly successful research and development with the appropriate incentives. A close working relationship has been effected between the industry group, some 90 university professors in a consulting capacity, and approximately 130 scientists as advisers or liaison officers from government laboratories. This new link between industry, university and government is improving communication and providing a feedback of industrial activities and requirements into the universities and government laboratories.

9.2.1.5 Technical information

The Technical Information Service (TIS) was established in 1945 to help small secondary manufacturing industries keep pace with advances in research and technology. TIS today maintains direct contact with industry through a system of field offices and provides, without cost, information and advice on technological matters.

The Industrial Engineering Section has nine industrial engineers in the field and three in Ottawa, helping small companies to resolve their operating problems on a do-it-yourself basis. This is done through information, guidance and assistance in the analysis of work situations, improvements in production processes and facilities, and implementation of systems by which management can operate and control production processes for optimum results.

The Technological Developments Section further facilitates the flow of technical information to Canadian industry. An experimental program is carried out with the co-operation of some 3,000 companies each of which has provided TIS with a listing of its areas of industrial interest; these are matched by computer with the information items held by the Technical Developments Section and selected lists are issued to each company.

Engineers in the TIS field offices visit or contact thousands of small companies in every part of Canada and answer well over 10,000 inquiries a year. Problems requiring information in greater depth are referred to the Ottawa staff who draw upon experience with previous inquiries, the National Science Library, experts in government departments and industry, and foreign information services for suitable information which is forwarded to the inquirer, sometimes accompanied by suggested solutions to their problems.

9.2.1.6 The National Science Library

Plans for developing a central scientific library were proposed as early as 1924 by the Honorary Advisory Council for Scientific and Industrial Research, established in 1916, now the National Research Council of Canada. The Library grew slowly until 1928 when temporary research laboratories were established near the present Sussex Drive building which was opened in 1932. Since then it has been developed to parallel the growth and expansion of the laboratories and the national interests and activities of the Council with the result that in 1953, under an agreement with the more recently established National Library, the National Research Council Library formally assumed responsibility for national library services in the fields of science and technology, a responsibility confirmed by Act of Parliament in 1966. In 1967, the President of the Association of Canadian Medical Colleges recommended to the government that responsibility for national services in the medical and health sciences be assigned to the National Science Library.

The National Science Library now serves as the focal point of a national scientific and technical information network. Through co-operative measures with both national and

international information agencies, its activities are designed to provide the Canadian scientific and industrial communities with direct and immediate access to resources and services not available locally. Increasing use is being made of computer and related electronic data processing equipment to organize, retrieve and expedite the dissemination of information. One such service is a selective dissemination of information (SDI) system available on a regular (weekly or bi-weekly) subscription basis to Canadian scientists and engineers. The Library's collection, which is doubling in size every ten years, constitutes one of the world's outstanding collections in its field. Most of this material, including journals and other serials, books, pamphlets and technical and research reports (many in microform), is housed in the main Library with smaller and more specialized collections in eight branch libraries.

The resources of the Library are made available by means of an extensive inter-library loan and photocopying service. This service also identifies references to obscure publications and, if necessary, attempts to locate holdings elsewhere in Canada or abroad. For purposes of current awareness, the Library issues twice a month its *Recent additions to the library*. The *Union list of scientific serials in Canadian libraries*, prepared by the Library with the co-operation of other libraries in Canada, records the title, holdings and location of approximately 40,000 scientific and technical journals received by over 230 libraries in Canada. The data for this publication are stored on magnetic tape and updated regularly for computer print-out as new editions are required.

Librarians trained in science or engineering and subject specialists provide a reference and research service to meet Canadian needs for information. To reply to many inquiries, a literature search must be carried out and a list of relevant references prepared. Other requests for information may be answered from the staff's own knowledge or with advice from the scientific and technical personnel of the Council and other government departments and agencies.

The *Canadian index of scientific translations*, a card index to the location in Canada or elsewhere of translations of articles written in foreign languages, is maintained by the Library. Translations of scientific articles prepared by the Library's Translations Section are listed and made available in Canada and abroad. A complete English translation of the Russian journal *Problemy severa (Problems of the north)* is also prepared by this Section. The National Science Library publishes the *Directory of Canadian scientific and technical periodicals*, *Conference proceedings in the health sciences*, *Scientific and technical societies of Canada*, *Scientific policy, research and development in Canada* (a bibliography), and other publications related to its own activities.

9.2.1.7 Associate committees

NRC's associate committees provide an important instrument for studying, co-ordinating and promoting research on problems of national significance. The members of these committees are experts in the different aspects and disciplines related to the problem and are drawn from university, industry and government laboratories. The committee studying a particular problem collects and collates the necessary information, delineates research problems, co-ordinates research and may initiate new research necessary to the solution of the problems. Each committee has defined objectives and when these are accomplished the committee is disbanded. Currently, more than 40 associate committees are operating in such diverse fields as aerodynamics, bird hazards to aircraft, protective coatings research, plasma physics, and soil and snow mechanics. Some associate committees also function as national committees for an international scientific union.

An Associate Committee on Scientific Criteria for Environmental Quality has been established by the Council to collate and publish an integrated set of scientific requirements on which an evaluation of the quality of the environment can be based. The criteria will be designed to assist those at the federal, provincial and municipal levels who are responsible for formulating and enforcing environmental quality standards. A more detailed account of the work of the Committee will be found in the description of the Division of Biological Sciences in preceding pages.

9.2.1.8 International relations

NRC maintains a scientific liaison office in London, England, for the exchange of information and maintains exchange programs with the Soviet Academy of Sciences (USSR);

France, as part of the Cultural Exchange Agreement and specifically with the Centre National de la Recherche Scientifique; the Conselho Nacional de Pesquisas de Brazil; and the Czechoslovak Academy of Sciences (Czechoslovakia). Under these programs arrangements are made to send Canadian scientists on short- and long-term visits to each of the above countries and to receive scientists from those countries for similar visits in Canada.

In co-operation with the Canadian International Development Agency, NRC has initiated a program of CIDA - NRC Research Associateships for scientists from developing countries. Awards under this program provide an opportunity for promising scientists to spend annually in Canada up to three months during a three-year period. During these visits the scientists will be associated with Canadian scientists who will guide and assist them with their research programs. Candidates under this program must be eligible for assistance under one of the programs of the Canadian International Development Agency.

In addition, NRC supports Canadian membership in organizations such as the International Council of Scientific Unions, helps to finance scientific congresses in Canada, and aids Canada's participation in world scientific meetings.

9.2.2 Atomic Energy of Canada Limited

At the present time an appreciable proportion of the world's estimated total fossil-fuel resources has been consumed by a comparatively small segment of the world's population. This rate of consumption is increasing, the increase reflecting not only population growth but also increasing per capita energy demands. The active exploitation of energy available from nuclear fission provides the only known, practicable means of reconciling the world's energy demand (present and projected) with available resources.

Canada's atomic energy program has maintained a significant position in the world's nuclear power community comparable with the major nuclear powers. Atomic Energy of Canada Limited has, in the development of the heavy-water-moderated power reactor concept, provided a nuclear power system whose simplicity of design and flexibility of fuelling requirements offer the prospect of abundant, low-cost electrical energy for the foreseeable future on a world-wide basis.

The unique position of Canadian CANDU (CANada-Deuterium-Uranium) power reactors in the world's nuclear power systems is the Canadian use of heavy water (deuterium oxide) as a moderator for slowing, or "moderating", the neutrons from nuclear fission to maintain the fission chain reaction. The high neutron economy obtained by using this moderator and employing neutron-transparent core materials (zirconium alloys) means that natural uranium may be used as fuel. The use of natural uranium in the CANDU system is incidental to the basic concept of neutron economy but its use at the moment has certain economical and political advantages and serves as a useful engineering design discipline. The user of a natural-uranium fuelled reactor system is not dependent on one of the very limited number of countries providing uranium enrichment services and is able, for a comparatively modest capital outlay, to establish a domestic fuel fabrication industry. This, together with the inherent simplicity of the technology of the CANDU reactor, makes it a particularly relevant system to those countries wishing to establish an indigenous nuclear industry.

The bulk of Canada's power reactor operating experience so far has come from three generating stations operating in Ontario. These — NPD (the Nuclear Power Demonstration station at Rolphoton), Douglas Point and Pickering — all use reactors cooled by pressurized heavy water (PHW), and in view of the Pickering station's performance it may be said that the CANDU-PHW option has been proved commercially viable. In Quebec, the operational record of the 250-MW prototypical Gentilly reactor has given good grounds for the belief that the second member of the CANDU "family", using ordinary water as coolant, will be equally successful. The incentive for developing the boiling light-water-cooled (BLW) CANDU is economic. By eliminating the heavy-water coolant and the hardware associated with a secondary coolant circuit, substantial capital cost savings may be realized and construction time (a major cost factor) may be reduced.

Development of a third coolant option in the CANDU series, organic liquid, offers the potential of higher operating temperatures (in the region of 400°C) and much easier maintenance. At the Whiteshell Nuclear Research Establishment an organic-cooled experimental reactor (WR-1) has been operating reliably for several years. Compared to water-cooled CANDUs, reactors cooled with organic liquid (a mixture of light oils) can

operate at higher temperatures and more moderate pressures. An additional (and unexpected) bonus is the fact that the organic coolant deposits minimal amounts of radio-active corrosion products on piping surfaces, so that most of the primary heat-transport circuit is readily accessible for maintenance. In the case of the WR-1 reactor, activity fields around the primary circuit are trivial, even when the reactor is operating at full power.

Power reactor development. The year 1972 saw the proving of the CANDU-PHW concept as a reliable and economically attractive energy source. All major technical questions affecting their viability, e.g., heavy-water losses, on-power fuelling and fuelling costs, have been satisfactorily answered. Equally important is the fact that Canadian industry has been proved capable of bringing such a complex project to fruition ahead of schedule. The reliability of the Pickering reactors in a non-routine situation was also convincingly demonstrated in 1972 when, after a lengthy shut-down due to a strike by Ontario Hydro employees, the three reactors were re-started and brought to full power without incident and with remarkable rapidity.

Pickering generation station is, however, merely the starting point for Ontario Hydro's nuclear-intensive energy program. Bruce, a four-unit, 3,000-MW PHW installation is scheduled for completion by 1979. Subsequent nuclear generating stations will continue to use the PHW system, probably until the late 1980s. A similar pattern, although starting later, is expected with Hydro-Quebec whose operating experience with the AECL-owned Gentilly BLW reactor is to be augmented by the construction of a 600-MW PHW installation on the same site.

With this in mind, it is apparent that a large part of AECL's power reactor development activities will be oriented to the support and enhancement of the PHW reactor. Evidence of this development will be seen in the Bruce generating station, whose design incorporates many evolutionary, rather than revolutionary, design changes. These are especially aimed at increasing the reliability of the conventional (as opposed to nuclear) components, such as pumps, seals and valves. Improvement in the thermal efficiency of the PHW will be realized by operating the heavy-water coolant in the near-nucleate boiling mode. In the period 1969-71 the Nuclear Power Demonstration reactor at Rolphton, Ont. was operated in this manner to provide data on hydrodynamic stability, reactor control, and corrosion effects of the boiling heavy-water coolant. This experimental work provides a good example of how AECL's research and development work is aimed "at a moving target" since results from the NPD investigations had particular relevance to the CANDU-BLW Gentilly project.

The major thrust in AECL's power reactor development is toward realizing capital cost reductions without compromising the basic CANDU concept of neutron economy. The BLW reactor, with its reduced heavy-water inventory, single-stage cooling and reduced construction time, represents a move in this direction. Further exploration of this concept could include use of plutonium-enriched fuel which, in a BLW, would enable considerably more power to be extracted per core unit volume. Not only would this offer substantial cost savings but it would provide an opportunity to utilize the plutonium contained in spent PHW fuel, thus effectively "stretching" Canadian uranium resources. A longer-term possibility is the employment of the thorium fuel cycle in conjunction with an organic coolant, and plutonium enrichment, or possibly a supply of neutrons from an external source.

Fuel development work at AECL is now aimed at first improving the existing uranium dioxide fuel to further increase its ability to withstand sudden reactor power fluctuations, and then at developing new, higher density fuels such as uranium silicide and alloys.

Heavy-water production remains, in many ways, the keystone to the growth of Canada's nuclear power program. The shut-down of the Douglas Point reactor in the summer of 1972, for decontamination and other maintenance work, together with the shut-down of NRU, one of three high-power experimental reactors, for a vessel change released sufficient heavy water to allow Pickering III to start up. This is indicative of the present short supply of this material. With the rehabilitation of Glace Bay (a 400-ton-per-year plant), the maturation of the Port Hawkesbury plant (400 tons per year) and the coming into service of the 800-ton-per-year Bruce plant (supplied with steam from the Douglas Point generating station) in 1973, the short-term heavy-water-supply problem should be relieved. If the hoped-for expansion of nuclear power in Canada (especially in Ontario) is to be realized, then further heavy-water production facilities should be committed in the near future. AECL regards heavy-water

production as the key to the commercial success of the CANDU system and is devoting considerable effort to rehabilitation of the Glace Bay plant, together with intensive development of the established generating station heavy-water production process, and then to active investigation of and experimentation with other possible extraction processes.

Fundamental research has always been, and must remain, the basis of AECL's development, and the major special tools for this research are the three high-power experimental reactors WR-1, NRU and NRX. Not only do these reactors have provision in their cores for the irradiation of materials over extended periods of time, but special isolated fuel channels, or loops, are provided for the in-reactor testing of different fuels and coolants — such testing being fundamental to prosecution of the Canadian power reactor program. Horizontal holes through the reactor shielding allow intense neutron beams to be directed to various experimental research facilities.

All three large reactors have undergone considerable change in the course of their operating history. NRX, with two calandria changes, entered its 25th year in 1972 and remains a vital research facility rather than a treasured museum-piece. At Whiteshell the organic-cooled WR-1 has undergone two major modifications. The original stainless steel fuel channels have been replaced with channels of Ozhennite-0.5, a zirconium alloy of greater neutron "transparency" which will permit a reduction in fuel enrichment and a 50% increase in neutron flux. In addition, the reactor core has been increased in size from 37 fuel sites to 54, the 17 new fuel channels being part of a third independent coolant circuit. A fourth in-reactor loop has also been installed.

It had been planned for some time to shut the NRU reactor down and carry out a vessel change, and in 1972 an opportunity to do this presented itself. By the end of the year the old reactor vessel had been successfully removed and preparations for installing the new one were well advanced. A most significant result of the NRU vessel change will be the addition of two further in-reactor loop positions.

Complementary to in-reactor experimentation, out-of-reactor loop tests can simulate the environment of a power reactor, apart from the radiation field. One of the major pieces of out-of-reactor test equipment is the freon loop, a large test rig designed specifically for investigation of the boiling water heat transfer and flow characteristics. With three full-sized test sections, the loop will provide realistic test facilities for any type of CANDU fuel configuration presently envisaged. The use of freon, with its low boiling point, as a modelling fluid to simulate water provides a considerable saving in both construction and power costs.

A further major research tool at the Chalk River Nuclear Laboratories (CRNL) in Ontario is the "MP" tandem Van de Graaff accelerator. Among its many uses are precise studies of the structure and excited states of heavy atomic nuclei. Data acquisition and analysis equipment associated with the accelerator is on-line to powerful data processing systems. In 1972 this machine was up-rated from 10 to 13 million volts and a new magnetic spectrometer was installed in one target position. These modifications will provide higher particle energies and considerably increase the machine's research potential.

AECL does not conduct an active research program on the question of fusion, but does maintain a watching brief on work being done in other laboratories. There is good reason to suppose that were a fusion reaction successfully maintained and safely contained, it might prove more profitable to use such a reaction as a neutron source for a CANDU fission system rather than as a power source on its own.

In the field of technical information the introduction of mechanized systems is progressing. The main CRNL Library, Canada's national repository of nuclear literature, has successfully introduced computer control of book circulation, periodical renewal and budgeting. Experimental operation of a computerized current awareness service has started, initially to serve AECL staff, but later to be extended on a national basis.

With the coming to maturity of the CANDU-PHW power reactor system an increasing load of development work is being handled by both CRNL and WNRE. Despite this, a high quality of active research has been maintained, as has collaboration with other laboratories in universities and research institutes in Canada and abroad.

Recently there has been growing public concern about pollution of the environment, even extrapolated to the development of nuclear power and the handling of radio-active wastes. For many years AECL has maintained an environmental research branch at the Chalk River Nuclear Laboratories and has been able to study the problems of radio-active waste

management in a secluded and special area. This area is on bedrock which forms a shallow basin with only one water outlet — a small stream — which is monitored to ensure that levels of radio-activity remain below those permissible for drinking water. Should such levels be approached the flow can be held back to increase the dilution, or alternatively, the whole stream can be processed.

Highly radio-active fission product residues including strontium-90 and cesium-137 were formed into glass blocks which were buried in this area in 1959; since that time the surrounding groundwater has been monitored. Activity levels have been found to be extremely low, giving good grounds for confidence in this method of managing certain high-level wastes. There is no reason to suppose that operation of CANDU power reactors will impose any significant radiological burden on the environment. Management of high-level solid wastes from power reactors is simplified by the fact that over a 35-year operating life a 1,000-MW(e) nuclear generating station will produce only as much spent fuel as could be safely contained in an Olympic-size swimming pool.

In order to obtain independent monitoring the Department of National Health and Welfare, many years ago, undertook responsibility for the radio-active monitoring of public water supplies, discharges into rivers, and the atmosphere.

Commercial activities. AECL's Commercial Products Division is responsible for marketing radio-isotopes produced at Chalk River. Radio-isotopes are increasingly being used in medicine (for diagnosis and therapy), agriculture, industry and pollution control, a trend which is expected to continue.

Well established as a world leader in the design of cancer therapy equipment, Commercial Products' most recent activities include the introduction of a new cobalt therapy machine known as the Brachytron, which can remotely locate up to three small cobalt-60 sources in body cavities for internal radiation therapy, and the development of a computerized treatment planning and therapy system. AECL Commercial Products is also embarking on a program to produce and market accelerators for cancer therapy.

Another activity of growing importance is the Commercial Products' trace-element analysis service. Employing neutron activation analysis, the service can identify elements and their quantities in submitted samples. This has particular application in the determination, for example, of various contaminants in food sources and human tissue.

Relations with other organizations. A strong feature of the Canadian organization for atomic energy is that the regulatory body, the Atomic Energy Control Board (AECB), is separate from the chief executive agency (AECL). This, however, does not preclude close working relations. The President of AECL is, ex officio, a member of the Control Board and AECL staff are members of several AECB advisory committees.

AECL shares with the Department of Industry, Trade and Commerce a desire to increase the participation of Canadian industry in the developing nuclear market and AECL's many overseas interests involve relationships with the Department of External Affairs and the Export Development Corporation.

While AECL does not make grants to universities, research contracts are negotiated in many cases where the university has the necessary facilities and expertise. Some 20 Canadian universities undertake such work for AECL. However, the close relations that have been built up with universities are mainly the result of personal contacts. During the summer, many graduates and undergraduates of Canadian universities work at AECL establishments. A number of professors also use AECL facilities for research projects, a service which, due to the demand, is now available through the year under the aegis (at CRNL) of the Experiments Advisory Committee, a joint universities and CRNL committee. It is also noteworthy that some 60 former AECL staff now hold staff positions at Canadian universities.

AECL has encouraged and fostered Canadian industrial participation in many aspects of its program, by the award of research and development contracts, and the employment of professional and consulting services. Development contracts have contributed materially in qualifying Canadian companies to supply services, materials and equipment to the exacting standards required in the nuclear industry. As a result, two Canadian companies are now established as qualified and competitive suppliers of nuclear fuels. In other cases, qualification results from trial orders, supported by the provision of a prototype or samples, specifications and assistance from the laboratories and technical staff.

International relations. The study of nuclear energy has prompted more free exchange of information and co-operation between countries of differing political systems than any other field of endeavour. Canada is no exception to this rule. Many irradiations in the NRX, NRU and WR-1 reactors have been made for several countries, at their expense or on a shared-cost basis.

In exchange for information on the Canadian power reactor program, the US has carried out an agreed research program in support of AECL's work. Technical meetings and the exchange of reports have maintained contact between the UK steam generating heavy-water power reactor project and the Canadian program. Italian relations have been strengthened and put on a more formal basis with the maintenance at CRNL of a full-time Italian Liaison Office.

Close relationships also exist between AECL and the Department of Atomic Energy in India, the first Canadian-designed research reactor to be built outside Canada being built near Bombay in a co-operative program, partly supported by the Colombo Plan. AECL also designed India's first heavy-water nuclear power station, the Rajasthan Atomic Power Project, now nearing completion under a co-operative program.

Additionally, formal arrangements for information exchange have been established with Australia, France, the Federal Republic of Germany, Japan, Romania, Spain, Sweden, Switzerland and the Soviet Union.

AECL is represented on numerous international organizations and committees. Its Senior Vice-President (Science) represents Canada on the United Nations Scientific Advisory Committee to the Secretary General, and is also a member of the International Atomic Energy Agency (IAEA) Scientific Advisory Committee. Canada is a member of the Board of Governors of the IAEA and participates in advisory panels, conferences and symposia arranged by this organization, and also plays an important part in the development of the International Nuclear Information System (INIS), which is providing a worldwide nuclear information service. Canada is a major participant in the United Nations Scientific Committee on the Effects of Atomic Radiation (UNSCEAR) as well as other ad hoc United Nations committees. AECL also contributes to the activities of the International Nuclear Data Committee, the OECD Nuclear Energy Agency and the International Council of Scientific Unions.

To sum up, since Rutherford's exploratory work forty years ago, nuclear science, and the exploitation of nuclear energy, have both advanced at a very rapid rate. A vivid illustration of the rate of progress is provided by the recent history of the CANDU-PHW power reactor. From a 25-MW(e) demonstration plant, becoming critical in 1962 (NPD), there was an eightfold increase to the 200-MW(e) Douglas Point reactor, critical in 1965. A 250% increase in capacity was represented by each of Pickering's 500-MW(e) units (first unit critical 1971). A further 50% increase will be seen when the first of the Bruce station's 750-MW(e) reactors starts up in 1976.

9.2.3 Department of Energy, Mines and Resources

The objective of the Department of Energy, Mines and Resources is to ensure the full and effective use of Canada's energy and mineral resources for the benefit of all Canadians. Its mandate encompasses the development, co-ordination and implementation of federal policy governing energy and mineral resources and the carrying out of research to obtain the scientific, technical and economic information basic to the making of such policy. The Department comprises three sectors – energy development, mineral development, and science and technology.

9.2.3.1 Energy development

The tremendous growth in energy consumption in the world's industrialized nations and the increasing awareness that Canada's energy resources constitute a precious and not inexhaustible patrimony whose use must be carefully planned and regulated have given new weight and responsibility to the Department's Energy Development Sector. Its functions are reviewed in greater detail in Chapters 12 and 13.

9.2.3.2 Mineral development

The Mineral Resources Branch identifies and evaluates trends affecting Canada's mineral industry by studying the entire mineral industry from geologist to user – exploration and development, processing, transportation, marketing and consumption. The information

provides a basis for decisions to be taken within the Department and contributes to the development of resource policies. It carries out the administration of the Emergency Gold Mining Assistance Act; advises and participates in the programs of several other federal departments and task forces; represents the Department on several national and international committees; and co-ordinates the Department's foreign aid activities with the Canadian International Development Agency.

9.2.3.3 Science and technology

The Science and Technology Sector carries out a broad range of scientific research pertaining to the earth sciences — geodesy, geology, geophysics, mineralogy, metallurgy and geography. The Sector comprises, in addition to the Surveys and Mapping Branch whose functions are described in Chapter 1, the Geological Survey of Canada, the Mines Branch, the Earth Physics Branch, the Polar Continental Shelf Project and the Canada Centre for Remote Sensing.

The Geological Survey of Canada provides a systematic knowledge of the geology, mineral and fuel resources of the country and assists in the effective use and conservation of resources, and in the management and preservation of man's environment throughout Canada. Continuing research projects, especially those involving a major component of laboratory work, have given rise to the establishment of teams with unique capabilities in such areas as mass-spectroscopy and isotope dating, including: the development of instrumentation and continuing refinement of techniques in support of field research; geochemistry, especially projects in which new field techniques have been developed; biogeochemistry, involving geology, geochemistry and botany; clay mineralogy; and various geophysical projects, especially in the development of remote sensing devices. Research tools and systems that have been developed include: high resolution aeromagnetic survey systems; ground gamma-ray spectrometry; development of airborne gamma-ray spectrometry for the search for radio-active minerals; practical methods of field geochemistry for prospecting; field methods for detection of Radon-222 in streams and sediments to outline uranium-bearing areas; and a method of tracing mineral trains in glacial deposits back to source as an aid to prospecting. In addition, the Geological Survey has led the world in rapid reconnaissance geological mapping using helicopters and other aircraft, especially in the field techniques developed and applied to the mapping of the arctic regions.

The Mines Branch is an interdisciplinary applied science institution engaged in research in non-renewable mineral resources and metals. Its facilities include a Mining Research Centre which carries out research on such problems as stability of underground and open-pit mines, methods of rock breakage, problems of environmental engineering and methods of obtaining maximum performance in mining operations. The Branch's general objective is to provide leadership in ensuring a sound scientific base for new technology and in stimulating the application of advanced technology to the extraction, processing and use of minerals and fuels in Canada and in the improvement of metal products. Specifically, it aims to improve the efficiency of the mining, processing and use of mineral resources and of metals and alloys; to improve the recovery of low-grade mineral resources and to minimize waste; to recognize problems in industry and undertake research, or give advice, on methods of solving these problems; to predict shortages and substitutions from technological market trends and to undertake research on mineral resources of potential value. It plans its activities in terms of its mission-oriented research, conducting basic research only when purely scientific data are required for technological purposes. As a corollary, the Branch has had to build up some facilities to support its specialized activities, such as facilities for the carbonization of coal, the study of corrosion, and for pilot-scale mineral processing and foundry investigations.

The Earth Physics Branch investigates the magnetic, gravity and seismic characteristics of the earth as a whole and of the Canadian land mass in particular. It utilizes the results of its research and of the research done elsewhere to obtain new and more detailed knowledge of the Canadian land mass, leading to improved magnetic and gravity charts, knowledge of earthquake hazards and detection of underground nuclear explosions. Some major programs are: studies on the properties and characteristics of the earth's crust and deep interior; study of the magnetic field in Canada and its variations, both to aid navigation and to investigate the ancient history of the earth; and study of variations in the gravitational field in Canada, relating this to the shape of the earth and to problems in accurate surveying. The Branch is

concerned with the recovery of meteorites and investigation of meteorite craters. Branch scientists conducted the world's first systematic search for ancient meteorite craters using air photographs, maps and other information. Sixteen impact sites have been identified in Canada and a greater number of possible sites are under investigation. These investigations have been distinguished by the broad approach taken to the problems of crater identification and analysis; gravity, magnetic, seismic, resistivity, structural, topographic and petrographic methods have all been employed; even more important has been the pioneering use of continuous diamond drilling to investigate the deep zones of a number of craters.

The knowledge so gained has application to the nature, origin and abundance of meteorites and to the history of the more stable parts of the earth's crust. The analysis of field and laboratory observations, coupled with pertinent experiments, has led to a better understanding of the dynamic properties of the earth's crust and the nature of its response to high-energy shock pulses. These results have application to the field of rock mechanics and to the contemplated use of nuclear explosions for large excavations and are of significance to the mining and oil and gas industries because large impact structures have sometimes formed or controlled the distribution of deposits of economic importance.

The Polar Continental Shelf Project has been undertaken to increase the scientific and technical knowledge about the arctic regions of Canada. It provides the means for integrating or co-ordinating arctic investigations and, by developing specialized knowledge and experience in technology, logistics, communication and human problems and making such facilities and knowledge available to responsible organizations, it promotes effective scientific and technical work in the arctic regions. The project works directly with other branches of the Department in planning and carrying out an integrated program of arctic research and survey; it conducts independent investigations to obtain information of basic importance about arctic phenomena, resources or conditions; and it co-operates with other government departments and agencies and with universities to provide expertise and facilities for arctic studies. Major programs, most of which are undertaken in co-operation with other departmental branches or agencies, include: aeromagnetic surveys of arctic regions and preparation of aeromagnetic maps; geodetic and topographic surveys of arctic regions to improve surveying techniques and knowledge of glaciology; investigation of marine geology of the arctic continental shelf and continental slope; investigation of terrestrial geology of arctic regions; hydrographic survey of the arctic continental shelf and slope; and oceanographic survey of arctic waters near the continent.

The Canada Centre for Remote Sensing is the newest branch of the Department of Energy, Mines and Resources. It has been set up to supervise and co-ordinate airborne and satellite remote sensing in Canada, and to carry out or encourage research in remote-sensing technology and interpretation.

The sensors now being used are mainly of two types: photographic cameras using a variety of special films, including infra-red; and line scanners that operate somewhat like television cameras and are mounted in an orbiting satellite. The Centre has at its disposal a number of aircraft to respond to requests for remote-sensing surveys from federal, provincial and private research agencies. It has also entered into a contract with the US National Aeronautics and Space Administration (NASA) to receive imagery of Canadian territory from NASA satellites. The first of these satellites, the Earth Resources Technology Satellite A (ERTS-A) designed especially to scan the surface of the earth and to catalogue its resources, was launched in July 1972. It orbits the earth at an altitude of approximately 500 miles, the orbits shifting to follow the sun.

Remote-sensing imagery is capable of giving a quick and — in the case of satellites — constantly updated overview of forest cover, snow cover and snow melting, movement of sea ice, the condition of ocean water, urbanization, land use, etc. It is a novel and exciting tool for those charged with planning the orderly development and conservation of Canada's resources.

9.2.4 Department of the Environment

9.2.4.1 Meteorological research

The federal agency responsible for meteorological research is the Atmospheric Environment Service (AES) of the Department of the Environment. Capital, operating and maintenance funds for research and development allotted to the Atmospheric Environment

Service for the year ended March 31, 1972, amounted to \$4.5 million. In addition, assistance in the form of grants and contracts in the field of meteorology carried out by Canadian universities amounted to about \$386,000.

The AES provides consultation, advice and information on the effects of weather and climate on a wide range of activities such as water resource management, agriculture, forestry, transportation, communications, industry, construction, air pollution control, aviation, tourism and recreation. In the field of hydrometeorology, which involves that portion of the hydrologic cycle which is affected by or which affects the atmosphere, the main processes of interest are precipitation, energy exchange and evaporation. Specialized studies are carried out on storms, meteorology of lakes and rivers and the water balance of the natural environment. Many of these are of a co-operative, interdisciplinary and interagency nature, some in connection with international programs and others in relation to flood and water supply forecasting.

Climatic analyses and studies in support of natural resources, arctic exploration and development, industry and commerce are conducted within the Service itself, by the assignment of personnel to other agencies, through co-operative programs, or through contracts. Arctic studies are made in support of oil and mineral exploration, pipeline construction, the selection of airports, town and mining sites, the design and operation of communication systems, transportation and operations in severe cold weather. Topoclimatological studies, using mobile and stationary sensors, are a basis for optimum land use in fruit production and town planning; engineering studies are undertaken in support of the construction industry and analyses are used in the National Building Code; and an ice accretion climatology is being developed to aid in the design of support towers.

Atmospheric processes research. Progress continues in theoretical meteorology by using the basic dynamic and thermodynamic equations in conjunction with large computers. Topics studied include: energetics of atmospheric circulations; modes of development in extratropical and tropical cyclones; influence of moisture exchanges on the synoptic circulation; and new physical and mathematical modes for studying and forecasting circulation patterns.

Studies of atmospheric motions ranging from about one mile horizontally up to about 100 miles (mesometeorology) are of great importance in local weather variability and are of basic importance for air pollution control.

The study of radiation, both solar and terrestrial, is of fundamental importance in respect to atmospheric energetics and information on radiation is of great value in many human activities. Research programs include: basic properties of radiation instrumentation, their design and standardization by international comparisons; development and use of radiometersondes for measuring radiational variation with height; and use of radiation data for a number of applications including atmospheric dynamics, agriculture, and construction.

The atmosphere above 30 km contains only 1% of the earth's atmosphere but the nature and extent of the interaction, both physical and dynamic, between this region and the underlying atmosphere require examination. The coupling mechanisms, through circulation and radiative processes, require study both from the viewpoint of downward energy propagation and climatic modification, and upward in relation to radio communication and flight through these regions. Studies include: the measurement of ozone in the atmosphere both from ground-base systems and by Nimbus 4 Ozone Experiment Data Evaluation. Nimbus 4 was successfully launched from Vandenberg Air Force Base on April 18, 1970. The satellite has a near-circular orbit at 1,100 km above the earth and is close to the local noon/local midnight meridian. Backscattered ultraviolet instrumentation is used in the evaluation. High-level ozone profiles for the region above the main ozone maximum have been evaluated for over 30 orbits.

Air quality research includes the development of an air pollution climatology for Canada, experimental plume-rise studies, urban and regional multiple source dispersion, wind-tunnel modelling, visibility trends in Canada and the development of air quality indices, studies of the effects of pollution on climate and studies of urban meteorology.

Important additions to the research programs in air quality are environmental impact studies for existing and proposed industrial sites. In the past year, these special short-term investigations have taken on great importance as a result of the growing public concern about

the environmental impact of both industry and modification to established facilities and as a result of the growing realization of the importance of meteorological factors in determining the effects of pollutant emissions on air quality.

Within the next year, as part of a commitment to the World Meteorological Organization's global monitoring network, three baseline stations at remote Arctic and oceanic sites and seven regional stations at rural locations will be established. In addition, a national network of urban reference stations, one for each large city, will be established over the next five years. The observational program will include not only the standard meteorological elements but also precision measurements of the concentrations of various particulate and gaseous pollutants, the chemical constituents of precipitation, turbidity and the downward components of radiation. Special air pollution research networks will also be operated from time to time for testing physical and numerical models. In this connection, the co-operation of the provinces will be sought to exchange suitable data.

Environmental research. Research studies on cloud and precipitation mechanisms were continued, partly to increase knowledge in this field but also with the objective of discovering possible modification techniques. These studies have strong implications for economic benefits as more and more successful modification techniques are discovered. Experimental seeding of hailstorms in Alberta in 1972 produced encouraging results, as did local experiments on the dispersal of fog such as that which hampers transportation at airports and on inland marine routes. Basic studies on the mechanisms of cloud formation and precipitation development were also continued with an eye to possible rainfall augmentation techniques.

Field and laboratory studies continued on means of identifying, locating and tracking lightning-producing storms, the aim being to assist forestry interests to combat forest fires and to assist other agencies where precautionary measures would result in significant savings either to persons or property.

Work continued on increasing the effectiveness of radar to observe and differentiate storm details. Equipment and techniques were developed and improved to calibrate, record and archive weather radar observations for effective use as a "radar rain-gauge". Other studies involved the measurement of atmospheric electricity variables and studies of their correlation with meteorologic phenomena, also laser/radar applications to meteorology.

Theoretical study was made of the effect of atmospheric parameters on the occurrence and extent of the sonic boom generated by aircraft flying supersonically.

Work continued on improving the performance of the lysimeter. A successfully modified soil moisture control system was designed and installed. In order to operate the lysimeter in severe winter conditions, a device was developed and installed to prevent ice formation and snow accumulation in the gap between the lysimeter and the retaining wall.

In a co-operative research program with the Ontario Ministry of Agriculture and Food in connection with frost protection of vineyards, frequency and strength of inversions at three sites in the Niagara Peninsula were continuously measured. Experiments were also conducted to bring down warm air from aloft using helicopters to stir the air at a height of about 75-100 ft.

Work was carried out on evaporation from sunken and non-sunken class A pans to determine their energy components in order to arrive at the most important meteorological parameters for reduction of data to open water evaporation.

Hydrometeorological studies contribute to greater efficiency in the design and operation of dams, sewer systems and other water control structures; improved forecasting of lake and river levels, floods, water supply and irrigation requirements; and more efficient design and operation of hydro-electric power developments. Work continued on improving estimates of the distributions of precipitation, evapotranspiration and snowpack water content using surface instrumentation and remote sensing techniques. Progress was made in the development of mathematical models of water balances and energy balances involving meteorological data and hydrological applications. Efforts were directed to studying the effects of man on the hydrologic cycle and the resultant spectrum of water-related environmental management problems. Much of this work was carried out in support of federal-provincial projects and the International Hydrological Decade.

Studies of atmospheric processes in the earth's atmosphere boundary layer, that layer of the atmosphere from the surface up to a few thousand feet, are of importance in such fields as agriculture, forestry, oceanography, weather forecasting, etc. Study topics include: wind and

turbulence in the surface boundary layer; turbulent fluxes of momentum, heat and moisture; radiation and surface energy balance; and temperature and humidity microstructure. A major program was carried out to investigate the interaction of the atmosphere and Lake Ontario by measuring the evaporation and heat flux from or onto the lake and the wind drag on the lake surface. A highly instrumented jet aircraft was used to extend the level of observations up to 1,000 ft and over the whole lake. The results will be useful in incorporating the lake effects into forecasting models.

Meteorological services research. A rapidly expanding program of applied research, including some more fundamental aspects where necessary, is grouped together in the Meteorological Services Research Branch in order to provide support for the expansion and improvement of forecast services of the AES.

Centralized aspects of the forecast system, carried out at the Canadian Meteorological Centre, receive support through a program of research and development in numerical-dynamical weather prediction using a very large computer to simulate atmospheric behaviour. Improvements are being made based on advances in dynamic, computational and occasionally quasi-empirical techniques. International effort in this area is being strongly influenced by the Canadian program.

Research and development to improve and automate the regional and local operations of the forecasting system is being intensively pursued. New forecasting operations are being investigated including systems for predicting air pollution potential, ice in navigable waters, forest fire hazards, avalanches and wind-waves.

Observational systems and data problems relating to improvement of the forecast system are continually being studied and evaluated. The work in this area touches on many basic questions that the Service must answer which means that a high degree of co-ordinated effort is necessary. For example, in one area, remote sensing satellite meteorology will have a very strong impact on the whole question of the quality and make-up of the atmospheric data base which, in turn, is related directly to the efficiency and effectiveness of the forecasting system.

Instrument research and development. The gathering of quantitative atmospheric data is a basic requirement for knowledge of the past and present, and prediction of the future weather. To accomplish this, instrumental measurements of the atmospheric variables are taken at 2,500 representative surface locations in Canada and the vertical structure of the atmosphere is probed to 100,000 ft at a network of 36 stations by means of rawinsonde balloon ascents. In all, approximately 50 different types of instruments and instrument systems are used in operational measurements and a number of other types in specialized investigations.

Continuing research and development is directed at improving existing measurements as well as in testing instruments to meet new needs. Some of the more noticeable areas where effort is expended are described here.

A family of automatic weather stations designed for great flexibility of application has been developed. These stations are now being used in a network of teletype reporting stations, in mountain stations for use in hydrological measurements, for reporting coastal winds by radio and on an experiment as recording stations for remote operation in the deep Arctic. The Earth Resources Technology satellite (ERTS) is also being used experimentally as a communication channel for one of these stations.

The development of ancillary processing equipment for use with weather radar is well advanced. The equipment under test involves a system controlled by a mini-computer which accepts the input from a C-Band weather radar. This radar is programmed to scan a horizontal volume of air of approximately 10,000 sq miles in area centred on the station to a depth of 30,000 ft above the surface. The computer sorts out the returns from the radar and issues a quantitative cross-sectional map of precipitation intensity of four levels from 5,000 to 30,000 ft superimposed on an area map. This information may be transmitted in approximately real time by telephone circuits for the information of a variety of users such as weather forecasters, hydrologists, etc.

Experimental prototypes of an acoustic radar have been successfully tested and further development toward operational equipment is started. This equipment, termed SODAR, transmits a pulse of acoustic energy upward and the sonic back-scatter from small temperature irregularities in the atmosphere is detected and graphically depicted. The ultimate use which is visualized for this equipment is to provide a continuous indication of the stability structure of

the lower levels of the atmosphere for possible use in the control and prediction of atmospheric pollution accumulation.

An investigation has been carried out to determine the practicality of a single ended back-scatter fog detector as a general visibility device for use at automatic weather stations. The purpose of the investigation is to determine the validity of the manufacturer's calibration and claims with respect to different obscuration.

The handling of large quantities of data quickly is only feasible by means of computers. Investigations are under way to determine the techniques involved in moving the sensor outputs directly and automatically into the computer, thus eliminating the present intermediate handling and processing steps which may involve manual operations or complex analogue devices.

9.2.4.2 Forestry research

The responsibility of the federal government for forestry research and development is defined and established by the Forestry Development and Research Act (1966) and the Department of the Environment Act (1970).

The primary federal organization concerned with forestry is the Canadian Forestry Service of the Department of the Environment. Within the Canadian Forestry Service there are six regional forest research centres, six forest research institutes, two forest products laboratories, and one independently operating forest experiment station. Collectively, these establishments undertake research and operations either on a regional or a national basis. The program of the Canadian Forestry Service includes forest resource research, development and services; forest products research, development and services; aid to universities; and special assignments.

Forest resource research. The work undertaken in this category covers research, surveys and related services pertaining to forest land and soils; forest inventory and mensuration; silviculture and tree biology; timber harvesting; protection against fire, insects and diseases; and forest economics.

Research is proceeding on methods of combining forest land and forest inventory data to achieve improved forest and environmental management. An important part of this work is conducted under a co-operative program of watershed research in Alberta. In forest-soils research, programs dealt with include soil chemistry, soil biology and the hydrologic characteristics of watersheds but, currently, considerable emphasis is being given to forest fertilization and related mineral-nutrition studies.

Considerable attention is devoted to large-scale aerial photography; ultra-small-scale, high-altitude aerial photography and satellite imagery in developing improved methods for taking forest inventory and mapping vegetation. A large operational task that has followed from aspects of this work has been the mapping of vegetation in the 1,000-mile-long Mackenzie Transportation Corridor. Evaluation of imagery from the ERTS is currently a priority research program. Studies of growth and yield, the evaluation of site potential, and the development of mathematical models for trees and forests are continuing to provide valuable information for reforestation operations and for forest management.

A substantial portion of the research program in silviculture involves the study of factors responsible for the success or failure of natural regeneration following various methods of cutting and treatment of seedbeds; the development of improved methods of regenerating forest stands following logging or fire; and the establishment of forests on abandoned farmland, heathland or bogland. Different methods of seeding and planting are being compared, and increased emphasis is being given to problems associated with container planting. The effects of mechanization of logging on reproduction and on slash and soil conditions are being investigated. Studies of different methods of stand-tending such as pruning, cleaning and thinning are under way to determine means of increasing both quantity and quality of wood production. Investigations of successional changes are in progress in most of the important forest types, and the relation of forest growth to site is being studied with a view to the assessment of long-term productivity. The light, temperature and moisture conditions required to produce optimum growth and development of various tree seedlings are being determined to provide guidelines for improved forestry practices. Tree breeding studies include research on the pattern of genetic variation throughout the distribution range of several commercially important species to identify, select or develop superior strains. The

ecological impact of a variety of forestry practices is also under study with a view to producing environmentally sound management patterns for the nation's forests.

Research on timber harvesting has been intensified by work conducted within the logging development program of the Forest Management Institute. The objective of this work is to improve logging productivity and reduce the cost of wood delivered from the standing forest to the consuming mills.

Adequate protection of forests against fire is of vital importance in Canada. The Service works in full co-operation with provincial forest services in almost all phases of forest fire control and has made major contributions in the fields of forest fire danger measurement and forecasting and in fire control planning. Investigations are being made of forest fire behaviour, of the use of prescribed fire for hazard reduction and seedbed preparation, of better methods of reporting forest fires, and of fire damage appraisal and related factors in forest protection standards. Studies are being continued in the use of chemicals for fire suppression and pre-suppression, of fire-fighting equipment and techniques, and of the use of aircraft in forest fire control. Another important field of endeavour is the study of fire hazard created by slash from various kinds of logging practices for different species.

Research on forest insects and diseases is conducted at Service research centres and field stations throughout Canada. A Canada-wide survey is undertaken in co-operation with the provincial forest services and forest industries to maintain an annual census of forest insect and disease conditions and to detect and predict the occurrence of outbreaks. Survey results are made available to owners and operators of forest lands for use in planning salvage programs and directing control measures to reduce damage.

Experiments are also carried out in insect and disease control, utilizing cultural techniques, chemicals and biological control agents including parasites, predators and insect pathogens. Technical advisory services are provided in evaluating quarantine programs, possibilities of eradication or control, or other applications of research results. Examples include recommendations for reduction of seedling losses in forest tree nurseries through cultural techniques and chemical applications; the co-operative organization of cull surveys to improve forest inventories; consultation and advisory services for local authorities on the Dutch elm disease problem; and technical co-operation with provincial governments and industrial agencies in the organization of spraying operations. Of particular significance in the summer of 1972 were the large-scale chemical control operations covering about 6.8 million acres of forest land infested with spruce budworm in the Maritimes, Quebec and Ontario areas. In addition, 425,000 acres on Anticosti Island were treated against hemlock looper.

Research programs are designed to lead to comprehensive understanding of the biology and ecology of the more destructive forest insects and fungi, and the causes of fluctuations in abundance or severity of damage in time and place. Problems under intensive study include insect defoliators, leaf diseases, sucking insects, dwarf mistletoe, stem cankers, bark- and wood-boring beetles, trunk and root decays, tip- and root-boring insects, and diseases of tree seedlings in forest nurseries. Problems of national importance in insect pathology, cytology and genetics, bio-climatology and chemical control are investigated.

Current forest economics research is concentrated on studies of future supply and demand; assessment of the impact of forest resources and forest industry on local, regional and national economies; and the evaluation of quantifiable and non-quantifiable benefits which flow from the forest. Specific projects include those covering the compilation and assessment of forest inventory data on a national basis, investigations on potential forest products trade, trends of wood use in residential construction, the implication of pollution control measures for forest industries, and the development of methods for predicting lumber prices.

Forest products research. This work is directed toward obtaining background data on the properties of Canadian woods, developing new and better uses for wood products, improving methods of processing, effecting more complete utilization of wood substances, and reducing the pollution of air, water and land which may result from the operation of forest industries. Activities cover all major aspects of forest products and include: the determination of the physical, mechanical, chemical and anatomical properties of wood and their relation to adaptability in use; studies of factors affecting quality of wood and of manufactured wood products; determination of factors that cause wood waste in logging and manufacturing; investigation into fire retardant treatments, the preservative treatment and painting of wood and the use of wood for the manufacture of a variety of products by chemical or mechanical

means; and studies to determine possible new economic and more valuable uses for woods and to determine methods for the economical utilization of all wood substances available from the annual timber harvest.

The program is conducted mainly at two laboratories located in Ottawa and Vancouver, with research units covering timber engineering, containers, glues and gluing, veneer and plywood, timber physics, wood chemistry, pulping, wood preservation, paints and coatings, wood pathology, products entomology, wood anatomy, lumber manufacture and lumber seasoning. Research results are made available to the thousands of plants comprising Canada's timber-manufacturing and wood-using industries. Liaison is maintained with these industries to ensure that the research being conducted is of optimum national benefit. There is also constant co-operation with various government units in conducting many investigations concerned with wood use. Research into the use of wood in housing construction and as an engineered material continues in co-operation with the National Research Council and the Central Mortgage and Housing Corporation.

Through the medium of research contracts awarded to industry, provincial research councils, universities and others, a program has been established to abate pollution caused by the pulp and paper industry. The objective is to find cheaper and better methods for reducing the amount of suspended solids, dissolved wood substances and harmful chemicals released into receiving waters.

A number of regional establishments have forest products liaison officers who visit sawmills and other wood-working plants to keep industry aware of research developments and technical advances and to ensure that the Service is informed of field problems on which research would be of value.

Continuing research on the economics of forest products covers a survey of lumber and wood-based panel products utilized in residential dwellings, together with a study of possible future markets for lumber and plywood.

Service personnel serve on many national and international technical committees concerned with forestry problems, and continuous collaboration is maintained with forest products laboratories in other countries for the dual purpose of exchanging information and avoiding duplication of research.

Aid to universities. Operating grants are made to the forestry schools at the University of New Brunswick, Université Laval, the University of Toronto and the University of British Columbia to support research by faculty members and postgraduate students. In addition, extramural research grants are made to Canadian universities and other agencies, such as provincial research councils, to conduct forestry research of interest to the Canadian Forestry Service.

Special assignments. From time to time the Service contributes to priority studies which are specially directed, co-ordinated and funded. The Mackenzie Transportation Corridor Study is an example.

9.2.4.3 Fisheries research

The Fisheries Research Board of Canada was established to conduct basic and applied research on Canada's living aquatic resources, their environment and their utilization. Its antecedents go back to 1898 as it is the lineal descendant of the Biological Board, one of the oldest government-supported research organizations under the supervision of an independent scientific board in North America.

The Board is under the jurisdiction of the Minister of the Environment and consists of a permanent chairman, who is appointed by the Governor in Council and is a member of the Public Service of Canada, and not more than 18 other members holding honorary appointments from the Minister of Fisheries for five-year terms. The Act requires that a majority of the members of the Board, not including the chairman, shall be scientists, and the remaining members shall be representative of the Department (of the Environment) and the fishing industry. The scientific members are drawn principally from universities and research foundations across Canada, to include specialists in disciplines related to the Board's work. The industry members are selected from among Canada's leading businessmen with an intimate knowledge of fishing and the fishing industry, and the Fisheries and Marine Service of the Department of the Environment representative is usually a senior staff member in Ottawa. Board members have both advisory and executive functions. The advisory functions

are delegated to regional advisory committees who conduct on-the-spot regional reviews and report to the Board on the operations and scientific programs with a view to their improvement. The executive functions are delegated to an executive committee elected from Board members and approved by the Minister.

The Board's operations are decentralized with only a small administrative, supervisory and publications staff in Ottawa. The responsibilities of the Ottawa office include planning and program co-ordination and administration of a grant program to encourage university research in the fields of marine and aquatic science.

The commercial and recreational fisheries program is designed to add to fundamental knowledge concerning Canada's vast living marine and freshwater resources. Included are life history, population and behaviour studies leading to a sound scientific basis for the conservation and management of the commercially important fisheries including those for lobsters, crabs, shrimps, oysters, scallops, clams, marine mammals and other economically important aquatic species, such as salmon, cod, herring and halibut, as well as some marine plants, such as phytoplankton and seaweeds. Also included are studies in fish and shellfish diseases, fish predators and such basic studies as fish genetics, physiology and behaviour, the latter with a view to improving fish cultural and farming methods and also to improving fish farm and hatchery stocks. In addition to these basic studies, new fishing grounds and new species for exploitation are sought and experiments in improving fishing methods are undertaken.

On the Atlantic Coast this work is conducted out of research stations in St. Andrews, NB, and St. John's, Nfld.; work on arctic fisheries and on sea mammals is directed from a laboratory in Ste-Anne-de-Bellevue, Que.; freshwater work is carried out from a station in Winnipeg, Man.; and work on the Pacific Coast is directed from research laboratories in Nanaimo, BC. The Board operates 16 research vessels for its biological studies varying from small inshore and lake craft to specially built seagoing ships. The Board acts as Canada's research agent for three international fisheries commissions and two international sea-mammal commissions to which Canada is party.

The aquatic environment program studies the marine and freshwater environment in which aquatic organisms live, in order to increase knowledge in primary and secondary productivity and the occurrence of ocean and freshwater life of importance to man. Considerable importance is placed on increased research efforts associated with pollution prediction, abatement and elimination, including the effects of freshwater and marine eutrophication. Investigations are also conducted into the distribution and physical and chemical characteristics of major ocean currents and the physical and biological structures of large ocean areas including the ocean bottom where concentrations of fish and other aquatic life occur. Ocean climate and ocean weather as they affect the distribution of fish and other living organisms, as well as the vertical and horizontal distribution of nutrient matter and the cycle of energy and life in the seas, are regularly observed and correlated. These studies, as well as special studies of interest to the Armed Forces, the Ministry of Transport and the international fishery commissions, are carried out by groups operating from Dartmouth, NS, Winnipeg, Man., Burlington, Ont., and Nanaimo, BC, with strong ship support from the Armed Forces and the Ministry of Transport, and with the co-operation of the Department of Energy, Mines and Resources.

Investigations aimed at improving methods of preserving, processing, storing and distributing fish products, as well as of utilizing all parts of the fish, are carried out. These include developments in refrigeration and the use of antibiotics as fish preservatives, improvements in canning, smoking and salting of fish, and the development of new products for the utilization of abundant species that are not now used for food. Fundamental research on the structure and composition of fish proteins, marine oils, hormones from aquatic organisms and other products from the sea is under way. These studies are carried out in research laboratories at Halifax, NS and St. John's, Nfld. on the Atlantic Coast; at Vancouver, BC, on the Pacific Coast; and, for inland products and processing, at Winnipeg, Man.

9.2.5 Department of Communications

The Communications Research Centre (CRC) of the Department of Communications, with a staff of about 500, carries out research and development in a number of communication-related areas. The main CRC site is at Shirley Bay, Ont., 15 miles west of

Ottawa; there are also a number of experimental sites, some at remote northern locations such as Resolute Bay.

The major activity of the Department is the Communications Technology Satellite (CTS) program. The satellite, to be launched in 1975, is being constructed at CRC and represents a major new undertaking for the Centre's staff. They draw on invaluable experience gained in the highly successful Alouette and ISIS satellite research programs conducted during the previous decade.

One major project involves a joint study by CRC and universities into the feasibility of a Canadian computer communications network (CANUNET). Other research areas include: computer graphics systems; effectiveness and impact of two-way video, audio and graphics communications services for institutional user groups; computer image processing; optical data storage and processing, and optical propagation in glass fibres. Studies of computer signal processing have been undertaken for the Department of National Defence.

Communications systems. Research in communications systems supports the Department's mission to develop and introduce new systems and facilities for Canada's domestic and international communications needs. One of the most important new developments in this field is the introduction of satellites for domestic communications, navigation and other applications.

Communications experiments are being developed to test and demonstrate the applications of the high-powered transponder to be carried in the Communications Technology Satellite. This transponder will enable it to beam back to earth a much more powerful signal than present satellites. Studies cover the problems of providing colour television, wide-band data transmission and audio broadcasts to low-cost terminals in remote regions. Provincial governments, industry, universities and other organizations are to propose experiments to be carried out in the satellite's expected two-year lifespan. Experiments are being carried out to study propagation in the super-high frequencies which will be used by future satellites. Studies continue to develop advanced satellite terminals for use by the Department of National Defence in land, sea and air environments. Research also continues in the area of proposed communications and navigation satellites for aeronautical communication at extreme latitudes. The latter is a joint program with the Ministry of Transport and supports Canada's participation in international studies of these proposed navigational aids.

The Communications Technology Satellite program began officially on April 20, 1971, when the Department of Communications and the US National Aeronautics and Space Administration (NASA) signed a Memorandum of Understanding. Under the agreement, Canada will design, build and operate the experimental satellite and NASA will provide some advanced components and launch the satellite into a geostationary orbit. The program will allow Canada to evaluate the technological, economic and social benefits which could be provided by such a powerful satellite broadcasting to small, low-cost ground terminals in remote areas. Another important objective is to test, under actual space conditions, various items of advanced design which might be suitable for telecommunications satellites. The ten-nation European Space Research Organization (ESRO) has asked to participate in the program by providing some components which it hopes to use on its communications satellites for the 1980s.

Under CRC direction, a team of experts from various industries established initial design concepts and a basic spacecraft configuration for the Project Definition Plan. Industrial proposals were then invited for spacecraft design, and design contracts were awarded to Spar Aerospace Ltd. of Toronto for the structure and RCA Ltd. of Montreal for the electronics.

Information sciences. Research in information sciences seeks ways of improving machine-to-machine communications, man-to-machine interactions and man-to-machine telecommunications services. This basically involves finding better ways to use new technology for storing, processing and retrieving information.

Communications systems engineering has increased, and the technique of systems modelling is being used as part of a study of data communications requirements. Research and development in the radar field includes assistance in communications and remote sensing programs for the Departments of National Defence and Energy, Mines and Resources.

Radio environment. Studies of the radio environment focus on problems peculiar to Canadian latitudes. Much of the work involves systems such as high-frequency radio which depend on the ionosphere, and studies of the limitations imposed by ionization variations resulting from natural and man-made conditions. A varied observational program is pursued using ground-based equipment at a number of locations, rocket-borne experiments and satellite observations from the Alouette and ISIS satellites. Related studies deal with: direct effects of ionospheric conditions on spacecraft antennas, noise and interference levels in various locations in Canada, and the use of different portions of the radio spectrum for practical purposes such as remote sensing. CRC continues to provide a radio prediction, casting and consulting service to Canadian communications users.

Spacecraft technology. Applied research in advanced electronics and space mechanics supports Canadian efforts in the field of communications satellites, particularly the Communications Technology Satellite program. The research concentrates on areas not yet adequately covered by Canadian industry. A new and difficult problem is the reliable stabilization in space of a satellite with large flexible appendages, such as the CTS with its extendable arrays of solar cells. This differs considerably from the present generation of communication satellites, including Anik, which are stabilized by spinning the satellite body. New electronic devices, materials and technologies are required, as well as a superior standard of component reliability.

Although the program is specifically intended to support communications, research results often can be applied elsewhere, in fields such as medical electronics and pollution control. For example, research in reliability analysis resulted in the design of a specialized scanning electron microscope at CRC. Through Canadian Patents and Development Limited, a new Canadian company was formed to manufacture this instrument and multi-million dollar sales were forecast.

Outside research. The Department's program of research contracts to universities has been set up in five major categories: northern communications technology, man-machine interaction, computer technology, machine intelligence, and socio-economic aspects of communications. Some 44 contracts, a commitment of about \$700,000, have been approved for universities across Canada. The object is to create a resource for contract research in Canadian universities to which the Department and other agencies may go in future to meet specific requirements. In the 1972-73 fiscal year about 30% of the contracts were aimed at research on the social, economic and legal-regulatory aspects of communications in modern society.

Liaison has also been strengthened with other research laboratories in government and industry. This is facilitated by the increasing number of electronics and communications industries which have located in the Shirley Bay area in recent years, although the site of CRC was originally chosen as an electronically "quiet" rural area. Many of the Department's research projects involve contracts with industry, with CRC providing design authority and project management. Research projects are also carried out at CRC for other government departments and agencies on a cost-recovery basis. About one fifth of CRC manpower is devoted to work on behalf of the Defence Research Board, providing research and development in the field of telecommunications for the Department of National Defence.

9.2.6 Department of Industry, Trade and Commerce

The results of research, development and advanced technology are regarded by the Department of Industry, Trade and Commerce as a major resource essential to the achievement of efficient and sustained growth in the production and trade of Canadian goods and services. As tariff barriers are lowered and as natural resources become more easily replaceable and transportable, technological innovations will be a key factor in the economic growth of industrially advanced countries. Emphasis is thus placed on the level, distribution and quality of the national effort directed to the advancement and application of science and technology. A major function of the Department is to promote and assist product and process development and to increase productivity in Canadian industry through the greater use of research and the application of advanced technology. The Department achieves these objectives mainly through the use of financial assistance programs.

The Industrial Research and Development Incentives Act (RSC 1970, c.I-10) provides a general incentive for scientific research and development. Its objective is to induce Canadian corporations to undertake additional research and development likely to result in economic

benefit to Canada through the eventual production of new and improved products and processes for sale in domestic and foreign markets. Any taxable Canadian corporation carrying on business in Canada may apply for a grant which is based on the corporation's expenditures for scientific research and development carried out in Canada. Since the inception of the program in 1967, some \$107 million has been authorized for payment to Canadian corporations for scientific research and development to be conducted in Canada. Of this amount, \$31.3 million was authorized for payment during the year ended March 31, 1972.

Financial assistance for selected projects to develop new or improved products and processes which incorporate new technology and which offer good prospects for commercial exploitation in domestic and international markets is provided under the Program for the Advancement of Industrial Technology (PAIT). The basic aim of this program, established in 1965, is to help Canadian secondary industry upgrade its technology and expand its innovative activity by underwriting the technical and market risks of specific product or process development projects involving a significant technological advance. In 1971 the program was expanded to include operations and market research, and systems and applications studies directly related to market potential or increased productivity. Applications for PAIT assistance are appraised as to the technical and commercial feasibility of the project, the capabilities of the company to carry it out, and the project's potential contribution to the economic growth of Canada. Projects supported include the development of a water bomber aircraft, satellite communications equipment, electromagnetic prospecting equipment, flight and safety devices, advanced machinery and machine tools, wood-harvesting equipment, and data display devices. From the inception of the program in 1965 to March 31, 1972, the Department made commitments to provide assistance to the extent of \$126.8 million for 515 projects having an estimated value of \$247.4 million.

In order to compete for and participate in the development and production programs of other NATO countries, Canada's defence industry must keep pace with product developments and advances in manufacturing technology dictated by the requirements of modern military equipment. The Defence Industry Productivity (DIP) Program is designed to enhance the technological competence of the Canadian defence industry in its export activities by providing financial assistance to industrial firms for selected projects. Emphasis is placed on those areas of defence technology having civil export sales potential. Assistance may cover the development of products for export purposes and the acquisition of modern machine tools or other advanced manufacturing equipment to meet exacting military standards as well as pre-production expenses to establish manufacturing sources in Canada for export markets.

Projects initiated under the DIP Program have been instrumental in helping industry to develop its skills on a specialized basis in fields of technology that have defence and civil applications and which Canada is favourably situated to exploit. Costs of these projects are shared by the Department and the Canadian firm concerned and, in some instances, by the governments of other NATO countries. Among the projects that have received assistance are communications and aircraft navigation systems, gas turbine engines for aircraft, flight safety and simulation equipment, and information display facilities. Exports of the products of these developments continue to increase, including significant orders for such diverse applications as commercial airlines, public communications networks and television distribution systems. Since the inception of the Program in 1959, more than 597 projects involving a contribution of some \$344 million have been supported.

The Department assists small firms in Canada to keep abreast of technological advances and to maintain a more competitive position in world markets through the establishment of three programs. As a result of the financial assistance provided by the Centres for Advanced Technology Program, instituted in 1968, universities and other organizations are able to establish centres of expertise in fields where industry is unable to conduct the research necessary to develop new areas of technology, or where many industries seem likely to benefit from research into a common technological area. Three centres have been established — the Canadian Institute of Metalworking at McMaster University, the Centre for Powder Metallurgy at the Ontario Research Foundation and the System Building Centre at the University of Toronto. Through the Industrial Research Institutes Program, scientific services are available to industrial firms unable to maintain research facilities and personnel of their own, thus helping to alleviate the shortage of scientific and technical resources that exists in Canadian industry, to foster a closer relationship between universities and improve their

understanding of the problems of industry, and to help industry become acquainted with the latest pertinent scientific and technical developments. Institutes have been formed at the University of Windsor, McMaster University, the University of Waterloo, Nova Scotia Technical College, McGill University, L'École Polytechnique, the University of Guelph and Ryerson Polytechnical Institute. Through membership in industrial research associations, in which member companies may undertake on a co-operative basis research and development and related scientific activities such as technical information, technical consulting, analysis and testing, etc., small- and medium-size companies acquire research and development and other scientific services which they are unable to afford on their own.

The Department is actively engaged in scientific and technological exchanges with foreign countries for the purpose of stimulating innovation in Canada, promoting industrial development through licensing arrangements, encouraging joint research and development projects in specific areas of technology, and developing existing and new markets for Canadian technological products. To facilitate such exchanges, bilateral science and technological agreements have been signed with Belgium, the Soviet Union, and the Federal Republic of Germany, which provide for annual consultations and review of activities. The Department also participates in the activities of international organizations which are concerned with the industrial application of science and technology.

Co-ordination of policies relating to the government's industrial assistance programs is achieved through the Interdepartmental Committee on Innovation. The Committee's terms of reference include a continuing review of program objectives and policies, studies of the environmental factors affecting the innovation process in Canada and comparison with other countries, studies concerning the relationship between investment in industrial research and development and economic growth, analysis and review of the government's policies and programs with respect to procurement and the relation of the level of R&D activities in government establishments to that of financial assistance to R&D in industry.

9.2.7 Ministry of Transport

The Ministry of Transport's Transportation Development Agency is one of the prime participants in scientific and industrial research in the field of transportation. The following sampling of projects now under way gives some indication of the range of studies supported. Mackenzie River Basin study: to identify and evaluate transport requirements and costs of moving people and goods to, from and within the Basin area over the next 15 years. Capsule pipeline experimental research: to develop capsule pipeline transport technology in Canada and evaluate its economic viability; this project is contracted to the Alberta Research Council. Regina Telebus demonstration: to test a demand-responsive transit system as an alternative to the automobile in low-density areas and the possible application of this technology to other Canadian cities; this project is undertaken in co-operation with local and provincial authorities. Northern resource transportation: to evaluate a number of multi-modal transportation systems within various circumstantial scenarios to move gas and oil from the Arctic Islands. Magnetic levitation: to conduct applied research into the use of superconducting magnets for the levitation and propulsion of guided ground vehicles; this work is being done by personnel from Queen's University and the University of Toronto in co-operation with the Canadian Institute of Guided Ground Transportation. Sonic boom research: to evaluate alternatives in co-operation with other federal departments and agencies and to formulate policy for the handling of supersonic aircraft movements in Canada. Bell "Voyageur" evaluation: to conduct operational trials in the Mackenzie River Basin and environs in order to establish the operational, technical and economic capabilities of this Canadian-built air-cushion vehicle. Commodity flows of Canadian exports: to show the transportation routes and modes of Canadian exports from each economic region to their destination abroad. Slurry pipeline experimental research: to obtain technical information on small-scale and full-scale solids pipelines for the materials most likely to be transported by this method in the future; this project is being conducted by the Saskatchewan Research Council in co-operation with the University of Saskatchewan.

9.3 Provincial scientific research organizations

Nova Scotia, New Brunswick, Quebec, Manitoba, Saskatchewan and Alberta have established research councils or foundations and Ontario and British Columbia have assisted financially in the setting up of such organizations. Most provincial governments have

university laboratories to consult about local industrial and agricultural problems and many individual departments have facilities for research or assist research through the provision of financial aid to students working in those and other scientific fields. Provincial research efforts in forestry, fisheries, agriculture and mining are covered in Chapters 10, 11 and 12.

9.3.1 Nova Scotia Research Foundation

This body was created by the government of Nova Scotia in 1946 to provide industry and government with scientific and technical assistance in finding new and better ways to utilize the natural resources of the province and to assist the processing industries. The Foundation's laboratories are located in Dartmouth and were built with funds granted by the Atlantic Development Board on a ten-acre site donated by the province. The building was first occupied in 1969 and now houses a staff of 68 which includes 54 scientists and technicians.

The Foundation is governed by a board made up of scientists and industrialists and its operations are carried out in seven divisions. The Geophysics Division carries out gravity, seismic, magnetic, well-logging and electromagnetic surveys on land, and seismic bottom profiling and magnetic surveys at sea for industry and for government. It sponsors a program of research on the surficial geology of Nova Scotia. The Chemistry Division, through research and development, utilizes the minerals and other natural resources of the province to develop new processes and products. Contract services are available to industry and government in areas of inorganic and food chemistry, pollution control and chemical engineering.

The Operational Research Division provides a service for industry and government by utilizing the mathematical techniques of systems analysis and undertakes projects in the area of optimal resource allocation, production scheduling and distribution. The Engineering Physics Division makes available developments in applied physics to Nova Scotia industry. Emphasis is at present placed on research and development in electronic and mechanical engineering and in measurement techniques. The Technical Services Division provides technical information on materials, equipment and processes and gives industrial engineering assistance to manufacturing industries. The various sections include technical inquiries, industrial engineering and a related information centre. The Applied Biology Division carries out research on the distribution, growth, conservation and utilization of commercial seaweeds. The Division is also involved in microbiological research related to water pollution and the treatment of industrial waste waters. The Library is well stocked with scientific and technical information to aid the Research Foundation staff, industry and government.

A *Research foundation bulletin*, issued occasionally, keeps industry advised of Foundation activities and of important discoveries in science and technology. The *Research record* gives a descriptive account of past research projects. Annual reports are published on a regular basis.

9.3.2 New Brunswick Research and Productivity Council

The Council is a body corporate set up in 1962 by an Act of the government of New Brunswick. It is governed by an independent group of prominent citizens from management, labour and the professions, which meets four times a year. Members are appointed for three-year terms by the Lieutenant-Governor in Council, one as chairman who reports to the Premier annually. The greater part of the capital investment was provided by the Government of Canada but the province makes an annual operating grant from its Consolidated Revenue Fund. Additional funds are derived from cost-recovery fees, services under contract, sponsorship, etc. The Executive Director has charge of all matters relating to the administration of Council affairs and has supervision over and direction of the work of the staff.

The Council maintains a well-equipped centre for engineering and problem-solving, industrial research and development and, in addition to its provincially oriented projects, conducts research on a cost-recovery basis for clients in other areas of Canada and in other countries.

9.3.3 Quebec Industrial Research Institute

The Quebec Industrial Research Institute, established by a National Assembly Act on December 12, 1969, is a corporation as defined in the Civil Code. The Institute is composed of a Director General and 14 members from industry, university and government, appointed by the Lieutenant-Governor in Council. Its main objectives are: research in applied sciences carried out either in its own laboratories or in those of other research institutes; development

of products, processes and equipment of an industrial or scientific nature; and collection and distribution of technological and industrial information. Headquarters are located in the vicinity of Quebec City.

9.3.4 Ontario Research Foundation

The Ontario Research Foundation (ORF), established in 1928, is an independent corporation. It derives its powers from a special Act of the Ontario Legislature and is responsible to a board of governors consisting of leading members of the industrial, commercial and scientific communities who are appointed by the Lieutenant-Governor in Council. The organization was financed initially by an endowment fund, provided by industrial and commercial corporations through the Canadian Manufacturers' Association, and an equal block grant from the provincial government. Most of its current income is derived from contract research undertaken mainly for industry. In recent years the Ontario government has provided a direct annual grant to ORF, the amount of which is directly proportional to ORF's income from industry.

The Foundation is concerned primarily with the development of Canadian industry through the application of science and technology. Also, at the request of the various departments of the Ontario government, it undertakes work relative to the natural resources of the province. Foundation activities are not restricted to the province; work is undertaken for any organization in Canada on the same basis.

The Foundation undertakes industrial research and development for companies and governmental agencies as requested, particularly with respect to natural resources and to defence; provides and maintains an effective and efficient applied research and development facility for the use of industry and government agencies, using funds provided by the Ontario government to support the back-up research necessary for this purpose; and brings to the attention of industry and governmental agencies research opportunities that promise economic or social benefits. Situated in the Sheridan Park Research Community, 17 miles west of Toronto, and serving as the nucleus of that scientific centre, ORF has a staff of approximately 285 scientists, engineers, technicians and service personnel.

Since its establishment, ORF has provided both large and small companies with research and development services. These have ranged from short-term investigations and feasibility studies, through product and process development to long-range fundamental scientific investigations. All research and development projects are conducted on a confidential basis, including all business, technical or proprietary information revealed to ORF by clients or prospective clients. Patents resulting from research and development studies are assigned to the client.

9.3.5 Manitoba Research Council

The Manitoba Research Council consists of seven members and 16 advisory members representing natural-resource-based industry, manufacturing, labour, the universities and government. Permanent staff members are provided by the provincial government. Its work is financed by provincial government appropriations, although fees and service charges may be levied for its services. The objectives of the Council are to promote or carry out, or cause to be promoted or carried out, research and development investigations related to the natural resources and industrial operations of the province. At present, research sponsored by the Council is performed in the existing research laboratories of the province. Much of the research is aimed at establishing Manitoba as a centre of excellence in food products, electronics, materials research and building systems. In addition, through a technical information service, industries are encouraged to incorporate in their operations new technological developments. The main reason for the establishment of the Council is to assist Manitoba industry to improve its market position by developing a more scientifically based production capability. The Council maintains an office in the Provincial Government Administration Building (Norquay Building) in Winnipeg.

9.3.6 Saskatchewan Research Council

This Council was set up in 1947 under an Act of the government of Saskatchewan. The Council carries out research in the physical sciences with the aim of improving the provincial economy with particular emphasis on the commercial exploitation of provincial resources and the scientific aspects of business. At first the Council had no scientific personnel and

laboratory facilities of its own, its research programs being carried on at the University of Saskatchewan by means of grants to members of the staff and scholarships to graduate students. The 1947 Act was amended in 1954 to empower the Council to acquire property, employ staff and conduct its own financial affairs. Laboratory buildings were erected on the university campus in 1958 and were extended in 1963. The present program places emphasis on technical assistance to industry and provincial government departments, research in the areas of metallic and industrial minerals, water, the environment, slurry pipeline transportation and selected aspects of agriculture. A large part of the program is carried out by the permanent staff numbering about 70 but some of the Council's research is still promoted by grants to university staff. The members of the controlling body, the Council proper, are appointed by the Lieutenant-Governor in Council and consist of representatives of the Saskatchewan government, the university and industry.

9.3.7 Research Council of Alberta

The government of Alberta set up a scientific and industrial Research Council in co-operation with the University of Alberta in 1921 to promote mineral development within the province. Considerable effort is still directed toward the development of natural resources, but increasing emphasis is being given to research related to the establishment of new industries within the province, to transportation and to environmental problems. The principal areas of activity are fossil fuels development and utilization, geological surveys and research, groundwater, soils, industrial minerals, chemical product and process development, microbiology, technical assistance to industry, gasoline and oil testing, pipeline transportation, highway research, river engineering, environmental studies and hail research.

The operations of the organization are controlled by a Council of 15 individuals representative of the Alberta government, the universities and industry. The various research fields are reviewed by advisory committees of specialists drawn from industry, the universities and provincial government. The activities of the Research Council of Alberta are financed by provincial government appropriations and by contract research for private industry and federal agencies.

The main Council laboratories and offices are located on the University of Alberta campus in Edmonton. A pilot plant and laboratory facility is located in the Clover Bar area east of the city. The full-time staff comprises approximately 230 scientists, engineers, technologists and supporting personnel.

9.3.8 B C Research

B C Research performs a technical function for the British Columbia Research Council, a non-profit, industrial research society with offices and laboratories at Vancouver, BC. This function is to enable even the smallest firms to improve their competitive position in Canadian and world markets by the use of the most up-to-date scientific knowledge. B C Research carries out contract research for clients on a confidential basis, initiates "in-house" research programs designed to promote and utilize the resources of the province, and provides a free technical information service in collaboration with the National Research Council. B C Research is active in the areas of applied biology, chemistry, engineering, physics, operations research, industrial engineering, industrial market studies and economic feasibility studies.

9.4 University research

University research in Canada is funded from many sources. A large part of the total cost is covered by funds not specifically assigned to research activities. The proportion that should be attributed to research is often a matter of opinion as it concerns the apportioning of academic salaries between teaching and research, maintenance, etc. A special study conducted for the Science Council of Canada and the Canada Council indicated that in 1966-67 the total cost of research in Canadian universities was about one half of the total university expenditure. This analysis has not been repeated but no major change in the proportion is expected. Most of this cost is borne by the provincial jurisdiction over education and the federal responsibility for research.

The main components of research costs are: assisted research funds — grants and contracts to institutions or members of the staff; awards, such as research fellowships and scholarships; pro-rated value of faculty time devoted to research; and other indirect costs including pro-rated costs of libraries, administration, maintenance and publications. The appropriate

part of the capital cost of buildings and facilities is often included in operating expenditures, e.g., when financed from grants for assisted research. Most research equipment is provided through such grants. Indirect costs are not normally broken out in university accounts and are covered primarily from general funding of university education by the provincial governments. However, in accordance with the Federal-Provincial Fiscal Arrangements Act, 1967, the federal government reimburses the provinces for at least 50% of the operating costs of all post-secondary education. It follows that one half of the above indirect cost of research is, in the end, covered by federal funding.

Assisted research funds represent part of the direct costs of research and include all funds channelled through universities, even though most of them are assigned to individual researchers. These funds are intended to pay for equipment, materials, travel and research assistance, including student assistance, and cannot be used to provide or supplement the salaries of the staff. Scholarships and fellowships provide personal incomes for some staff members and for graduate students or postdoctorate fellows; some are tenable abroad and some are reserved for foreign students in Canada as a part of foreign aid.

Most of the assisted research funding is granted for specific purposes, mainly in response to proposals made by the universities. These grants have the most direct influence on both the magnitude and the nature of university research. Because of this direct link their total monetary allotment can be used as a gauge of research activities in Canadian universities. During the past decade, assisted research funds rose gradually from \$26.5 million in 1961-62 to \$152 million in 1970-71, representing about 12.5% of total operating expenses throughout this period.

Assisted research funds are derived from several sources. The major source in 1970-71 was the federal government, contributing \$105 million, or 69.1% of the total; \$23 million (15.1%) came from provincial sources and \$24 million (15.8%) from foundations, business enterprises and other sources. This distribution has varied only slightly over the past few years and indicates the predominant influence of federal financing on university research in Canada. This would still be true if direct awards to individuals (research scholarships and fellowships) were included in the above figures. Assisted research funds include the support of the social sciences and the humanities but that part represents only a small percentage of the total shown here, particularly since most of such support is in the form of direct awards, by-passing university accounts.

Federal support for research in universities can be divided into three main components coming from two types of sources. The main elements are the grants and contracts program, the awards (scholarship and fellowship) program and the support of related scientific activities including research publications, acquisition of research collections and symposia. The major sources of support in 1972-73 were the National Research Council (NRC) and the Medical Research Council (MRC), contributing \$58.4 and \$33.6 million, respectively. Other significant sources included the Department of National Health and Welfare (\$19.1 million), the Atomic Energy Control Board (\$7.5 million), Environment Canada (\$3.4 million), and the Defence Research Board (\$3.4 million). All other departments and agencies combined contributed \$6.4 million for an over-all total of \$131.8 million. The above data include the allocation of funds to non-profit organizations and cover development as well as research. The development component is small and the line between research and development is difficult to draw in many fields, such as health sciences. The non-profit institutions for the most part consist of hospitals and research institutes where research is carried out mainly by academics. On the other hand, scholarships supporting primarily education rather than research, fellowships tenable abroad, and support of some related activities are excluded.

An extremely important role is played by the NRC and the MRC in support of university research, since about 70% of the federal funding comes from these two Councils. The National Research Council has the responsibility for supporting research in the natural sciences and in engineering; it is the largest sponsor of research in Canada. The Medical Research Council, under a new Act adopted in 1969, assumes responsibility for research support in all the disciplines in the health sciences exclusive of the public health field. This represents an extension of its former terms of reference which encompassed only medical research.

The purpose of support for research by both Councils is to achieve a healthy and balanced development of knowledge in Canadian universities rather than to support any particular mission of their own. They award grants largely in response to initiatives from the universities

and their criteria for support are based mainly on the merits of the individual researcher and the excellence of the project. The direct application or usefulness of the knowledge sought is generally not given high priority in assessing a project. These funding policies have favoured the development of basic research of a high calibre in Canadian universities. The MRC assigns approximately 50% of its funding for research in certain areas which their studies indicate need more effort. The NRC exerts similar influence through “negotiated development grants” which amount to about 10% of the total funding and by indicating to prospective grantees the areas in which more proposals would be desirable.

The almost explosive growth that occurred in university research during most of the 1960s appears to be moderating. Some trends in Canadian university research have become evident and these may be accentuated in the immediate future. Foremost among these is the breaking down of the barriers between disciplines on campuses. With increasing frequency, projects are being undertaken and research institutes established that depend on the co-operation of two or more departments, faculties or even universities. Noteworthy also is the recent trend toward a greater degree of specialization on the part of universities. Special grants (Negotiated Development Grants), made available by the NRC and the MRC, encourage universities to follow this policy of specialization. Recent recommendations of the Science Council advocated more support for university research from the mission-oriented departments with the NRC and the MRC (together with the Canada Council) assuming more of a balancing role to ensure that no legitimate discipline is neglected. These Councils have established a co-ordinating committee to make certain that no gaps exist in their joint coverage. The problems of rationalization of university research, establishment of criteria for selection of projects and for distribution of support among disciplines or problem-oriented work are under active public discussion and are the subject of a number of special studies. This analysis may lead to a considerable redirection in the field of university research in Canada during the 1970s.

9.5 Industrial research

After a period of growth, expenditures on industrial research and development by Canadian firms, particularly those associated with fabrication and end-product manufacture, have now levelled off around \$400 million annually. The creation and expansion of industrial research and development units is designed to meet competition from other Canadian as well as foreign firms and to exploit efficiently the country’s natural resources. During the early 1960s, capital and operating expenditures for industrial research and development (R&D) increased rapidly, encouraged by the growth in markets, government incentives, improved production facilities, financial resources and supplies of technically skilled manpower.

Toward the end of the decade, however, total expenditures remained almost constant, accompanied by a lack of growth in the professional and supporting personnel.

The federal government is well aware of the need for a strong research and development effort in Canada and has inaugurated several programs of direct financial assistance. The Department of Industry, Trade and Commerce administers the Defence Industry Productivity Program and the Program for the Advancement of Industrial Technology (see Section 9.2.6). The Industrial Research and Development Incentives Act authorizes the Department to make substantial grants to firms expanding their research and development effort. The National Research Council has its Industrial Research Assistance Program (see Section 9.2.1) and the Defence Research Board makes grants in support of Defence Industrial Research.

The newly established Industrial Science and Technology Division of the Policy Branch at the Ministry of State for Science and Technology has the purpose of ensuring comprehensive, well-planned and integrated policies in this area. Its objective is to assure that Canada develops and maintains a strong scientific and technological capability within the industrial sector and a favourable environment for the optimum application of this capability.

In recent years the total direct federal support for industrial research and development has increased from \$75.5 million in 1965-66 to \$149.7 million in 1971-72 and is expected to reach \$160.3 million in 1972-73.

The level of employment of scientists and engineers in the various areas of industrial research and development gives a measure of the corresponding activity. The ranking of the ten leading industries in 1971 is shown in Table 9.1.

The ten industries listed absorb some 78% of the scientists and engineers employed in research and development. The first four industries alone (electrical products, other chemical products, aircraft and parts, and non-ferrous metals) employ about 53% of R&D personnel in Canada, and account for over 53% of all current intramural expenditures on R&D.

One possible method of identifying research-intensive industries is to compare the number of scientists and engineers involved in R&D with the total number of persons employed by the industry. The ranking of the ten leading industries for 1971 based on this criterion is given in Table 9.2.

9.5.1 The Pulp and Paper Research Institute

The Pulp and Paper Research Institute of Canada is a centre of research concerned with virtually every aspect of the production and use of pulp and paper products. It was established in 1913 as a branch of the Dominion Forest Products Laboratories and in 1927 was reorganized under the joint sponsorship of the Canadian Pulp and Paper Association, the federal government and McGill University. The Institute staff carries out fundamental research and some applied research in the fields of logging operations and pulp and paper mill operations. In addition, in co-operation with McGill University, it trains postgraduate students who are working toward master's and doctorate degrees in physical chemistry, wood chemistry, or chemical and mechanical engineering, and whose theses subjects lie in fields of interest to the pulp and paper industry.

The Institute's head office and main laboratories are located in Pointe Claire on the western outskirts of Montreal in a building constructed by the Government of Canada. Space provided by the University is also occupied on the campus of McGill University by Institute staff and students involved in the graduate education program. The Institute's facilities include: organic and physical chemistry, physics and engineering laboratories; pilot plants for chemical pulping, pulp and chip refining and waste liquor pyrolysis; facilities for logging research; an extensive library; shops and special facilities for pulp and paper testing and for photographic and microscopic (both light and electron) studies of wood, pulp and paper. It has a staff of about 200.

The Institute's research activities comprise a basic program in pulp and paper research and in logging research, contract research and technical services. The basic pulp and paper research program is supported by assessments from the maintaining membership (48 companies, representing more than 100 mills and about 95% of the total production of the Canadian industry). The logging research program is currently supported by a financial contribution from the Canadian Forestry Service of the federal government. Both programs comprise research of interest to the industry as a whole as distinct from that which is the concern of only a single company.

The projects in the research program range from studies of logging machine prototypes to the converted end-products of the pulp and paper industry, and are directed at eight broad research goals: reduction of wood cost, reduction of fibre cost, reduction in capital and operating costs, testing and process control, products research, reduction of environmental pollution, basic knowledge, and the transfer of technology. The Institute is regarded as a centre for broad, long-range and uninterrupted studies of basic principles and for major engineering research and development projects which individual pulp and paper companies would find difficult to justify if the costs were not shared. Moreover, the Institute is a centre of highly specialized equipment and manpower which individual companies would not normally have.

In addition to its permanent staff, the Institute, in co-operation with McGill University, has some 45 graduate students working on fundamental projects in the background of pulp and paper technology, which also serve as their theses topics. The E.B. Eddy Professor of Industrial and Cellulose Chemistry at McGill, who is also a staff member of the Institute, directs graduate student work on such subjects as the behaviour of the materials of which wood is made — cellulose, lignin and hemicelluloses. The Director of the Institute's Applied Chemistry Division, also a Professor in the McGill Chemistry Department, supervises graduate student work in polymer, surface and colloid chemistry with particular reference to those aspects that pertain to the physics and chemistry of pulp and paper. An Associate Professor of Chemical Engineering at McGill, who is a consultant to the Institute, directs graduate students in a variety of chemical studies. In addition, the Director of the Institute's Applied Physics Division, who holds a teaching appointment in McGill's Department of Mechanical Engineering, supervises graduate student investigations on such subjects as supercalendering of paper and frictional processes in polymeric systems. Other staff members who hold concurrent honorary positions at McGill as Research Associates assist in this student program.

The Institute undertakes contract research projects on a cost-reimbursement basis for individual companies or groups of companies in the pulp and paper or allied fields. The larger of these co-operative contracts have been concerned with problems of particular segments of the Canadian pulp and paper industry. The Institute also provides technical information to the industry and, to some extent, to other industries and the public. It maintains a specialized library for this purpose which stocks bibliographies, abstracts, translations and critical reviews for the use of the scientific staff and the industry.

9.5.2 Electrical industry research

Meeting the needs of society for energy resources at reasonable cost, in adequate quantity and with minimum environmental impact requires the solution of a wide range of problems related to the development of raw energy sources as well as the improvement of existing techniques. Extensive research is under way on a world-wide basis and the electrical energy field is particularly well suited to meeting energy needs within acceptable constraints set by economic, technical and social factors.

The Ontario Hydro research program dates back to the establishment of the Research and Testing Laboratory in 1912. Since then research facilities have grown appreciably and today the Research and Development Division employs over 300 people. The Division's high-voltage laboratory is capable of impulse testing at 1,250 kv and power frequency testing at up to 720 kv; this equipment can also be adapted for use as a 50,000-ampere current surge generator. A high-current-testing laboratory is presently under construction and upon completion will boast a capability of 100,000-ampere testing at up to 600 volts (single or three phase) for 0.5 second or continuous testing at up to 24,000 amperes and 300 volts (single phase).

The Research and Development Division is undertaking an extensive program to develop high-voltage transmission lines which are more compact and more aesthetically appealing. This study has yielded significant results not only in the design of new tower configurations but in many related areas as well. It was found, for example, that insulators treated with a semi-conductive glaze have greatly increased flashover strength, even in the presence of moisture and contamination. Significant achievements in the prevention of galloping in ice-laden conductors have also been made. Other studies are producing encouraging results in providing synchronized high-speed fault interruption, improved power system reliability and more efficient thermostats for the control of room temperature. The recent purchase of a scanning-type electron microscope has facilitated studies of the surface features of new alloys,

corrosion products, semi-conductive glazes on porcelain insulators and particulate pollutants.

Hydro-Quebec established the Hydro-Quebec Institute of Research (IREQ) in 1969 to provide a sound technological basis for Quebec's electric utility expansion and to provide research and testing facilities for other utilities and electrical manufacturers in Canada and throughout the world. In recognition of this national and international role, the Government of Canada provided substantial financial support to the Institute.

IREQ is located on a 600-acre site in Varennes near the Boucherville substation on the south shore of the St. Lawrence River about 18 miles from Montreal. This location was chosen to enable the Institute to be connected with Hydro-Quebec's 735-kv transmission system so that it could be used for testing and development purposes.

By the end of 1971 work on the complex had entered its third phase – construction of the high-power laboratory. Phase I, the administration building containing general laboratories, all staff offices, computers, workshops, a library and an auditorium, was completed in 1969 and became operational in 1970. The 60,000-sq-ft, 168-ft-high high-voltage laboratory (Phase II) became operational in October 1971. Utilizing impulse generators with outputs up to 6,400 kv and an energy content of 380 kilojoules, the high-voltage laboratory is capable of very sophisticated testing. The high-power laboratory, to commence operation in two stages in 1972 and 1973, will take its power source from the 735-kv transmission system but through the use of synthetic test circuits the effective short circuit power capability will greatly exceed that of the power system.

Projects under study involve: generation, transmission, distribution, system operation and power utilization. Many of the projects are under contract from interests in Canada, the United States and Europe while others are of particular interest to Hydro-Quebec. These include: studies to enable reduction in equipment costs; research into problems associated with high voltages, especially high-voltage direct current (HVDC) transmission technology; simplification of test standards; evaluation of existing and new insulation materials for cables; investigations into unconventional sources of generation, including fuel cells and thermo-nuclear fusion; studies of corrosion problems on lines and equipment; and research on the application of electrical energy to chemical synthesis.

9.6 Research and development expenditures

In 1970 Canada's current expenditures on research and experimental development in the natural sciences were estimated to be \$865 million, divided as shown in Table 9.3. The federal government is the major source of funds for research and experimental development providing 52% of the total current funds.

9.6.1 Federal expenditures

Information on the expenditures of the federal government on scientific activities is secured by two annual surveys carried out by Statistics Canada, one for the natural sciences and the other covering the human sciences. Each survey covers the actual costs of scientific programs for the preceding fiscal year and estimated expenditures for the following two years.

Natural sciences. In addition to research and experimental development, data are collected on five other classes of scientific activities in the natural sciences. These activities, often grouped as "related" scientific activities, include: scientific data collection, scientific information, testing and standardization, feasibility studies and scholarship programs. Data are also collected on personnel, sector of performance, object of expenditure, category of R&D, field of science and regional distribution of expenditures and personnel. Complete results are presented in the annual publication *Federal government activities in the natural sciences*, Catalogue No. 13-202.

Total federal government expenditures on activities in the natural sciences for 1972-73 were estimated at \$881 million, representing almost 6% of the total federal budgetary estimates. Scientific expenditures were reported by 29 departments and agencies; 11 of them spent more than \$10 million on scientific activities in 1972-73. R&D accounts for almost 72% of the total 1972-73 current expenditures; with slight variations this proportion has held constant for the past ten years. Scientific data collection – the gathering, processing, collating and analyzing of data on natural phenomena – is the principal related activity accounting for almost one half of the 1972-73 estimated expenditures for such activities. Table 9.4 shows federal scientific expenditures by type of activity and by major department or agency for the years ended March 31, 1972 and 1973.

Total expenditure by activity and by sector of performance, 1972-73

In 1972-73 approximately 59%, or \$412 million, of federal government current expenditures was for work done within its own establishments. An estimated full-time equivalent of 26,393 persons employed by the federal government were engaged in scientific activities in 1972, 16,749 in R&D work. Employees in the scientific and professional category accounted for 6,534 man-years.

Almost all payments to extramural performers of scientific activities go either to Canadian industry (51% of 1972-73 current extramural expenditures) or to educational and non-profit institutions (43%). Support of industrial R&D is provided principally through a group of special programs designed to develop a research capacity in Canadian industry by assisting current R&D work. Expenditures under such programs reached \$111 million in 1972-73. Support of research in Canadian universities and related institutions is also provided primarily through grants programs, with expenditures totalling \$124 million in 1972-73.

Human sciences. In 1971 Statistics Canada conducted an experimental survey of the human and financial resources of the federal government devoted to the human sciences. Such information had become necessary not only to complement data on the natural sciences but also because of the growing importance of these disciplines in policy decisions. The results of this experimental survey were published in *Federal government expenditures on the human sciences*, Catalogue No. 13-545.

The first annual survey of federal government activities in the human sciences was conducted in 1972 and covered most of the federal departments and agencies that have expenditures in these disciplines. As in the natural science survey the resources are measured in terms of two inputs: expenditures and manpower. Data were collected for the following activities: research, general data collection, scientific information, education support and operations studies. Complete results of this survey were published in *Federal government activities in the human sciences 1971-73*, Catalogue No. 13-205.

The survey indicated that federal departments and agencies expected to spend about \$202 million for activities in the human sciences during the fiscal year 1972-73. This amount represents the total federal financial support of human science activities, whether carried out

within government establishments or supported in other sectors under the form of grants, contracts, scholarships or other agreements. Most of the resources, however, some 70%, are spent intramurally for activities performed by government employees. "General data collection" represents the largest activity in the human sciences supported by the federal government. Table 9.5 gives the breakdown of federal expenditures on the human sciences by category of activity and sector of performance.

Research constitutes the second most heavily supported activity with almost one third of the federal resources devoted to the human sciences in 1972-73. Research expenditures are about equally divided between intramural research and the support of research carried out in other sectors. Thirty-five different departments and agencies devote resources to research in the human sciences, 12 of them having research expenditures of over \$2 million (Table 9.6).

9.6.2 Provincial expenditures

Eight provinces have established research councils or foundations, each having the primary role of assisting firms with technical problems and of aiding the development of provincial natural resources. In 1971 these organizations spent \$15.6 million on scientific activities distributed as follows: scientific research 31%; experimental development 19%; resource surveys 12%; industrial engineering 10%; analysis and testing 8%; capital (buildings and equipment) 7%; library and technical information 6%; feasibility studies 4%; and other activities 3%.

These activities are financed largely by provincial governments (60%) but Canadian industry and the federal government are also important sources of funds (20% and 15%, respectively). The councils and foundations reported almost 800 employees at the end of 1971. There were 300 scientists and engineers and almost 270 technicians and technologists. The remaining personnel consisted of management, administrative and other support staff.

9.6.3 Industrial expenditures

In recent years industrial research and development has shown no real growth in Canada. Expenditures shown in Table 9.7 are in current dollars (a constant dollar series might show an actual decrease). In 1970, approximately 73% was company-financed, 13% federal government-financed, with the remaining funds supplied by other Canadian companies, foreign governments and firms. The funding distribution varied between industry groups: companies in the chemical-based group funded 81% of their own R&D whereas the contributions of companies in the machinery and transportation equipment group and the electrical group amounted to 61% and 65% of the respective totals. These last two groups received greater financial assistance from the federal government than did firms in other groups.

Chapter 10

Renewable resources

10.1 Forestry

The forests of Canada are largely coniferous and comprise 35% of the total land area; of this forest, 74% is suitable for regular harvest. In 1970, 4,288 million cu ft of roundwood were cut. The harvesting and processing of this timber generated work for 261,000 persons with a payment of \$1,900 million in salaries and wages. The “value added” by processing beyond the raw materials stage amounted to \$3,300 million which is 9.3% of the value added of all goods-producing industries. A detailed explanation of the value-added concept will be found in the explanatory notes of Statistics Canada’s annual Census of Manufactures.

Canada is a major exporter of forest products. Exports of wood, wood products and paper in 1970 amounted to \$2,986 million, which is 18% of the value of all commodity exports. Paper and paperboard constituted 43% of all forest products exports and newsprint alone accounted for 37%.

British Columbia, followed by Ontario and Quebec, are the most important timber-producing provinces. In 1970 British Columbia sawmills produced 68% of all lumber in Canada and most of the sulphate pulp and softwood plywood while Ontario and Quebec produced most of the groundwood pulp and hardwood plywood.

There is a growing awareness of the importance of the forest in such areas as recreation, wildlife habitat and streamflow regulation. The recognition of these values is fostering a broader and more realistic concept of forestry.

10.1.1 Forest resources

10.1.1.1 Forest regions

The forests of Canada cover a vast area in the north temperate climatic zone but wide variations in physiographic, soil and climatic conditions cause marked differences in their character; hence, eight fairly well-defined forest regions may be recognized. By far the largest of these is the Boreal Region which represents 82% of the total forested area. The Great Lakes - St. Lawrence Region covers 6.5% and the Subalpine Region 3.7%. The Montane, Coast, and Acadian Regions each account for approximately 2% while the remaining Columbia and Deciduous Regions each represent less than 1%.

Boreal Forest Region. This Region comprises the greater part of the forested area of Canada. It forms a continuous belt from Newfoundland and the Labrador coast westward to the Rocky Mountains and northwestward to Alaska. White spruce and black spruce are characteristic species; other prominent conifers are tamarack which ranges generally throughout, balsam fir and jack pine in the eastern and central portions, and alpine fir and lodgepole pine in the western and northwestern parts. Although the Boreal forests are primarily coniferous, there is a general admixture of deciduous trees such as white birch and poplar; these are important in the central and south-central portions, particularly along the edge of the prairie. In turn, the proportion of spruce and larch increases to the north and, with the more rigorous climate, the close forest gives way to an open lichen-woodland which finally changes into tundra. In the eastern section, along the southern border of the Region, there is a considerable intermixture of species from the Great Lakes - St. Lawrence forest, such as eastern white pine, red pine, yellow birch, sugar maple, black ash and eastern white cedar.

Great Lakes - St. Lawrence Forest Region. Extending inland from the edges of the Great Lakes and the St. Lawrence River lies a forest of a very mixed nature which is characterized by eastern white pine, red pine, eastern hemlock and yellow birch. With these are associated certain dominant broadleaved species common to the Deciduous Forest Region, including sugar maple, red maple, red oak, basswood and white elm. Other species with wide ranges are the eastern white cedar and largetooth aspen and, to a lesser extent, beech, white oak, butternut and white ash. Boreal species such as white spruce, black spruce, balsam fir, jack pine, poplars, and white birch are intermixed, and red spruce is abundant in certain central and eastern portions. This Region extends in a westward direction into southeastern Manitoba but does not include the area north of Lake Superior.

Subalpine Forest Region. This is a coniferous forest located on the mountain uplands of Alberta and British Columbia, from the Rocky Mountain range through the interior of British Columbia to the Pacific Coast inlets. The characteristic species are Engelmann spruce, alpine fir and lodgepole pine. There is a close relationship between the Subalpine Forest Region and the Boreal Forest Region, which also shares black spruce, white spruce and trembling aspen. There is also some penetration of interior Douglas-fir from the Montane forest, and western hemlock, western red cedar and amabilis fir from the coastal forests. Other species are western larch, whitebark pine, limber pine and, on the Coast Mountains, yellow cypress and mountain hemlock.

Montane Forest Region. The Region occupies a large part of the interior uplands of British Columbia, as well as a part of the Kootenay Valley and a small area on the east side of the Rocky Mountains. It is a northern extension of the typical forest of much of the western mountain system in the United States, and comes in contact with the Coast, Columbia, and Subalpine Forest Regions. Ponderosa pine is a characteristic species of the southern portions. Interior Douglas-fir is found throughout, but more particularly in the central and southern parts; lodgepole pine and trembling aspen are generally present, the latter being particularly well represented in the north-central portions. Engelmann spruce and alpine fir from the Subalpine Forest Region, together with white birch, are important constituents in the northern parts. White spruce, although primarily Boreal in affinity, also grows here. Extensive prairie communities of bunch-grasses and herbs are found in many of the river valleys.

Coast Forest Region. This Region is part of the Pacific Coast forest of North America. Essentially coniferous, it consists principally of western red cedar and western hemlock, with Sitka spruce abundant in the north and Douglas-fir in the south. Amabilis fir and yellow cypress are represented throughout the Region and, together with mountain hemlock and alpine fir, are common at the higher altitudes. Western white pine is found in the southern parts, while western yew is in widely scattered groups. Deciduous trees, such as black cottonwood, red alder and bigleaf maple, have a limited distribution. Arbutus and Garry oak grow only on the southeast coast of Vancouver Island, the adjacent islands and mainland. The arbutus is a broadleaved evergreen. Both are species whose centres of population lie southward in the United States.

Acadian Forest Region. Over the greater part of the Maritime Provinces there is a forest closely related to the Great Lakes - St. Lawrence forest and, to a lesser extent, to the Boreal forest. Red spruce is a characteristic though not exclusive species, and associated with it are balsam fir, yellow birch and sugar maple, with some red pine, eastern white pine, jack pine and eastern hemlock. Beech was formerly a more important forest constituent than at present, but beech bark disease has drastically reduced its representation in Nova Scotia, Prince Edward Island and southern New Brunswick. Other species of wide distribution are white spruce, black spruce, red oak, white elm, black ash, red maple, white birch, grey birch and poplars. Eastern white cedar, although present in New Brunswick, is extremely rare elsewhere and jack pine is apparently absent from the upper St. John Valley and the western half of Nova Scotia.

Columbia Forest Region. A large part of the Kootenay Valley, the upper valleys of the Thompson and Fraser Rivers and the Quesnel Lake area of British Columbia contain a coniferous forest, called the Columbia Forest Region, which closely resembles the Coast Forest Region. Western red cedar and western hemlock are the characteristic species in this interior "wet belt". Associated trees are the interior Douglas-fir which has general distribution and, in the southern parts, western white pine, western larch, grand fir and western yew. Engelmann spruce from the Subalpine Forest Region is important in the upper Fraser Valley and is found to some extent at the upper levels of the forest in the remainder of the Region. At lower elevations in the west and in parts of the Kootenay Valley, the forest merges with the Montane Forest Region and in a few places borders directly on grassland.

Deciduous Forest Region. A small portion of the deciduous forest, which is widespread in the United States, extends into southwestern Ontario between Lakes Huron, Erie and Ontario. Here, with the deciduous trees common to the Great Lakes - St. Lawrence Forest Region, such as sugar maple, beech, white elm, basswood, red ash, white oak and butternut, are scattered a number of other deciduous species which have their northern limits in this locality. Among these are the tulip-tree, cucumber-tree, pawpaw, red mulberry, Kentucky coffee-tree, redbud,

black gum, blue ash, sassafras, mockernut hickory, pignut hickory, black oak and pin oak. In addition, black walnut, sycamore and swamp white oak are confined largely to this Region. Conifers are few but there is scattered distribution of eastern white pine, tamarack, eastern red cedar and eastern hemlock.

The Grasslands. Although not a forest region, the prairies of Manitoba, Saskatchewan and Alberta support several species of trees in great numbers. Trembling aspen forms groves or “bluffs” around wet depressions, and continuous dense stands along the northern boundary. Several other species of poplar are usually found along rivers and in moist locations, along with willows and some white spruce. There are sporadic stands of white birch, Manitoba maple, bur oak and ash. In British Columbia, where the grasslands are confined to deep valleys and low areas of the interior, there are scattered representations of ponderosa pine, birches, poplars, spruce and mountain alder.

10.1.1.2 Forest land

Inventories of the forest resources of Canada are made periodically by provincial forest authorities and, with their co-operation, the Canadian Forestry Service of the Department of the Environment compiles national statistics.

The 1968 National Forest Inventory reported an area of 1,244,291 sq miles of forest land (Table 10.1). Of this total, 26,616 sq miles are reserved by legislation for primary uses other than timber production. The remainder is divided into two categories — 919,208 sq miles suitable for regular harvest and 298,467 sq miles which cannot be harvested regularly because of slow regeneration and growth. Nevertheless, this second category is capable of producing trees of merchantable size and, as inventories are extended and refined, its area can be expected to increase. Currently, only 65% of the forest land of Canada has been inventoried in the sense of gathering statistically reliable information on area and forest cover.

Provincial Crown forest land constituted 69% of the non-reserved forest land of Canada, leaving 23% under federal jurisdiction and 8% in private ownership. Of the provincial forest land 69% is allocated to timber production and of the federal forest land less than 2% is so allocated. Although precise use of private forest land is a matter of speculation, individual studies and limited statistics suggest that timber production still predominates despite a tendency to convert some of this land to recreational use. At the time of the 1968 inventory 10% of the non-reserved forest land was considered inadequately stocked for timber production.

The estimates of volumes of timber, which are given by province in Table 10.1, are also subject to constant revision as more accurate and complete inventories are compiled. The volumes reported in the 1968 National Forest Inventory are smaller than those reported previously despite more extensive inventory coverage. This is the result of two factors — first, the 1963 inventory, which was the basis for previously presented information, provided rough estimates of timber volumes in Labrador and in the Yukon Territory and Northwest Territories but, in the absence of reliable data, these areas were not covered in the 1968 inventory; secondly, British Columbia adopted procedures whereby data on volume of mature timber only were compiled.

10.1.1.3 Canada's forest trees

There are approximately 140 recognized tree species in Canada, excluding the various subspecies and varieties. Of this number, 31 species are conifers or ‘softwood’, about two thirds of which are of commercial value; less than one fifth of the native broadleaved trees or ‘hardwoods’ can be considered as commercially significant.

The most abundant forest trees in Canada, in terms of standing timber, are the spruces, pines, true firs, poplars, hemlocks, birches, cedars, Douglas-fir, maples and larches. However, the economic importance of these species, except for the spruces, does not necessarily correspond to their abundance.

About one third of Canada's timber volume is spruce. White spruce and black spruce range from the Atlantic Coast almost to the Pacific and northward into Alaska. Sitka spruce, the largest of the native spruces, is found in the Pacific Coast area; Engelmann spruce is established farther inland, extending to the foothills of the Rockies in southwestern Alberta; and red spruce is found only in eastern Canada. Spruce is used extensively for pulpwood, lumber and plywood.

Among the pines, two species — jack pine and lodgepole pine — comprise 11% of Canada's standing timber. Jack pine grows from Nova Scotia to northern Alberta and the Northwest

Territories and lodgepole pine is found in western Alberta, British Columbia and Yukon Territory. Eastern white pine, which grows from the Atlantic to the eastern edge of the prairies, and western white pine produce valuable softwood lumber. Ponderosa pine, found in the drier areas of southern British Columbia, and red pine, found in eastern Canada, are important commercial species.

The four native firs are all commercial species, although balsam fir far outranks the other species in this regard. It is the only fir found in eastern Canada and ranges from Newfoundland through all the provinces except British Columbia. Alpine fir, essentially a high altitude tree, is found over a wide area in British Columbia and its range extends well into the western half of central Alberta and the Yukon. Amabilis fir is a west coast species, while grand fir is found in both the Pacific coastal areas and the interior of British Columbia. Fir is commonly cut as pulpwood and, to a lesser extent, as sawlogs.

Douglas-fir, one of Canada's best known commercial trees, is not a true fir. The tree responsible more than any other for British Columbia's world-wide reputation for timber is the coastal form of Douglas-fir which is dominant in the forests of the province's lower coastal areas. An interior form, known as blue Douglas-fir, is used on a large scale for lumber, plywood, construction timbers, piling and kraft pulp.

The poplars are the most abundant of the native broadleaved trees. They include trembling and largetooth aspen, balsam poplar, and the three cottonwoods. The most widely distributed is trembling aspen, followed by balsam poplar; both species occur from Newfoundland to Alaska. The largest of the native poplars is black cottonwood; its range covers the lower two thirds of British Columbia and extends well into Alberta to the east in a pattern that follows the natural drainage basins. It also reaches as far north as the Yukon along the coast. This species is in demand for veneer stock. Other cottonwoods — eastern cottonwood and its western form known as plains cottonwood, and narrowleaf cottonwood — have a much narrower distribution.

Hemlocks, ranking fifth in volume of standing timber, have considerable commercial importance. Western hemlock grows plentifully along the Pacific Coast and west of the Rockies in the interior wet belt of British Columbia. It is one of the principal timber-producing species in western Canada and is also an important source of pulpwood. Eastern hemlock is found from the Atlantic to western Ontario, although not in a wide or continuous pattern. It is used to produce a number of products including pulpwood, plywood and lumber. Mountain hemlock is found in British Columbia in parts of the coastal forest and in the heavier rainfall areas of the interior.

Of the six native birches, only two are of commercial importance — yellow birch and white birch. Most abundant is white birch which grows over a vast part of Canada from the Atlantic to the Pacific and extends up to the northern tree limit. One variety, western paper birch, reaches heights of 100 feet and diameters of three feet or more. Yellow birch is a valuable hardwood species used extensively for flooring, veneer and plywood. Its range extends from the Atlantic to Lake Superior.

The native trees commonly known as 'cedars' include the arbor-vitae (eastern white cedar and western red cedar), yellow cypress (yellow cedar) and a juniper (eastern red cedar). Together they make up an important group of commercial species. Eastern white cedar is found from Nova Scotia to Manitoba and as far north as James Bay in Quebec and Ontario. Its wood, which is light and resistant to decay, is used for posts, poles, boats and other purposes where timber is exposed to situations favourable to decay. Western red cedar is of major importance in British Columbia where it ranges from the Pacific Coast to the Rocky Mountains. It is used for lumber, exterior siding, shingles, poles and posts, doors, window sashes and other purposes where resistance to decay is required. Yellow cypress — commonly called yellow cedar or Alaska cedar — is found mainly in the Pacific Coast region where it grows down to sea level in the more northerly sections. As it extends farther south, it seeks higher elevations. Its wood, like that of the other cedars, is valued in situations where resistance to decay is needed.

There are ten native species of maple, six of which are of commercial value. Only two species are known as hard maples, producing wood that is both hard and strong — sugar maple and the closely related black maple. Sugar maple ranges from the Atlantic to Lake Superior, while black maple is found mainly in southern Ontario. Hard maple constitutes one of the most valuable commercial hardwoods in Canada. It is used for furniture, flooring, veneer, quality plywood, turnery and other specialized purposes where strength and hardness are needed. Sugar maple and, to a lesser degree, black maple are tapped for the maple sugar industry. Bigleaf maple is found on the lower Pacific Coast mainland and on Vancouver Island. The wood is only moderately hard and lacks strength but, owing to the limited local supply of hardwoods, this tree is of some importance for furniture and other specialized uses in the immediate area. Red maple and silver maple are eastern species. Red maple ranges from Newfoundland to western Ontario, while silver maple is concentrated mainly in southern Ontario and southwestern Quebec. Their wood is weaker and softer than that of the hard maples and these trees are not important timber producers. The Manitoba maple, ranging from Ontario across the southern parts of Manitoba, Saskatchewan and southeastern Alberta, produces a soft, moderately light wood that is low in strength. It is better known as a shelterbelt tree.

There are three species of larch in Canada. Two of them — eastern larch, better known as tamarack, and western larch — have commercial value. Tamarack is widely distributed from Newfoundland to the British Columbia - Yukon border and reaches far into the Northwest Territories. The wood is used for poles, posts, piling, boxes, crates and pulp. Western larch, found mainly in southeastern British Columbia, is one of the important timber-producing trees of western Canada. The wood, being hard and strong, is used mainly in construction but is also made into flooring, interior and exterior furnishings, and pulp.

Other trees of less commercial significance include oak, ash, beech, elm and basswood. Valuable as the wood of these species may be, it is usually obtainable in limited quantities only. However, the species may have considerable local importance and they also contribute greatly to the forest landscape.

Canada's better known species are the commercially exploited trees, but in the forest all species have a role to play in maintaining the ecological balance, controlling water run-off and preventing soil erosion, and also in providing a habitat for native fauna and recreational facilities for all who wish to enjoy them.

10.1.2 Forest depletion

The average annual forest depletion by cutting and fire is shown in Table 10.2 for the ten-year period 1960-69. The primary sources of Canada's current wood production are the areas of Crown forest land allocated to wood production and private forest land. These two ownerships constitute 434.8 million acres and, of that area, 1.8 million acres (based on 1968 information), or less than one fifth of 1%, were cut annually over the period shown and 593,000 acres, or about one tenth of 1%, were burned. On a volume basis, the average annual depletion from cutting was 3,649 MM cu ft, which may be compared with an estimated permissible cut on a sustained-yield basis of 8,481 MM cu ft from approximately the same areas of Crown and private land. In addition to cutting and fire, extensive forest depletion is caused by insects, diseases and natural mortality but no reliable estimates of these losses, either physical or economic, are available.

In aggregate, a large surplus of timber exists in Canada although there are shortages in some regions and shortages in some species which could be overcome by increased silvicultural and management inputs where such are considered to be economic. Also, greater utilization of individual trees and certain species could further extend the resource.

An unprecedented 9,253 forest fires burned a total of 2.6 million acres of valuable forest land across Canada in 1970 (Table 10.3). Despite the exceptionally heavy fire load, fire control organizations were successful in holding the acreage burned to a level only slightly above the corresponding ten-year average. Furthermore, the \$11.4 million in estimated fire damages compares favourably with the \$16.3 million average annual losses reported over the previous decade.

Through carelessness and incendiarism, man has been blamed for 64% of all forest fires reported in 1970 (Table 10.4). Lightning accounted for 3,299 fires or 36% of the annual total. This represents the highest percentage of lightning fires ever recorded in Canada.

10.1.3 Forest administration

10.1.3.1 Federal forestry programs

The federal government is directly responsible through several departments and agencies for the protection and administration of forest resources in the Yukon Territory and Northwest Territories and on other federal lands such as the national parks, Indian reserves, military areas, and forest experiment stations. In addition, there are important federal responsibilities with respect to the nation's forest resources as a whole. These responsibilities, which relate to forestry research and development and the provision of information and technical services, are defined and established by the Forestry Development and Research Act (1966) and the Department of the Environment Act (1970).

The primary federal organization concerned with forestry is the Canadian Forestry Service of the Department of the Environment. Heading this Service is a director-general who is responsible to an Assistant Deputy Minister of the Department. Reporting to the director-general are branch directors for program development, program operations, and forestry relations. The three directors are concerned respectively with: guiding and evaluating the long-term development of the Service's program; organizing, co-ordinating, and managing the annual research and services program; and with planning, co-ordinating, and directing the external and international program of forestry relations. Also responsible to the director-general is the head of the Forestry Information Section and an administrative officer in charge of the Administrative Services Section.

The program of the Canadian Forestry Service falls within six categories: forest resource research, development and services; forest products research, development and services; technical information and advisory services; public information; aid to universities; and special assignments.

Departmental programs in forestry research and development are described in Chapter 9, Section 9.2.4.

To promote improved management of forest resources and better forest products, the Canadian Forestry Service, through publications, workshops, seminars, etc., disseminates technical information to forest resource and wood processing managers. Forest advisory services are provided for federal departments and international agencies, and assessments are also made of operational trials and treatments conducted by resource organizations and

industry. In the forest products field, special testing services (unavailable commercially) are provided both for government and industry. The Service also participates in the development of codes and specifications for forest products.

Through its publications, press releases, films, displays and demonstration areas, the Service seeks to increase public awareness and understanding of forest values and to enlist support in the protection and wise use of the forest resource.

10.1.3.2 Provincial forestry programs

All forest land in provincial territory, with the exception of the minor portions in national parks, federal forest experiment stations, military areas and Indian reserves, is administered by the respective provincial governments. The forestry program of each province is outlined below.

Newfoundland. The forest resources of this province are geographically separated by the Strait of Belle Isle into two distinct regions — the island of Newfoundland and Labrador on the mainland.

The forest resources of Labrador are not fully known and are only now subject to a forest inventory which will not be completed for a few years. Previous estimates show that, of a total area of 112,826 sq miles in Labrador, approximately 21,000 sq miles are considered productive forest land. The total volume of wood in Labrador has been estimated at 60 to 70 million cords of black spruce and balsam fir.

A forest inventory has recently been completed for the island of Newfoundland. Of a total area of 43,359 sq miles, over 14,000 sq miles are classified as productive forest. This area supports a total gross volume of 99.5 million cunits of softwoods and hardwoods. The principal commercial species of trees are black spruce and balsam fir. White pine, white spruce, and white and yellow birch are of lesser commercial importance.

Forty-nine percent of the productive forest lands on the island has been leased to the pulp and paper industry while 37% remains under the direct jurisdiction of the Provincial Forest Service. Tenure of the remaining 14% is varied and includes federal and provincial parks, areas held under fee simple grants and municipal ownership.

The management and protection of the unoccupied Crown lands is the responsibility of the Provincial Forest Service which employs professional foresters and trained forest technicians to carry out a management program of forest inventory surveys, silvicultural programs in thinning, fertilization and reforestation, and access road construction to permit harvesting of mature and overmature timber. The fire protection division has rapidly expanded over the past decade; during the fire season more than 100 trained personnel are supported by an aircraft fleet of five Canso water-bombers, four helicopters, and three fixed-wing transport and spotter planes.

Administratively, the province is divided into four forest regions with headquarters in St. John's, Gander, Corner Brook and Goose Bay, each controlled by a regional forester who directs the activities of five district offices. Communications between field offices and headquarters are dependent upon telephone, radiotelephone, and telex installation. In recent years the network of fire towers is being phased out in favour of aerial patrols.

The forest industry in the province consists of two pulp and paper mills located at Grand Falls and Corner Brook, a liner board mill at Stephenville, and a particle board plant at St. John's. In recent years the sawmill industry has shown signs of expansion but it still falls short of satisfying provincial lumber consumption. The total forest industry is estimated to contribute approximately \$150 million annually to the gross provincial product.

Forest research is principally carried out by the Canadian Forestry Service, a Branch of the federal Department of the Environment.

Post high school education in forestry is available at Memorial University of Newfoundland and at the College of Trades and Technology (CTT). Memorial University offers a two-year diploma course in forestry and is affiliated with the forestry faculty of the University of New Brunswick. At the CTT students may obtain a diploma after successfully completing a two-year forest technology course.

Prince Edward Island. Roughly one third of Prince Edward Island's 2,184 sq miles of land is tree-covered. The wooded areas consist of scattered patches throughout the province with the greatest concentration in the eastern section. All of the woodland is privately owned except some nine sq miles of provincial forested Crown land.

The Forestry Branch of the Department of Agriculture administers all forestry matters in the province — reforestation, protection and woodlot improvement. The reforestation program has been increasing year by year, as many as one million trees being planted in one year on provincially owned and privately owned land. The Forest Nursery is being expanded and by 1975 will provide some 6 million trees annually.

The forest management programs include the provision of access roads into Crown land areas and woodlot improvement; improvement cuts act as demonstration areas for the public and for 4-H Forestry Clubs and Boy Scout and Girl Guide groups. Fire protection is not too serious a problem in this province as wooded areas are relatively small and scattered and are all accessible by road so that equipment can be rushed to the scene of a fire quickly and easily.

Nova Scotia. Of Nova Scotia's land area of 20,402 sq miles, 15,555 sq miles are classed as forested and most of the forested land is considered suitable for regular harvesting. Although 91% of the forest land in Canada is held by the Crown in the right of the federal and provincial governments, only 22% is so held in Nova Scotia.

Provincial Crown lands are administered by the Department of Lands and Forests through a staff of foresters and rangers. Extension personnel assist owners of small private woodlands. The Department administers the Lands and Forests Act as it pertains to all lands, and is responsible for forest fire suppression. Forest fire detection is facilitated through 35 observation towers and a six-plane aerial patrol service. In 1972, 568 fires burned 5,882 acres of forest. Ten fires exceeded 50 acres, and the largest covered 1,590 acres. Fire suppression crews and rangers with equipment are stationed throughout the province.

The forest industry is of prime importance to the economy of Nova Scotia, contributing directly or indirectly more than \$100 million to the gross provincial product annually. There are in operation some 350 sawmills of various types and sizes, one hardboard mill, two newsprint mills, one groundwood pulp mill, and one chemical pulp mill. These mills accounted for 151,000 Mfbm of sawn materials and consumed 937,000 cords of pulpwood in 1971, excluding 106,500 cords-equivalent of pulp chips from sawmill residues. In addition, 45,000 cords of pulpwood were exported and 6,800 cords of pit props, poles and pilings were produced.

The reforestation program, active since the 1930s, is being expanded as quickly as funds and staff permit. Experimental work on container planting, direct seeding, soil capability and site preparation continues. Efforts are being made to improve seed sources. Total softwood inventory as at July 1972 was 6.9 million seedlings and transplants.

Timber, pulpwood and Christmas trees are sold through public tender, and cutting on Crown lands is done under recommendation of resource managers of the Department of Lands and Forests. Management cruises, regeneration studies and experimental cuttings are conducted on Crown lands, and a program of operating these lands under long-term, integrated use management plans is under way. During 1971-72, 2,609 acres of Crown forest were thinned and improved, bringing the total acreage of Crown silvicultural treatments to 31,600 since 1965.

A provincial forest inventory, a continuous system designed to operate on a seven-year cycle, was in its second-to-last year in 1972 and plans were being made for the second inventory cycle. This will cover the province in ten years. The forest capability survey of the Canada Land Inventory was completed in 1971. Other forest capability studies are directed at yields, tree-breeding, and fertilization. A system of 1,750 permanent sample plots was completed to provide continuing data on growth and drainage. Aerial colour photography, begun on Cape Breton Island in 1969, is being extended to the remainder of the province.

Forest research is carried on by federal government agencies and by the Nova Scotia Research Foundation. Investigations cover stand improvement, tree nutrition, cutting methods, and insect and disease activities. Extension projects include fire prevention, a province-wide motion picture program, distribution of information on forest and wildlife conservation, promotion of the Christmas tree industry, a hunter safety program, woodlot improvement, preparation of material for the mass media, and technical assistance to sawmill operators.

New Brunswick. Of the total land area of New Brunswick (27,835 sq miles), approximately 87% is classed as forest land suitable for regular harvest of which the Crown, in right of the province, owns about 46%. About 2% is owned by the federal government and the remainder is

privately owned. The total volume of standing timber in the province is estimated at 20,400 MM cu ft; coniferous species make up 70% and deciduous species the remainder.

Protection from forest fires, the first requirement for forest conservation, is mainly the responsibility of the Department of Natural Resources which also carries out duties in connection with game management and protection, mines, water, and the administration of provincial Crown lands. A large-scale aerial spraying program to protect balsam fir and spruce from the spruce budworm has been carried on since 1952 by a Crown company sponsored by the federal and provincial governments and by representatives of the forest products industries. Forest management licences authorize operators to cut and remove forest products in accordance with forest management plans and cutting permits. Royalty is paid to the province when products are cut by the licensees.

New Brunswick does not maintain a forest research organization but co-operates with the Canadian Forestry Service in that field. The University of New Brunswick has also undertaken a small number of forest research projects in co-operation with the National Research Council, the provincial government and other interested organizations.

In the field of education, the University of New Brunswick offers undergraduate and graduate courses in forestry leading to BScF and MScF degrees. It is also responsible for the administration of the Maritime Forest Ranger School in conjunction with the governments of New Brunswick and Nova Scotia and with private industry. The forest extension services of the University assist both government and private agencies in the direction and planning of various forestry extension programs. The provincial Department of Agriculture and Rural Development also provides an expanding extension service to the owners of farm woodlots.

Quebec. Forests with economic potential cover 298,000 sq miles, about 50% of the total area of the province. This forest-cover stretches northward to an irregular line near 52°N on the east and 54°N on the west of the province.

These forests may be divided into two separate tenure groups — private forests and public forests. Private forests cover an area of 27,900 sq miles. Public forests cover 270,300 sq miles of which 180,200 sq miles are under management; of the remaining 90,000 sq miles, 31,600 sq miles are considered highly productive although still inaccessible. Public forests carry a volume of almost 93,900 million cu ft of standing timber of various species; private forests contain 16,600 million cu ft. Coniferous species make up 78% of the total volume. Public forests under management and private forests supply the pulp and paper mills and the sawmills of Quebec. Private forests account for about 25% of the annual cut (about four million cunits). Quebec forests account for approximately 25% of the gross provincial product.

Management of public forests and assistance to private forestry is carried out by the Forestry Branch of the Department of Lands and Forests which controls development and the use of woodlands, and undertakes conservation measures. Principal management controls are: the annual inventory of some 30,000 sq miles of forest land; study and regulation of silvicultural practices for this area and the zoning of the land for its best use; and restoration of lands destined for forestation by replanting or by proper treatment — to achieve this Quebec maintains some 100 million plants in nursery stock. Regulations governing the use of the forests cover operational control, the issuance of permits for establishment of mills and cutting permits, measurement of wood harvested on Crown land, aid to development of private forests, and building and maintenance of forest roads. Through regional conservation groups, this branch is responsible for forest protection against insects, fire and fungus attack.

Ontario. Forested land in Ontario amounts to 188,334 sq miles, of which 180,588 sq miles are classified as forest land bearing or capable of bearing timber of a commercial character suitable for regular harvest and not withdrawn from such use. About 90% of this forest land is owned by the Crown, administered and managed by the Ontario Ministry of Natural Resources.

The Ministry of Natural Resources came into being April 1, 1972 as a result of a major restructuring of the government of Ontario. The goal of the Ministry is separated into three programs: Land Management, Outdoor Recreation and Resource Products.

Principal Divisions with their constituent Branches are: Forests (Forest Research, Forest Management, and Timber Sales); Mines (Geological, Mineral Research, Mineral Resources, Mines Engineering); Fish and Wildlife (Commercial Fish and Fur, Fish and Wildlife Research, Sport Fisheries, and Wildlife); Parks (Historical Sites, Park Management, Park

Planning); Finance and Administration (Administrative Services, Financial Management, Information, Legal Services, Northern Affairs, and Personnel); Lands (Lands Administration, Land Use Co-ordination, and Surveys and Mapping); Field Services (Air Service, Forest Fire Control and Engineering Services). There is also a Conservation Authorities Branch and a Policy Research Branch.

One of the objectives of the new organization is to serve the public more effectively through decentralization to regional and local levels. Four groups are established within the Ministry: Resources and Recreation; Lands and Waters; Northern Ontario; and Southern Ontario. The first two groups are primarily concerned with policy development while the others are primarily concerned with policy implementation.

The Forest Management Branch is responsible for the regeneration, tending and improvement of the forests on Crown lands, Agreement Forests and private land under the Woodlands Improvement Act. In addition, the Branch has the important task of promoting forestry on privately owned lands through its extension program.

The Branch operates ten forest tree nurseries (with supporting tree seed collection, treatment and storage plant) with a current production target of about 80.5 million trees. Complementing this are up-to-date tree improvement and nursery soil management programs. The Branch, directly or indirectly, supervises all planting projects on Crown lands but regeneration agreements have been signed with all major licensees under which the latter assume responsibility for planting projects and are paid at an agreed rate for work completed. Other work, such as site preparation for planting, may be performed by the companies under the same agreement.

During 1971, 60.5 million nursery-produced trees were planted on about 80,300 acres of Crown and Agreement lands, and 9.9 million tubed seedlings were planted on about 9,950 acres. Other silvicultural treatments included the direct seeding of 22,200 acres, treatment for natural regeneration on 57,250 acres and stand improvement (cleaning, spraying, thinning, pruning, etc.) on 88,100 acres. In all, 257,800 acres of Crown and Agreement lands were silviculturally treated in 1971 to promote regeneration or to improve the forests.

Owners of private land may purchase planting stock for forestry purposes from government nurseries at nominal prices and may also receive free professional advice on any forestry matter, including silviculture, harvesting and marketing. In 1971 (spring and fall), planting stock furnished for private lands totalled 15.7 million units. Under the Woodlands Improvement Act, it is possible to have planting and improvement work carried out completely under government direction and mainly at public expense. Since its inception in 1966, the program has provided assistance for 128,700 acres (as at April 1, 1972) of privately owned land.

For half a century, Ontario has had enabling legislation that permits municipalities and, within the past 20 years, conservation authorities to place abandoned and submarginal agricultural lands to which they have acquired title under agreement with the Ministry, which undertakes to plant and manage the properties for a specified period of between 20 and 50 years. Nearly 245,000 acres under such agreements are managed intensively and the older plantations are receiving regular thinnings. The trees removed are in demand for pulpwood, posts, poles and sawlogs, making the undertakings financially attractive. In addition, properties close to centres of population have acquired tremendous value as recreational areas.

The Timber Sales Branch co-ordinates and supervises preparation of management plans for Crown management units and approves the plans prepared for company management units. Forest inventory requirements and priorities for such plans are determined by the Branch. As at March 31, 1972, 203 plans (86 Crown units, 57 company units and 60 Agreement forests) were completed or in process of completion for approximately 190,900 sq miles. Forest access is most important in the implementation of management plans and the forest access roads program is part of the Branch's responsibilities.

The Branch arranges for the orderly sale and disposition of timber and the measurement (scale) of the products removed. Sawmills are licensed and directories prepared. Information is collected and analyzed on the production, transportation and marketing of timber and the data provided to the forest industry.

The Forest Fire Control Branch is responsible for the area under organized forest protection in Ontario totalling 180,275 sq miles and including the main central band of accessible forests. This area is organized into 20 fire districts and subdivided into 50 chief

ranger divisions. South of this area, in the highly developed agricultural counties, municipalities are responsible for fire control. The vast inaccessible areas to the north of the fire districts, totalling over 134,000 sq miles, do not support significant stands of merchantable timber and, except for communities or other special values, are not protected. Within the fire districts, agreements were in effect in 1970 with 200 municipalities for the prevention and control of forest fires. An agreement was also in effect with the federal government for fire protection of 958,000 acres of Indian lands in the province.

Organized forest fire detection is accomplished by aerial patrol or combined aerial patrol and lookout tower systems, although towers are quickly being phased out in favour of aircraft. Public reporting of forest fires (unorganized detection) continues to be an important and very necessary part of the over-all detection program. The basic fire-fighting strike force comprised 135 trained, five-man fire crews and 42 fire-bombing aircraft. These forces, with the aid of timber operators, municipal fire brigades and the general public in some instances, provided the initial attack on the 1,604 fires that occurred in 1972.

Fire-bombing aircraft provided initial attack on 283 fires. Those aircraft dropped 130,938 gallons of water and long-term retardant which has proven to be an effective operational tool. Avengers and a Tracker provided the main long-term retardant delivery system. Water-based aircraft can also deliver long-term retardant in Ontario. Prescribed burning as a silvicultural and hazard reduction tool was continued in 1972 with five burns covering 2,455 acres.

An integral float tank water-bombing system is installed on float-equipped aircraft. The aircraft fleet, as at January 1, 1973 comprised 25 Turbo Beavers, ten Otters, Three Twin Otters, one Beechcraft Duke and one Beechcraft KingAir 100; six Grumman G-89 Tracker air tankers; one Jet Ranger, one Hughes 500 and one G-4-A helicopter were leased for the fire season. Five more G-4-A helicopters were available to the Ministry as required. The communications system included 186 ground stations, 277 lookout tower radios, 20 patrol vessel radiotelephones, 674 mobile radiotelephones, 1,344 portable fireline radios, 41 aircraft radio installations and 74 portable aircraft radiotelephones.

Forest pest problems in 1971 were again dominated by the spruce budworm which infested over 13 million acres but spraying operations to control this insect were limited to 80,000 acres, in four separate high-value local areas. Smaller acreages on Crown owned and Crown managed areas totalling 15,000 acres were also treated for white pine weevil, pine and spruce sawflies, white grubs, white pine blister rust, annosus root rot, and mice.

Manitoba. The administration of provincial Crown forest lands in Manitoba is the responsibility of the Department of Mines, Resources and Environmental Management which consists of a Resources Management Division, a Mines and Departmental Services Division, an Environmental Management Division and a Water Resources Division. A special planning section is charged with developing short- and long-range forestry plans and programs relating to the forest inventory, timber utilization and industrial development, reforestation, silviculture and forest protection.

The Research Branch of the Environmental Management Division undertakes the necessary practical research for the qualitative development of these programs and the various projects and activities within them. The Branch co-operates with several federal services which maintain two research areas in the province and works closely with federal authorities in investigating and controlling forest damage resulting from insects and diseases.

The Resources Management Division is charged with the administration of the Forest Act and Regulations, and the implementation of forestry programs and projects developed. It also provides considerable input with respect to plans developed for specific areas within the four regions into which the province is divided, each headed by a regional director responsible for the field administration of the forests and other resources in the region. Policy guidelines are established by head office which co-ordinates control measures for the propagation, improvement and management of the forests, for the harvest of forest products, and for forest inventory surveys. A provincial forest nursery is maintained to supply stock for reforestation of denuded Crown land and some natural seed areas have been established for nursery stock. Seedlings are supplied to farmers for woodlots and to commercial Christmas tree producers; an average of more than 4 million are planted each year in reforestation projects on Crown lands. Conventional planting programs are being reduced and reforestation of cutover lands is being achieved by scarification and seeding. The program of forest stand improvement comprises thinning, clearing and chemical spraying to remove undesirable species and

encourage growth of preferred trees. Forest inventories cover about 10,350 sq miles annually and, on the basis of these inventories, working plans with annual allowable cuts on a management unit basis are in operation.

Timber-cutting rights are awarded by forest management licences, timber sales and, in certain cases (particularly for salvage operations), by timber permits. Forest management licences may be granted for periods of up to 20 years and are renewable; timber sales may be for varying periods from one year upward and timber permits for periods of up to one year. In 1972, one long-term pulpwood berth with an area of 2,745 sq miles was in force together with four long-term timber berths, all granted prior to 1930. A second long-term pulpwood berth agreement was signed in 1966, covering the construction of a pulpmill and sawmill at The Pas in northern Manitoba.

There are 128,370 sq miles of the province under forest care protection, with zones of priority established in the less accessible areas. Fires are detected through a comprehensive network of lookout towers and supporting air and ground patrols, all in communication by radio and departmental or public telephones. Seven twin engine and one single engine aircraft supplement the tower fire detection system. Approximately 90,000 sq miles are covered by these aircraft. Two Canso water-bombers and three helicopters, two Turbo Beavers and two single engine Otter aircraft are contracted for the fire season to provide an aerial fire suppression force.

Public education in the fields of fire prevention and forest conservation is carried out through extensive use of radio, television, newspapers, pamphlets, signs, film tours and talks.

The Mines and Departmental Services Division provides accounting and clerical services for the other two divisions, and is responsible for issuing permits, licences and leases relative to forestry projects and activities.

Saskatchewan. The forests of Saskatchewan cover 117,738 sq miles of which 40,500 sq miles are productive forest land and 38,206 sq miles are suitable for regular harvest. Provincial forests constitute approximately 92% of all forest land in the province and are managed and developed by the Forestry Branch of the Department of Natural Resources.

The Forestry Branch, consisting of three sections — forest management, inventory and silviculture — develops and evaluates forest policies and management programs which are carried out by the various regional administrative authorities. For purposes of resource administration, the province is divided into six regions, each directed by a superintendent. The regions are subdivided into conservation officer districts which vary in size according to resource base and population to be served. Close liaison is maintained between the Forestry Branch and the various regional authorities.

Development of techniques in prevention, detection and suppression of forest fires is a function of the Support Services Branch, which is composed of three sections — fire control, heavy equipment and communications. A network of 75 lookout towers equipped with two-way radios is maintained throughout the province and is supplemented by aircraft on regular patrol duty during high-hazard periods. The Department of Natural Resources communication system is being converted to VHF. Approximately 1,400 two-way radio sets, operated in towers, vehicles, aircraft and bush camps, are used for the detection and suppression of forest fires; six helicopters and eight fixed-wing aircraft capable of water-dropping provide aerial support. Outside help may be requested when available and necessary.

Alberta. The 148,167 sq miles of forest lands in Alberta include 106,755 sq miles which are considered productive. The Alberta Forest Service of the Department of Lands and Forests through its six Branches (Administration, Timber Management, Forest Protection, Construction and Maintenance, Land Use and Training) is responsible for their administration. Jurisdiction is decentralized into ten Forests, each responsible for the forest area within its boundaries. Each Forest is under the control of a superintendent, supported by specialists in the fields of timber management, fire, land use, construction and communications, as well as by other clerical and casual staff. These Forests are further subdivided into Ranger Districts under a district forest officer responsible to the superintendent. District officers may have several assistant rangers, in addition to other staff, under their charge.

The Timber Management Branch is responsible for implementation and supervision of the timber quota system, acceptance and approval of management and annual operating plans

prepared for leased and licensed Crown lands, preparation and execution of forest management plans, and disposal of Crown timber. The Branch also carries on silvicultural programs, processes applications, takes inventories of forest resources, inspects cutting areas to ensure proper logging and utilization practices, and collects dues and fees.

The Forest Protection Branch is in charge of all phases of protection including prevention, detection and suppression of wild fires. This Branch includes a number of specialists such as a meteorologist, a telecommunications officer and an Aircraft Dispatch Section to assist in the over-all protection program.

The Construction and Maintenance Branch constructs and maintains all road, airstrip and building facilities within the area of the Service's jurisdiction and administers and operates three licensed public airports.

The Forest Land Use Branch is responsible for the planning and supervision of proper land-use practices in the forested area, including grazing, recreation and watershed management, particularly on the east slopes of the Rocky Mountains containing the North and South Saskatchewan rivers. The Forestry Training Branch provides facilities and instructions for the second year of a two-year forest technology course given by the Northern Alberta Institute of Technology. It also conducts in-service training programs for all the Branches in the Forest Service and other divisions of the Department.

Basic research in all phases of the forestry program is generally carried out by the Canadian Forestry Service. A new federal research laboratory has been completed in Edmonton to improve the research service that is provided.

British Columbia. Of the 366,255 sq miles in British Columbia somewhat over 215,744 sq miles are inventoried as forest land. This includes 276,068 MM cu ft of mature merchantable timber, most of it coniferous species.

For administrative purposes, the province is divided into six Forest Districts with regional headquarters at Vancouver, Prince Rupert, Prince George, Kamloops, Williams Lake, and Nelson. Further decentralization of authority is effected by subdivision into Ranger Districts, of which there are 101 throughout the province. Ten directional, servicing or policy-forming Divisions constitute the head office of the Forest Service at Victoria.

Efforts continue to bring British Columbia's forest resources under sustained-yield management and the forest industries are making progress toward more complete utilization of their raw materials. The problem is urgent despite the fact that, with a present annual scale of approximately 1,997 MM cu ft (1971), the total inventory would appear sufficient to support current needs in perpetuity. One of the more spectacular results of sustained-yield administration has been the swinging of a greater proportion of the annual forest harvest to the interior of the province. In 1971, the wet belt forests on the coast accounted for about 50.1% of the total forest cut and the interior for 49.9%. For all practical purposes, the entire interior forest is publicly owned; a large proportion of the privately owned, leased or licensed forests are on the coast.

Several systems of timber disposal are in effect. The Tree Farm Licence is a contract between the government and a company or individual whereby the latter agrees to manage, protect and harvest an area of forest land, including any privately held forest land, on a sustained-yield basis. Tree Farm Licences are subject to re-examination for renewal every 21 years. Public Sustained-Yield Units are areas within which the Forest Service manages the Crown timber on a sustained-yield basis. Within the Public Sustained-Yield Units, recognized established logging operators can apply for Timber Sale Licences or Timber Sale Harvesting Licences which entitle them to log at a given rate per year, based on a number of factors including the operator's average rate of production at the time the unit was established.

Forest fire prevention techniques and organization for effective forest fire suppression are vital aspects of planned sustained-yield management. Extensive use is made of aircraft under various terms of contract. Air tankers and fire-spotter aircraft are employed during the fire season and helicopters and other aircraft are employed under contract for patrol duties and for the transport of fire suppression crews. The rugged topography and the many remote and sparsely populated areas of the province demand the availability of a variety of transportation methods to achieve early discovery of and attack on forest fires.

Close liaison with the Forest Branch of the federal Department of the Environment through facilities at Victoria provides detailed information on insect and fungal enemies of the forest and on fire research.

10.1.4 Statistics of forest industries

This Section is concerned with the many industries engaged in the felling of timber and its transformation into a variety of products required in modern living. The extensive forests of Canada provide raw materials for several large and growing primary industries: sawmills and planing mills, shingle mills, veneer and plywood mills, particle board plants and pulp and paper mills, which in their turn provide raw materials for a wide range of secondary industries that convert the products of the primary industries into more highly manufactured goods such as sash, doors, millwork, wooden boxes, furniture, converted papers and paper goods. However, much of the output of the primary forest industries is exported; the sawmill industry and the pulp and paper industry, especially, contribute substantially to the value of the export trade of Canada and thereby provide an important part of the foreign exchange necessary to pay for the imports from other countries.

Statistics of manufacturing activity and total activity of the wood industries and the paper and allied industries may be found in Chapter 17.

10.1.4.1 Logging industry

The forests of Canada provide the raw materials for its sawmills and planing mills, shingle mills, veneer and plywood mills, particle board plants and pulp and paper mills as well as roundwood for export in unmanufactured state and other products such as fuelwood, poles and piling, fence posts, mining timber and Christmas trees. Tables 10.5 and 10.6 give the estimated quantities of wood cut in Canada, by province and by type of product, for 1968-70. The total volume of wood cut declined slightly from 4,304 MM cu ft in 1969 to 4,288 MM cu ft in 1970.

10.1.4.2 Wood industries

The standard industrial classification subdivides the wood industries group into the following industries: sawmills and planing mills, shingle mills, veneer and plywood mills, sash, door and other millwork plants, hardwood flooring mills, manufacturers of prefabricated buildings, wooden box factories, the coffin and casket industry and miscellaneous wood industries. The latter item is further subdivided into the wood preservation industry, the wood handles and turning industry, particle board, and miscellaneous wood industries.

The sawmills and planing mills, the shingle mills, the veneer and plywood mills and the particle board plants (the latter are included in the miscellaneous wood industries group) use mainly roundwood as a raw material and sometimes are called primary wood industries; they are dealt with separately below. The other industries, which constitute the secondary wood industries, further manufacture part of the production of the primary wood industries into a great variety of products. However, most of the production of the primary wood industries is not further processed.

Sawmill and planing mill industry. Lumber is by far the most important single commodity in this industry and British Columbia is the most important province in this field. The total value of shipments of establishments classified to this industry in 1970 amounted to \$1,135.4 million of which lumber accounted for \$925.4 million; shipments of lumber from British Columbia alone amounted to \$632.2 million (Tables 10.7 - 10.8).

In addition to the lumber produced by the sawmill and planing mill industry a small amount is produced by establishments classified to other industries bringing total lumber production in Canada in 1970 to 11,263 MMfbm compared with 11,535 MMfbm in 1969.

Shingle mill industry. Most of the shingles and shakes produced in Canada are from British Columbia mills. All establishments in this classification reported shipments of 1,971,650 squares of shingles and shakes valued at \$31.5 million in 1970. British Columbia alone accounted for 1,831,980 squares valued at \$30.1 million. However, it should be mentioned that considerable quantities are produced by establishments classified to other industries and by individuals intermittently operating one or two shingle machines or producing by hand; although no adequate measure of this production is available, it is known to contribute significantly to the total. Of the total production in 1970, 2,202,526 squares were exported, of which 2,166,289 squares went to the United States.

Veneer and plywood industry. The production of hardwood veneer and plywood in Canada is confined largely to the eastern provinces and the production of softwood veneer and plywood almost entirely to British Columbia. For the latter, Douglas-fir is most commonly utilized because of the availability of large-diameter logs of this species from which large sheets of

clear veneer can be obtained. Of the hardwoods, birch is by far the most important species. Although most of the raw materials for this industry are of Canadian origin, some decorative woods are imported, particularly walnut.

Most of the production of softwood veneers is further manufactured into softwood plywood by Canadian mills. Some of the hardwood veneers are also shipped to other veneer and plywood mills in Canada for further manufacture or to other industries such as the furniture industry for veneering purposes but a significant portion is exported. Total exports in 1970 amounted to 768,339 M sq ft valued at \$24.8 million, of which 684,229 M sq ft valued at \$19.3 million went to the United States.

Most of the plywood is consumed in Canada although exports are not unimportant. In 1970 these amounted to 23,223 M sq ft of hardwood plywood valued at \$3.5 million and 601,444 M sq ft of softwood plywood valued at \$41.6 million. The greater part of the exports of hardwood plywood went to the United States (16,880 M sq ft valued at \$2.8 million) but most of the softwood plywood exports went to Britain (424,895 M sq ft valued at \$29.2 million). Quantity and value of veneer and plywood shipments for 1968-70 are given in Table 10.9.

10.1.4.3 Paper and allied industries

The standard industrial classification subdivides the paper and allied industries group into the following industries: the pulp and paper industry, the asphalt roofing manufacturers, the paper box and bag manufacturers, and other paper converters. Statistics of manufacturing activity and total activity of the paper and allied industries group are given in Chapter 17.

Pulp and paper industry. This industry is by far the most important of the group. For many years it has been the leading industry in Canada contributing about 2% of the total gross national product and 12.5% of the total value of the country's exports in 1970. In that year there were 139 pulp and paper mills in operation.

These mills consume enormous quantities of roundwood: 17,070,687 cunits with a cost value of \$582.3 million being so used in 1970. In that year, 107,100 cunits of pulpwood were imported and 929,900 cunits were exported. In addition, pulp and paper mills use wood residues of the sawmill and other industries for pulping such as cores of peeler logs, slabs and edgings or wood chips, shavings, and, recently, sawdust. The total of such wood residues used by the industry in 1970 amounted to the equivalent of 6,140,330 cunits of pulpwood, valued at \$152.2 million. The industry also consumes large amounts of electric power, chemicals and other goods and services and requires large quantities of clean water.

Some of the production of the pulp and paper industry is consumed in Canada or serves as a raw material for the paper-using or secondary paper and allied industries and certain other industries, but a great part of it is exported, particularly newsprint and various types of pulp, most of it to the United States. Some plants included in the pulp and paper industry classification also convert basic paper and paperboard into more highly manufactured papers, paper goods and boards but their output represents only a small part of Canada's total production of converted papers and boards. Table 10.10 gives shipment and production figures for pulp and Table 10.11 gives shipments of basic paper and paperboard for 1968-70.

Table 10.12 shows exports of pulp and newsprint for 1968-71. Canada, the US, Finland, Norway and Sweden together produced 70.5% of the world supply of pulp in 1969. Seven countries, Canada, the US, Japan, Finland, the USSR, Sweden and Britain, accounted for over 82% of the estimated world production of newsprint in 1970, with Canada contributing over 38%.

Asphalt roofing manufacturers. These establishments produce composition roofing and sheathing, consisting of paper felt saturated with asphalt or tar and, in some cases, coated with a mineral surfacing. Their total shipments in 1970 were valued at \$39 million.

Paper box and bag industries. These industries include manufacturers of folding cartons and set-up boxes, manufacturers of corrugated boxes and manufacturers of paper bags. Their total shipments in 1970 amounted, respectively, to \$182.8 million, \$281.8 million and \$191.8 million, compared with \$174.6 million, \$274.1 million and \$184.4 million, respectively, in 1969.

Other paper converters. This group produces a host of paper products such as envelopes, waxed paper, clay-coated and enameled paper and board, aluminum foil laminated with paper or board, paper cups and food trays, facial tissues, sanitary napkins, paper towelling and

napkins, toilet tissue, etc. The total value of manufacturing shipments of this industry in 1970 amounted to \$384.3 million compared with \$365.9 million in 1969.

10.2 Fisheries

The federal government has full legislative jurisdiction over the coastal and inland fisheries of Canada, and all laws for the protection, conservation and development of these fisheries resources are enacted by Parliament. The management of fisheries is, however, shared with provincial governments to which certain administrative responsibilities have been delegated.

The federal Department of the Environment exercises responsibility for the management of all fisheries, both marine and freshwater, in Nova Scotia, New Brunswick, Newfoundland, Prince Edward Island, the Yukon Territory and Northwest Territories. In Ontario, Manitoba, Saskatchewan and Alberta the management of all fisheries is conducted by the provincial governments. In Quebec, the provincial government manages both marine and freshwater fisheries, but the inspection of fish and fishery products produced for sale outside the province is carried out by the federal Department of the Environment, as it is in all other provinces. In British Columbia, the fisheries for marine and anadromous (fish that migrate to the sea from fresh water) species are managed by the Department of the Environment, but the provincial government manages its freshwater fisheries. In the national parks the fisheries are managed by the Canadian Wildlife Service, Department of the Environment.

Licences for sport fishing in all provinces are distributed by the respective provincial government which retains all revenues so collected. Sport fishing licences in the Yukon Territory and Northwest Territories are distributed by the federal Department of the Environment.

The mutual interest of federal and provincial governments in fisheries problems is recognized in the undertaking of joint studies and programs, frequently on a regional basis. Regional committees established in recent years have brought together representatives of all governments concerned for periodic discussion. Three groups have evolved: the Federal-Provincial Atlantic Fisheries Committee consisting of representatives of the federal government and of the governments of New Brunswick, Newfoundland, Nova Scotia, Prince Edward Island and Quebec; the Federal-Provincial Freshwater Fisheries Committee comprising representatives of the federal government and of the governments of Ontario, Alberta, Manitoba and Saskatchewan; and the Federal-Provincial British Columbia Fisheries Committee.

Sub-committees make recommendations for industrial development, research and marketing problems. The main committee in each case co-ordinates, where practicable, all activities in the respective fields of responsibility of its members and suggests to the respective governments means of carrying out fisheries programs and projects of common concern. These include the development of methods and techniques in the catching of fish and of shore and plant facilities, and studies of the economics of fisheries to ensure that any proposed program of development is soundly based.

10.2.1 Federal government activities

The work of the federal government in the conservation, development and general regulation of the nation's coastal and freshwater fisheries is performed, under the Minister of the Environment, by the Fisheries and Marine Service which incorporates the staff of the Fisheries Research Board, and the Fisheries Prices Support Board. The functions of the Fisheries Research Board are covered in Chapter 9, Section 9.2.4.

The Fisheries and Marine Service. Canada's Fisheries and Marine Service, a component of the federal Department of the Environment, is responsible for the over-all management of the fisheries resources of the nation's coastal and inland waters. Jurisdiction over fisheries is exclusively federal under Canada's constitution, the British North America Act, 1867, although, as stated above, management responsibilities in fisheries have been delegated over the years to some provinces. The importance of the federal role in fisheries is emphasized in a clause of the Government Organization Act, 1970 designating the Minister of the Environment as also the Minister of Fisheries of Canada.

Two distinct but closely related elements are combined within the present Fisheries and Marine Service: the operating branches responsible for fisheries management and development programs, and the Fisheries Research Board of Canada, concerned with research

programs aimed at conserving and enhancing aquatic renewable resources and maintaining the biological fitness of the aquatic environment; and the Marine Sciences Directorate responsible for providing charting, scientific services and information on the marine environment. In addition, several appointed public corporations and boards are involved in activities closely aligned with those of the Fisheries and Marine Service, including the Fisheries Prices Support Board, the Canadian Saltfish Corporation and the Freshwater Fish Marketing Corporation.

General direction of the Fisheries and Marine Service is provided by a small headquarters staff at Ottawa headed by a Senior Assistant Deputy Minister. Operations offices, administered by regional directors, are located at Vancouver, BC, Winnipeg, Man., Quebec, Que., Halifax, NS, and St. John's, Nfld. Research institutes and laboratories are located at a number of locations throughout Canada.

International fisheries. Many of the deleterious effects of man on his aquatic resources are outgrowths of historical practice, insufficient knowledge, multiple uses of water, social and economic conditions, and national and international competition. Problems under national control are corrected as conditions warrant but many resources are shared with other nations and must be managed jointly.

Canada co-operates with many other nations in obtaining scientific data and formulating management proposals required to ensure the rational development and conservation of fisheries of common concern through membership in nine international fisheries commissions and one international council. These international organizations are established under the terms of formal conventions and assume responsibility for the investigation of specific living marine resources in the defined areas to which the terms of the respective conventions apply. Canadian representatives on these international bodies are appointed by Order in Council and include officials of the Department of the Environment and members of the fishing industry. Canada is a party to the following: the *Convention between Canada and the United States of America for the Preservation of the Halibut Fishery of the Northern Pacific Ocean and Bering Sea*; the *Convention between Canada and the United States of America for the Protection, Preservation and Extension of the Sockeye Salmon Fisheries in the Fraser River System* (pink salmon added subsequently by protocol); the *International Convention for the High Seas Fisheries of the North Pacific Ocean*; the *Interim Convention on Conservation of North Pacific Fur Seals*; the *International Convention for the Northwest Atlantic Fisheries*; the *Convention on Great Lakes Fisheries between Canada and the United States of America*; the *International Convention for the Regulation of Whaling*; the *Convention between the United States of America and the Republic of Costa Rica for the Establishment of an Inter-American Tropical Tuna Commission*; the *International Council for the Exploration of the Sea*; and the *International Convention for the Conservation of Atlantic Tunas*.

As evidence of its support for international consultation and co-operation in fisheries, Canada maintains active membership in the Committee of Fisheries of the Food and Agriculture Organization of the United Nations and in the Codex Alimentarius Commission which is concerned with world food quality standards.

In addition to co-operating with other nations to conserve high seas fisheries resources through international agreements, Canada has taken further action to protect the in-shore fisheries in the coastal areas by establishing a 12-mile territorial waters limit and certain defined fishing zones. Canada excludes from these areas the fishing vessels of other nations except those having traditional fishing interests. Negotiations have been initiated with these latter countries to phase out their fishing operations in Canada's Territorial Sea and Fishing Zones. Canada also enters into bilateral agreements as necessary to overcome specific fisheries problems.

The Fisheries Prices Support Board. Established under the Fisheries Prices Support Act of 1944, the Fisheries Prices Support Board is responsible for investigating and, where appropriate, recommending government action to support prices of fishery products where declines are experienced. The basic principle of the legislation is to protect fishermen against sharp declines in prices and consequent loss of income due to causes beyond the control of the fishermen. The Board is responsible to the Minister of Fisheries and consists of a chairman, who is a senior officer of the Fisheries and Marine Service of the Department of the Environment, and five members chosen from the fishing industry in the various fishing regions of Canada.

The Board has the authority to buy quality fishery products under prescribed conditions and to dispose of them by sale or otherwise, or to pay to producers the difference between a price prescribed by the Board and the average price the product actually commands. The Board has no power to control prices other than its purchase policy nor has it any jurisdiction over operations in the fishing industry or the fish trade. Money necessary for dealings in fishery products is available to the Board from the Consolidated Revenue Fund to a maximum amount of \$25 million annually on recommendation of the federal Treasury Board and authorization of the Governor in Council.

The government authorized the Board to operate a groundfish price stabilization program in 1971 designed to forestall distress selling in normal markets while ensuring fair returns to primary producers and processors. Since market conditions remained buoyant, it was not necessary for the Board to acquire fishery products but the fact that a program was in place contributed in maintaining orderly marketing conditions.

Since 1966 the Fisheries Prices Support Board has operated yellow perch price stabilization programs. Under the 1971 program the Board acquired 198,000 pounds of perch fillets at 40 cents per lb. All product was returned to the supplier by the end of the fiscal year at cost. This program provided some market stability for this product and operated without loss to the Government of Canada.

In 1971, a deficiency payment program was authorized for the 1970 salt cod production to ensure that the prices paid to fishermen approximated those of the previous year. Payments to fishermen under this program were actually made during the fiscal year 1971-72, after the final settlement to the fishermen by the Canadian Saltfish Corporation had been established. During the 1971-72 fiscal year, 4,572 individual payments were made to fishermen for a total expenditure of \$244,986.

To assist in meeting food fish requirements for the World Food Programme and the Canadian International Development Agency, the Board has acted as purchasing agent for canned fish products. During the year the Board acquired 168,641 cases of canned mackerel and 174,639 cases of canned herring.

To enable the Atlantic Coast groundfish exporters to plan and co-ordinate their production activities in relation to market requirements, the Board, through the facilities of the Marketing Services Branch of the Fisheries and Marine Service, provides a market outlook service to meet the increasing needs of the industry in terms of market information and to expand and increase the frequency of these market outlook reports. The objective is to provide the industry at the beginning of the fishing season with a short-term supply and demand outlook of the US market for fillets and blocks of the major groundfish species, followed by periodic situation reports. The supply outlook covers the major producers of groundfish such as Canada, Iceland, Norway, Denmark and Greenland.

Canadian Saltfish Corporation. The Canadian Saltfish Corporation was established under the Saltfish Act and became operative on May 4, 1970. Its main purpose is to improve the earnings of fishermen and of other primary producers of salt cured fish. It does this through the production or purchase, processing and marketing of salt cod from participating provinces.

The Corporation, whose head office is at St. John's Nfld., consists of a board of directors composed of a chairman, whose office is in Ottawa, a president who is general manager, one director for each participating province and not more than five other directors, all of whom are appointed by the Governor in Council. It is assisted by an Advisory Committee of 15 members, also appointed by the Governor in Council, at least half of whom are fishermen or representatives of fishermen. The limit of the Corporation's financial obligations is \$10 million and the Corporation is required to operate without grant appropriation from Parliament. It is empowered to distribute excess of income over expenses to participating fishermen and other primary producers.

In 1972, the participating provinces were Newfoundland, and Quebec in respect of the lower north shore of the St. Lawrence River. The results of the 1970 and 1971 seasons permitted the Corporation to make additional payments of approximately \$500,000 for each of these two years.

The Freshwater Fish Marketing Corporation. This Corporation was established in 1969 for the purpose of marketing and trading in fish, fish products and fish by-products in and out of Canada to ensure more orderly marketing for the benefit of the whole fishery and to achieve higher and more stable prices for the catch.

10.2.2 Provincial government activities

Newfoundland. The provincial Department of Fisheries, in conjunction with the Newfoundland Fisheries Development Authority, a Crown corporation established in 1953, is concerned mainly with improvement and development of fishing and production methods. It conducts experiments and demonstrations in new designs of fishing gear as well as the modification of existing types, the construction of multi-purpose fishing craft and the exploration of potential fishing grounds with a view to increasing catching efficiency.

Loans are made to processors for the establishment and expansion of fish processing plants and for deepsea draggers. Aid to fishermen for the construction of modern vessels capable of a greater variety of fishing operations and larger production is provided by loans from the Newfoundland Fisheries Loan Board. The Fishing and Coasting Vessels Rebuilding and Repairs (Bounties) Act, 1958 authorizes financial assistance in maintaining and prolonging the life of the existing fleet. The Coasting Vessels (Bounties) Act, 1959 authorizes the granting, for locally built ships, of a maximum bounty of \$150 per ton for vessels of between 100 and 400 gross tons. The Fishing Ships (Bounties) Act, 1970 authorizes the payment of a bounty of \$200 per registered gross tonnage on boats 10 tons under deck up to 150 tons which are built under permit. An Inshore Fisheries Assistance Programme provides a bounty of \$10 per foot on boats measuring from 20 to 30 ft and \$12.50 per foot on boats measuring 31 to 35 ft. Bounties are also paid to fishermen on certain types of synthetic fibre fishing nets and lines.

Other services include advising fishermen on gear and equipment, industrial research, plant construction and engineering, and assistance to fishermen's unions. The Fisheries Salt Act, 1957 and the Fishing Salt Regulations, 1969 authorize rigid control over the sale and distribution of fisheries salt.

The inland waters of Newfoundland, although they provide excellent sport fishing, are not commercially exploited. The lakes and ponds actually remain under the authority of the Department of Tourism but, under federal-provincial agreement, these waters, including rivers and streams, are under federal control in matters of conservation and guardianship.

Prince Edward Island. The sea and inland fisheries of Prince Edward Island are administered by the Fisheries Service of the federal Department of the Environment. The provincial Department of Fisheries supplements federal activity in this area and is concerned principally with quantifying and, within the terms of the provincial role in fisheries management, maximizing returns, both social and economic, to those engaged in the fisheries industry. The Department provides technical assistance and, in conjunction with the federal fisheries organizations, engages in experimental and developmental work in such fields as fishing methods, resource inventories, statistical studies and management assistance.

Loans are made available to fishermen and the fishing industry through the Prince Edward Island Lending Authority, a Crown corporation established in 1969 which is empowered to grant credit in the sectors of fisheries, industry, tourism and agriculture. The provincial responsibilities in the area of freshwater fisheries are discharged by the Fish and Wildlife Division of the Department of Tourist Development.

Nova Scotia. Although the federal government has exclusive jurisdiction over the marine and inland fisheries of Nova Scotia and attends to all phases of their administration, the Nova Scotia government operates in several fields where provincial initiative is found to be necessary and appropriate due to the importance of the fishery resources in terms of employment, industry, trade and recreation.

The Nova Scotia Department of Fisheries concentrates most of its efforts on training fishermen and on resource development. It operates a Fisheries Training Centre in Pictou providing year-round facilities for all commercial fishermen and it conducts a program of short courses for in-shore fishermen in selected fishing communities throughout the province. The principal subjects of instruction are engines, navigation and nets and gear. The Resource Development Division organizes and conducts explorations of fishing grounds for new resources and studies and introduces new, improved gear and methods to the industry. Recently, work has been carried out on "off-bottom" methods of rearing oysters and mussels. An oyster hatchery went into production in 1971 which will facilitate studies and rearing trials with other shellfish species.

Loans are made available to fishermen and to the fishing and fish processing industries

through the Nova Scotia Resources Development Board, a branch of the Nova Scotia Department of Development.

In recent years, Nova Scotia, through the Wildlife Conservation Division of its Department of Lands and Forests, has spent a considerable amount of money on management and investigation in certain lakes and streams in the province with a view to improving the freshwater sport fishery. A continuing program of lake and stream investigations was begun in 1961 to obtain information useful in formulating a fish management program. A system of rearing ponds, capable of producing 100,000 yearling speckled trout annually, has been established on the Moser River in Halifax County. Several projects dealing with reclamation, rainbow trout and smallmouth bass are also being conducted. A fisheries biologist is employed full-time by the Division.

The Nova Scotia Department of Tourism has been actively promoting saltwater sport fishing. In conjunction with the provincial Department of Fisheries and the federal Department of Manpower and Immigration, it arranges courses for captains contemplating the establishment of charter services, awards prizes to sportsmen with the largest tuna and bass catches of the season, sponsors the International Tuna Cup Match and the Intercollegiate Game Fish Seminar and Match, and publishes a brochure listing charter boats available in the province.

New Brunswick. Commercial fishing is one of the most important basic industries of New Brunswick, employing about 6,200 fishermen with annual earnings of \$17 million and 3,000 plant workers. The annual marketed value of fish products is about \$67 million of which 90% is exported to the United States. New Brunswick's commercial fisheries, both tidal and inland, are under the legislative jurisdiction of the federal Department of the Environment; angling in Crown waters is the responsibility of the provincial Department of Natural Resources.

The New Brunswick Department of Fisheries and Environment has five Branches. The General Administration Branch is responsible for the planning, organization and control of all general administrative services of the Department, including program formation, financial administration, personnel management and public relations. Close liaison is maintained with other federal and provincial departments and agencies concerned with the fishing industry of the province.

The Boatbuilding and Maintenance Branch, employing marine engineers, a naval architect and boat inspectors, studies, modifies and approves plans and specifications of the many types and classes of fishing vessels employed in the provincial fisheries and inspects vessels financed by the Fishermen's Loan Board. New designs are encouraging the trend toward larger combination multipurpose vessels. Under the experienced leadership of the Branch, New Brunswick fishermen are now operating a fleet geared for diversified operation, permitting inexpensive and easy conversion from one fishery operation to other more lucrative occupations throughout the season. A 600-ton-capacity marine railway dry dock constructed in 1968 at Bas Caraquet serves the off-shore fishing fleet of northeast New Brunswick, and a 200-ton transfer system adjacent to the dry dock provides winter lay-up and repair facilities for smaller vessels. Nearby shipbuilding and repair facilities provide ready and adequate service to an expanding off-shore fleet.

The Exploratory Fishing and Education Branch continues the experimental programs carried on for many years in co-operation with the federal Department of the Environment. Technical and financial assistance are made available to the New Brunswick Department of Fisheries and Environment for projects undertaken toward modernizing fishing and processing methods, experimenting with new types of fish-catching equipment and demonstrating its operation to fishermen, and exploring and developing hitherto unexploited or under-exploited species of molluscs, crustaceans, fishes and seaweeds. This work has resulted in the establishment of snow crab, shrimp, Irish moss, tuna and eel fisheries in New Brunswick.

During 1972-73, several development projects were undertaken on a shared-cost basis with the federal Department of the Environment including a technological development program for dulce cultivation on Grand Manan Island; a survey of Irish moss concentrations at the entrance to the Chaleur Bay (west of Miscou Island, north of Caraquet Island and north of Blue Cove); a study of the snow crab and rock crab industries in New Brunswick; development of a prototype system of refrigeration for shrimp vessels, shrimp exploration in the Bay of

Fundy, and a study of the shrimp industry in northeastern New Brunswick; a study of mollusc harvesting methods, a feasibility study for a mollusc processing plant in northeastern New Brunswick and exploration for ocean quahaugs with a hydraulic dredge in Northumberland Strait; oyster culture and rearing experiments in Baie de Buctouche, Northumberland Strait and Ruisseau Bar pond, Chaleur Bay; sardine exploration in the Gulf of St. Lawrence; capelin exploration with a New Brunswick-based vessel on the Grand Banks of Newfoundland; introduction of mackerel purse-seining on in-shore vessels in the Cape Bald region of Northumberland Strait; tuna exploration in oceanic waters off the Gulf of Maine; and installation of bait-freezing facilities on Campobello Island.

The Branch operates a School of Fisheries at Caraquet, in northeastern New Brunswick where, in the 1971-72 academic year 500 fishermen took training in the various phases of their trade. The School teaches navigation, administration, marine biology, oceanography, radiotelephone, metal and woodworking, arithmetic and languages. In 1972, 44 graduates received practical training aboard large modern fishing vessels under a joint federal-provincial program of technical upgrading. Following a few weeks of training, many of the apprentices are taken on as regular crew members.

The Fish Inspection and Marketing Branch administers the New Brunswick Fish Inspection Act and Regulations although, for greater effectiveness and to avoid duplication of personnel, they are applied by 30 fish inspectors of the Fisheries Service of the federal Department of the Environment Maritimes Area. The Branch actively promotes the expansion and modernization of existing fish processing plants and the establishment of new plants in the province. Its efforts include studying existing markets and developing new ones for fishery products at home and abroad in collaboration with other government agencies, federal and provincial. Emphasis is placed on promoting the consumption of fishery products within the province, on the development of new products for domestic and export markets, and on the training of plant personnel in management and production controls.

The Fishermen's Loan Board of New Brunswick, a body corporate operating under the jurisdiction of the Minister of Fisheries and Environment, was established in 1946 and now operates under the Fishermen's Loan Board Act of 1952 and the regulations of November 1, 1963. Its function is to improve and develop the fishing industry of the province by providing adequate financial assistance at moderate rates of interest to individual fishermen, groups, associations, processing firms and corporations; to construct modern fishing vessels; and to make major repairs and purchase engines and equipment. Since its inception, the Board has granted 2,440 loans to New Brunswick fishermen for a total of over \$34.6 million; outstanding loans amounted to \$14.6 million in 1971.

Loans are repayable within a five-year period on small in-shore fishing vessels; repayment schedules on large trawlers may extend to 15 years, based on the gross proceeds of the catch. Most of the new fishing vessels being built for fishermen and fish processing firms in the province are financed by the Board. The Board acts as agent for the federal Department of the Environment's financial assistance program which makes funds available to owners of new fishing vessels not eligible for the shipbuilding subsidy granted by the Department of Industry, Trade and Commerce.

Sport fishing contributes substantially to the economy of the province. Great Atlantic salmon rivers like the Miramichi, the Restigouche and the Saint John are known around the world for their prolific production of this majestic game fish and attract many thousands of tourists to the province each year. Anglers catch as many as 50,000 salmon a year in the Miramichi system alone. Many other species are also sought after by both residents and non-residents in the hundreds of streams, rivers and lakes of the province.

Quebec. The sea fisheries of Quebec are administered by the Fisheries Branch of the Quebec Department of Industry and Commerce. The Branch comprises three Divisions — Research, Economics, and Technical Services.

The Research Division carries out experiments and studies on the biological aspects of commercial fish species, the processing of seafood for marketing and the testing of new types of fishing gear. The Biology Service uses research facilities at Grande-Rivière and particularly those of the Quebec government science complex at Ste. Foy in suburban Quebec.

One of the main functions of the Economics Division is to administer the loan program covering the construction and repair of boats and the purchase of various types of fishing gear.

In 1972, the active off-shore fishing fleet consisted of 21 steel trawlers, including two 125-foot midwater trawlers, two 127-foot trawlers, one 100-foot seiner, four 89-foot trawler-seiners and twelve 82-foot trawlers. There were also 62 wooden trawlers ranging from 60 to 87 feet in length and 58 vessels of various descriptions. As at March 31, 1972 the owners of these vessels held outstanding government loans totalling nearly \$9 million, \$400,000 less than the year before. The Economics Division conducts regular inspections of fishing vessels, keeps maintenance and repair crews under close supervision and checks the tenders submitted to fishermen by shipyards. The Division also carries out the socio-economic analyses required to plan government measures and ensure the success of policies and programs relating to the sea fisheries. The Division includes an Engineering Service which draws up plans and specifications with a view to improving fishing gear.

The Technical Services Division has three Services; the Construction and Maintenance Service prepares plans and initiates various construction and repair projects affecting collective facilities used by the fishing industry. The Equipment Administration Service is in charge of the facilities provided by the Fisheries Branch. These include 28 cold storage warehouses with a daily freezing capacity of 500 tons and a storage capacity of 25 million lb., three winter harbours, fish-collecting stations, etc. The Protection Service issues fishing permits, conducts land and sea patrols and investigates breaches of regulations.

The Fisheries Branch has its head office in Quebec City and branch offices in the main fishing centres. In conjunction with the Department of Education, it conducts a training program for fishermen, technicians and factory workers. To this end, it maintains a fisheries school and a training vessel brought into service in June 1968. The Fisheries Branch co-operates closely with the Quebec Planning and Development Board and the Eastern Quebec Regional Administrative Conference in implementing the different development programs.

Sport fishing in the inland waters of Quebec is under the jurisdiction of the Department of Tourism, Fish and Game, which employs 531 full-time conservation officers and issues the required sport-fishing licences. Six hatcheries are maintained by the Department, where speckled trout, brown trout, rainbow trout, grey trout, ouananiche, maskinonge and salmon are reared for the restocking of lakes and streams.

Excellent fishing may be found in all provincial parks and reserves. Gaspé and Laurentide Parks are renowned for trout fishing, and the waters of Chibougamau Reserve and La Vérendrye Park, situated on the height of land, abound in pickerel, pike and grey trout. Eleven salmon rivers are open to anglers — the Petit Saguenay, the Laval, the Moisie, the Matane, the Cap Chat, the Ste. Anne, the St. Jean, the Matapédia, the Dartmouth, the Port Daniel and the Petite Cascapédia.

A committee made up of directors of the Quebec Wildlife Federation makes recommendations to the provincial government concerning legislation required for the maintenance of satisfactory fishing conditions and other problems arising out of the ever-changing conditions of modern life and their effect on the wildlife of the province.

Ontario. The fishery resources of Ontario are administered by the Commercial Fish and Fur Branch and the Sport Fisheries Branch of the Ministry of Natural Resources, under the authority of the Federal Fisheries Act, the Ontario Fishery Regulations, the Ontario Game and Fish Act and the regulations connected therewith.

The commercial fishing industry in Ontario, with a capital value of over \$12 million, produces an annual yield of from 53 million lb. to 72 million lb. of fish including nearly ten million lb. of bait fish. Fishermen received \$10 million from the sale of this catch. It is estimated that subsequent handling, processing and servicing of fish will result in a contribution of about \$20 million to the provincial economy. The industry, although widely scattered throughout the province, is centred chiefly on the Great Lakes, particularly Lake Erie. Employment is provided by the industry for about 1,900 commercial food-fish fishermen and 2,500 bait-fish fishermen directly and for many more indirectly.

The species harvested commercially include yellow perch, smelt, whitefish, pickerel, pike, lake trout, herring, chub, carp, white perch, sturgeon, white bass, bullhead, catfish, eel, goldeye, sunfish, burbot, freshwater drum, rock bass, crappie, sauger and suckers. Nearly 90% of all fish landed in Ontario are harvested from the Great Lakes. More than 500 smaller inland lakes are commercially fished, mainly those in the northwestern portion of the province. Careful management of these lakes is essential to ensure continued production.

The types of fishing boats in use vary from small craft to 70-foot tugs, and the types of gear vary from gill-nets, pound-nets and trap-nets, seines, trawls and baited hooks to small hand-operated seines and dip-nets. Fishing methods and equipment have been modernized extensively during the past few years. Diesel-driven steelhull tugs with depth sounding devices, radar and ship-to-ship and ship-to-shore communications have been in use for some time. Knowledge of the fish and their movements is constantly being expanded from biological research findings. Modern icing facilities and transportation methods are in use as well as new types of fishing gear. Programs to develop more efficient and economical fishing and processing techniques have resulted in efficient bulk-handling techniques for smelt and a viable fish meal plant which produces a marketable product from fish-processing wastes and fish unsuitable for food. Trawling has proved very efficient in harvesting smelt on a year-round basis on Lake Erie.

Most Ontario fishermen are organized into various local associations and many of these associations are in turn represented by the Ontario Council of Commercial Fisheries which performs important services to the industry.

Ontario is one of the most attractive fishing areas on the continent, having an estimated freshwater area of approximately 68,490 sq miles. Excellent angling opportunities are available for such prized fish as brook, rainbow and lake trout, yellow pickerel (walleye), smallmouth and largemouth bass, northern pike and maskinonge. The recreational angling fraternity is no longer restricted to open water — fishing is now a year-round sport. In many stores and camps throughout the province, a wide selection of ice-angling equipment, including snowmobile rentals, is available to the fisherman and seasons have been extended in many parts of the province for certain species of fish to facilitate winter angling. Annual revenue from the sale of angling licences prior to 1971 was in the neighbourhood of \$6 million. As of the 1971 summer season, licences are no longer required of residents but an annual fee of \$8.50 is payable by non-residents for fishing privileges. The management of this valuable resource is administered by a field staff of well-trained conservation officers and biologists.

Ontario operates 16 fish hatcheries and rearing stations; the main species reared include brook, rainbow and lake trout, splake, smallmouth and largemouth bass and maskinonge. The basic aim of the hatcheries is the economic production of high-quality species to sustain and develop recreational fishing throughout the province. Studies are conducted on the improvement of transportation and planting techniques to improve survival and returns to the angler; such transportation includes the use of aircraft, helicopters and trucks. The marking of hatchery fish by removal of a single fin is providing valuable information on survival of fish stocks and angler success.

A significant research program contributes to the understanding of principles operating in the aquatic ecosystems. Programs are directed toward specific fisheries management problems in the Great Lakes and in the smaller inland waters.

Manitoba. Manitoba's interior location belies the importance of its fisheries resources which stems from an abundance of fresh water in about 40,000 sq miles of lakes and streams covering 16% of the area of the province.

In the year ended March 31, 1972, the commercial fishery produced 12.8 million lb. of fish, a 9% decrease from the 14.1 million lb. of the previous year. The value to the fishermen increased \$268,800 to \$2.4 million. Northern waters contributed 5.6 million lb. (43%), followed by Lake Winnipegosis with 3.1 million lb. (24%) and Lake Manitoba with 1.8 million lb. (13%). The production from Lake Winnipeg was 1.5 million lb. (11%), an increase of 1.1 million lb. as a result of the lake reopening after the closure for mercury pollution. Sixteen species or groups of species normally enter into the commercial catch but only a few species predominate. In 1971-72, whitefish contributed 4.6 million lb., pike 2 million lb. and walleye (pickerel) 2 million lb. A miscellany of species, primarily suckers and carp, contributed 4,205 lb. All of the commercial catch is marketed by the Freshwater Fish Marketing Corporation, a federal Crown agency, and is exported mainly to the United States. Gill-nets are the main fishing gear. About 966 fishermen were employed during the open-water fishing and 1,575 took part in winter fishing.

Fisheries administration is under the control of the Department of Mines, Resources and Environmental Management and is divided into research, program development and field operations sectors. Field operations are divided among four regional units. Conservation

officers enforce both the commercial and the angling regulations and carry out numerous other duties in connection with fisheries management. Professional biologists carry out a continuing program of studies which not only monitor the resource but also extend the knowledge of it. Fish culture plays an important role in fisheries management. Pickerel hatcheries are located on Lakes Winnipegosis and Manitoba. Lake Winnipeg has two hatcheries, one at Dauphin River and the other at Grand Rapids. A trout hatchery is located in the Whiteshell Provincial Park. Two temporary facilities for collection of spawn are also used.

The sport fishery is an important use of the fishery resource, with walleye, pike, perch and several kinds of trout being the principal sport species. A total of 138,327 angling licences were sold in 1971-72 of which 108,331 were purchased by Canadian residents.

Saskatchewan. The Fisheries and Wildlife Branch of the Department of Natural Resources is responsible for administration of the fisheries resources of Saskatchewan. The Fisheries Section, with head office in Prince Albert, is charged with planning and developing policies and programs to ensure proper management and utilization of the fisheries and administration of both the federal and provincial Fisheries Acts and Regulations. The over-all objective is to encourage efficient multi-use of the fishery, taking into consideration the interests of the various groups wishing to use the resource.

During 1971, 2,098 fishermen obtained commercial fishing licences to fish 231 lakes. The resulting harvest of 12.5 million lb. was worth \$1.8 million to the fishermen. The industry, although widely scattered, is centred chiefly in the northern half of the province; approximately 65% of the production came from northern waters. In order of market value, the species composition of the catch was whitefish, walleye, lake trout, pike and tullibee.

Four shallow saline lakes in southern Saskatchewan produced 65,000 lb. of brine shrimp and brine shrimp eggs. These are processed for sale to fish hobbyists. An estimated one million lb. of rough fish were utilized by nine mink ranches; another 800,000 lb. were shipped to Manitoba for mink ranch use. Interest continues to grow in fish farming. In 1971, 482 fish farming enterprises were licensed to raise rainbow trout. The majority of operations, however, were intended for the private use of the owner. In spite of an estimated 80,000 lb. harvest, this form of aqua-culture is still in the experimental stages in the prairie region.

In 1971, 139,362 angling licences were sold. Northern pike, walleye, lake trout, perch, arctic grayling, rainbow trout and goldeye continue to be the principal species taken. A continuous program of inventory of sport fishing stocks is maintained to provide up-to-date information for management purposes. During 1971, 217 waters were examined. Expansion of the exotic species program continued with varying combinations of brook, rainbow, and splake trout released in 13 new waters throughout the province in 1971. More than 100 lakes and streams have been stocked with trout and salmon to date.

The provincial hatchery at Fort Qu'Appelle reared 21.4 million fish of nine species for distribution in 140 waters. Brook trout and walleye were the species most widely distributed, being stocked in 40 and 39 waters, respectively. Rainbow trout were stocked in 35 waters.

The limnological and fisheries research program is designed to provide basic information on the productivity of water bodies, to secure information on the abundance and relationship of fish species and to investigate and assess factors affecting fish populations. This information is subsequently used to develop fishery management policies and programs.

Alberta. Commercial and sport fishing are administered by the Fish and Wildlife Division of the Department of Lands and Forests, under the authority of the Fisheries Act (Canada) and the Fish Marketing Act (Alberta).

Production of commercial fish from Alberta's 6,485 sq miles of fresh water for the fiscal year ended March 31, 1972 was 5.3 million lb. a decrease from that of the previous year. The landed value of the catch was \$729,931 compared to \$826,268 in 1970-71 and the market value \$1.4 million compared to \$1.6 million.

Lake whitefish is the most valuable commercially caught fish and accounted for 66% of the total value but represented only 40% of the total landings. Pike rose to second place in market value. Tullibee, used primarily for animal food, dropped to third place and other species taken in order of market value were walleye, perch, ling, suckers, lake trout and goldeye.

A major part of the quantity of fish taken is marketed outside the province, mainly in the United States, by the Freshwater Fish Marketing Corporation.

There were 159,484 angling licences sold in Alberta in 1970-71 of which 156,575 were to residents and non-resident Canadians and 2,909 to non-resident non-Canadians. There were 404 Trophy Lake licences and 417 spear fishing licences sold during the same time period.

In 1972, a total of 185 lakes were stocked with nearly 5.2 million fish and fish eggs: 63% rainbow trout, 19% eyed walleye eggs, 7% eastern brook trout, 5% walleye fry, 3% kokanee, 2% coho salmon and the remainder in brown and cutthroat trout.

There were 354 private and 28 commercial game fish farm licences issued in 1972 and these operations handled 450,000 rainbow trout.

Fisheries in Alberta are administered on a regional basis, with six fisheries biologists located in various centres of the province and responsible for a specific geographical area. In addition to the regional staff there is a Research Group located in Edmonton consisting of two biologists and a technician, and an Aquatic Habitat Protection Group also located in Edmonton and consisting of one biologist and one technician.

British Columbia. A Fisheries Office, which was organized in 1901-02 and became very active in fish culture work, building and operating fish hatcheries and instituting scientific research into various fishery problems, was superseded in 1947 by the Department of Fisheries. This was replaced in 1957 by the Department of Recreation and Conservation, with the Commercial Fisheries Branch now being the provincial organization concerned with commercial fisheries. The administrative and regulative jurisdiction over the fisheries of British Columbia rests with the federal authority; the ownership of the fisheries in the non-tidal waters is vested in the Crown in the right of the province, as are the shell fisheries such as oyster fishing and clam fishing in tidal waters. The province administers these fisheries although the regulations covering them are made under federal Order in Council on the advice and recommendation of the province.

The provincial Fisheries Act provides for the taxation of the fisheries and, under civil and property rights, for the regulation and control of the various fish processing plants under a system of licensing. The commercial harvesting of oysters and marine aquatic plants is regulated by provincial permits and licences. Provision is also made for arbitration of disputes regarding fish prices that may arise between the fishermen and operators of the various licensed plants. The administration of the Act involves the collection of revenue and the supervision of plant operations.

Regulation and administration of net fishing in the non-tidal waters of the province, including commercial fishing and authority for regulation of the game fisheries in non-tidal waters, is vested in the Fish and Wildlife Branch which operates a number of trout hatcheries and egg-taking stations for restocking purposes.

The Branch co-operates closely with the Fisheries Research Board of Canada. The biological research into those species of shellfish over which the province has control, principally oysters and clams as well as marine plants, is conducted by the Fisheries Research Board of Canada at the Pacific Biological Station, Nanaimo, BC, under agreement with the federal and provincial authorities. The object of this research is to encourage the industry to produce better products more economically and to enable the Commercial Fisheries Branch to regulate the various species so that maximum exploitation may be obtained on a sustained-yield basis.

10.2.3 Statistics of the fishing industry

Commercial fishing in Canada provides employment for some 59,000 persons on a full-time or seasonal basis and contributes approximately \$462 million annually to the nation's economy (Tables 10.13, 10.14). Of main concern to the industry at the present time is the trend toward over-exploitation of certain species, resulting from the rapid expansion and intensification of fishing effort by domestic and foreign fleets over the past few years. The federal government is taking initiatives at the national and international levels to achieve rational management and conservation policies to safeguard fish stocks for future generations.

On the Atlantic Coast, Canada's commercial fisheries concentrate on stocks of cod, redfish, haddock, small flatfishes and herring, as well as valuable shellfish resources, notably lobsters, oysters and scallops. Pacific Coast fisheries are based principally on salmon and halibut; herring stocks, once plentiful, are recovering from a sharp decline in the late 1960s which necessitated closure of the fishery except for catches used for human consumption. The large freshwater lakes of Canada's interior produce important supplies of whitefish, perch, pickerel, trout and pike.

Landings of fish

10.2.3.1 Fish landings

Canadian landings of fish and shellfish in 1971 amounted to 2,548 million lb., 6% less than 1970 and 12% less than the peak year of 1968. Smaller catches were landed on both the Atlantic and Pacific Coasts, 7% less on the Atlantic Coast and 4% less on the Pacific Coast. The total value to Canadian fishermen at \$201 million was, however, about 1% higher than in 1970 (Table 10.15).

Atlantic Coast. On the Atlantic Coast, total landings have been declining since the peak in 1968. In 1971, they amounted to 2,225 million lb., a decline of 7% compared with 1970 and of 12% compared with 1968. The value to Atlantic Coast fishermen, however, has been increasing steadily and reached an all-time high of \$129 million in 1971 (Table 10.16).

Landings of Atlantic groundfish, taken as a whole, have been rather stable at just over 1,100 million lb. during the last seven years. Two main species of this group, cod and haddock, have been declining in volume, while redfish has been increasing. Cod and haddock landings totalled 575 and 93 million lb., respectively, in 1965; corresponding figures for 1971 were 449 and 54 million lb. On the other hand, redfish landings increased from 130 million lb. in 1965 to 249 million lb. in 1971.

Herring landings were below 1,000 million lb. for the first time since 1968. The large expansion which took place in this fishery in the mid-sixties culminated in landings of 1,200 million lb. in 1968; since that year, however, landings have declined gradually. Gross earnings

to fishermen from this fishery in 1971 were \$13.2 million, a very slight decline from the previous year.

Lobster landings at 38 million lb. were slightly higher than those of 1970 and above the five-year average for the period 1966-70. Prices to fishermen were generally higher than in 1970 and, as a result of the combination of higher prices and larger volume, gross earnings to fishermen reached an all-time high of \$33.2 million.

The downward trend in scallop landings which has been evident in recent years continued in 1971: landings totalled 11.2 million lb., 14% less than in the previous year. Higher prices to fishermen were not sufficient to maintain the value to fishermen which declined by 8%.

On a provincial basis, both quantities landed and values to fishermen were lower than in 1970 in New Brunswick, Prince Edward Island and Quebec. In Newfoundland, landings were down but values to fishermen marginally higher. In Nova Scotia, fish landings and gross earnings to fishermen were both higher.

Pacific Coast. On the Pacific Coast, landings of fish and shellfish in 1971 amounted to 228.8 million lb., valued to fishermen at \$58.6 million, a decline of 4% in quantity and of almost 3% in value compared with the previous year (Table 10.16).

Salmon runs were better than expected and British Columbia salmon fishermen enjoyed a good average year. Salmon landings are reported at 132 million lb., valued to fishermen at \$44.5 million. Corresponding figures for the five-year average 1966-70 are 141 million lb. and \$38.5 million.

Halibut was scarce on the main grounds fished by the Canadian fleet and landings at 25.3 million lb. were 14% below those of 1970, the lowest level since 1955. Prices to fishermen were, on the average, slightly lower than in 1970 and gross earnings to fishermen were \$8.1 million.

The ban on herring fishing for reduction purposes remained in effect during the year but fishing for food purposes was allowed and more than 22 million lb. were caught.

Inland fisheries landings reached 95 million lb. in 1971 at a value of \$13.4 million, an increase for both of about 4%.

10.2.3.2 Fish marketing

The total value of Canada's fishery products in 1971 reached an all-time high of \$462 million, up \$35 million from the record level set in 1970 (Table 10.17). Groundfish (Atlantic Coast) recorded the largest increase rising about 24% in value over 1970, while pelagic and estuarial, and molluscs and crustaceans showed smaller increases of 6% and 9%, respectively.

The market value of Pacific Coast fisheries products showed an over-all decline of about \$3 million compared with 1970. Groundfish contributed about \$2.2 million to the drop while the other major sub-grouping totals remained relatively constant. However, salmon, a component part of the total for pelagic and estuarial declined \$2.7 million to record the largest 1971 Pacific Coast drop for a species. Herring products more than tripled to offset the salmon decline, resulting in a constant level for this group.

The pack of Pacific canned salmon in 1971 was 1.4 million cases (48 lb.), fractionally lower than both the 1970 pack and the 1966-70 average annual pack (Table 10.18). The production of canned sockeye and coho was larger than the five-year average, while that of pink and chum was lower.

The total value of all Atlantic Coast freezings recorded a marked increase of 27.5% which exceeded the 7.0% rise in the poundage frozen (Table 10.19). The effect on prices was particularly noticeable in the instance of cod, the unit price of which jumped 50% to 42 cents per lb. at the same time cod contributed about 57% to the total Atlantic Coast increase. Other species showed a similar trend but at a very moderate rate; the over-all average price increase for the Atlantic Coast was six cents per lb.

10.3 The fur industry

A number of Canada's resource-based industries trace their origins back to the early days of settlement, but the fur trade seems to have been the least affected by technological progress. The production of wild furs is still almost the exclusive province of an individual tending a trapline in much the same way as did his forebears.

In the 1971-72 season some 40,000 trappers, operating mainly in the northern portions of the provinces in the Yukon Territory and Northwest Territories, produced 3.2 million wildlife pelts with a value of \$18 million (Table 10.20). This represented 55.5% of the total value of furs produced (\$33million) with fur farm pelts accounting for the remaining 44.5% (\$14.7 million).

In 1971-72 the value of Canadian fur production increased by 20% compared with the previous season, wildlife pelt values being 41% and farm pelts 1% higher. Ontario continues to lead the provinces and territories in fur production, accounting for 29.3% of the total value in the 1971-72 season compared with 28.4% in the previous season (Table 10.21). Increases were common to all provinces except Newfoundland and British Columbia.

Fur trapping. Ontario continued to be the most important producer of wildlife pelts, accounting in 1971-72 for 22.5% of the \$18 million of furs produced on the trapline. Other major producers were Alberta (18.3%), Manitoba (14.5%), Quebec (10.7%) and Saskatchewan (11.5%). Although the numbers of all the important Canadian fur bearers are being well maintained, the size of the annual catch is affected by a number of factors not connected with the abundance or otherwise of the respective species. The most important of these factors is the market price of raw furs. In seasons of low prices trappers will, understandably, seek other employment and the fur bearers go unharvested.

The principal kinds of wild fur pelts taken, according to value, are beaver, muskrat, lynx, seal, and fox. These five kinds accounted for 80% of the total value of wild pelts produced in 1971-72, beaver alone accounting for 35%. The number of beaver pelts produced was slightly higher than in the previous year and the average value per pelt increased from \$12.55 to \$17.18 (Table 10.20).

Both the production and the average values of all but one (seal) of the important kinds of Canadian wild furs in 1971-72 were above the 1970-71 levels continuing the trend toward firming prices which developed at the end of the 1970-71 season. This stronger market with its accent on youth-oriented styling promises to stimulate demand for both the long-haired and short-haired furs.

The role of the fur fashion designer in first rousing interest, then transforming this interest into demand at the retail level is an important one, and the results may extend right back to the trapper in the form of higher prices for his pelts. One example of the influence of the fur stylist is the recent resurgence of muskrat. For many years the coming of fall meant the appearance of the ubiquitous muskrat coat, uniformly styled and brown-dyed to resemble mink. As a result of this over-exposure, as well as in deference to the trend toward slim-line wear, the popularity of muskrat fur declined sharply in the 1950s and 1960s. However, in recent years this fur, now available in attractively styled natural and dyed coats and jackets, has made a comeback and renewed popularity has brought about higher prices for muskrat pelts.

Fur farming. Mink remains by far the most important fur bearer raised on Canadian farms, this species accounting for over 99% of the value of the fur farm production. Chinchilla and nutria are also raised on farms in this country but because of the small numbers involved the collection of statistics on nutria and chinchilla has been discontinued.

In 1935 the Canadian mink ranching industry produced 30,558 pelts with an average value of \$10.58 per pelt. At that time mink farmers were operating very much in the shadow of the larger silver fox industry. It was found, however, that mink adapted well to reproduction in captivity and pelt production increased steadily until the peak year of 1967 when the output reached 1,967,323 pelts. Mink are now raised in all provinces except Newfoundland, the principal producers in 1971 being Ontario (38.0%), British Columbia (19.1%), Quebec (10.2%), Alberta (10.2%) and Nova Scotia (9.7%).

Beginning in 1966, the industry went through a series of years when pelt prices were around or below the cost of production. This depressed market situation continued into the 1970 pelt crop year when the average pelt value was \$9.65, the lowest price since 1942. This price is substantially below the cost of production and as a result the number of mink farms has continued to decline, from 1,017 in 1969 to 675 in 1971 (Table 10.22). Pelt production suffered in keeping with this decline, amounting to 1,155,020 pelts in 1971 for a value of \$14.6 million compared with 1,778,737 pelts in 1969, valued at \$18.7 million. As in the case of the wildlife furs, the mink market strengthened in the latter part of the 1970-71 marketing season.

Although the number of mink farms declined sharply a number of the farms that ceased operations were, under the tight market situation, marginal from point of view of the quality of pelts produced, over-high production costs, or other factors. The mink farmers who are still in business are highly skilled operators who produce some of the world's finest quality mink pelts. These producers are concentrating on economy of operation, coupled with production of top quality pelts.

In 1971, 1,405 fox pelts with an average value of \$39.11 were produced on 39 Canadian farms. The principal producers were Ontario, New Brunswick and Prince Edward Island. Costs of fox farming operations have been increasing and, although fox furs are currently popular in all markets, there are no indications that this business is likely to increase in importance in the foreseeable future.

Fur marketing. The bulk of the Canadian fur crop is sold at auction through competitive bidding and, prior to 1970, fur farmers and trappers were served by eight fur auction firms located across the country. Since 1970, through amalgamation and closure, the number of auction firms has been reduced to five, with three firms handling both ranched and wild furs, and the remaining two dealing in wild furs only.

The decline in the number of marketing outlets has not been a disadvantage to Canadian fur producers. World fur buyers have a wide choice of markets and will routinely travel from Europe to Canada to attend major auctions though they are unwilling to do this for small offerings. The decline in the number of auctions has reduced the fragmentation of the Canadian fur crop and made it possible to schedule fewer but larger offerings that have been attracting buyers from many countries.

In the calendar year 1972 the value of exports of raw Canadian furs amounted to \$30.3 million (Table 10.23). The principal species exported were: mink (\$11.4 million), beaver (\$7.5 million), muskrat (\$2.5 million) and lynx (\$2.0 million). The United States, Britain, Switzerland and the Federal Republic of Germany were the principal buyers.

10.4 Wildlife

Wildlife is an important renewable natural resource. The original inhabitants of what is now Canada depended on it for food and clothing and still do in some remote areas. The coming of the Europeans brought development of the fur trade which guided the course taken in exploring and settling the land as we know it today. When the country was being opened up, a number of mammals and birds became seriously depleted or extinct. As settling progressed, wildlife habitat was reduced by cutting and burning of forests, pollution of streams, industrial and urban development, drainage of wetlands, building of dams, and other changes in the land.

Today, the arctic and alpine tundra, a major vegetational region, has begun to show serious man-made changes. The adjacent sub-arctic and sub-alpine non-commercial forests have been affected principally by increased human travel which causes more forest fires, although the great forests farther south retain much of their original character, despite exploitation. Cultivable lands, originally forest or grassland, have completely changed but they have, in some cases, become more suitable than the original wilderness for some forms of wildlife. The harvestable surplus of game and fur species across Canada is seldom fully utilized and wildlife will remain generally abundant where habitat is preserved and management enlightened.

Today, Canada is known for its varied and abundant wildlife. It maintains most, or all, of the world's stock of woodland caribou, mountain sheep, wolves, grizzly bears and wolverines. These animals exist because of the vast habitat and because of the efforts that have been made to preserve them.

In 1885, the Rocky Mountain Park (now Banff National Park) was established in Alberta, preserving an area of over 2,500 sq miles in its natural state; in 1887, the continent's first bird sanctuary was established at Last Mountain Lake in Saskatchewan; in 1893 when wood bison faced extinction, laws were passed to protect them; and in 1907, a nucleus herd of plains bison was established at Wainwright in Alberta. These were among the early attempts at wildlife conservation in Canada.

For a long time, certain species were protected from man and predator. Now, having a better understanding of how nature works, it is recognized that many factors combined cause fluctuations in wildlife numbers, and hunting seasons and bag limits are based to a greater extent on environment. Given a fully stocked environment, the annual increase need only replace the losses. Surplus production can therefore be safely taken by predatory animals or, in the case of game species, by man.

As a natural resource, wildlife within each province comes under the jurisdiction of the provincial government. However, the federal government does have responsibility for wildlife on federal land and for research and management of migratory birds.

10.4.1 The Canadian Wildlife Service

The Canadian Wildlife Service (CWS) began as an agency to administer the Migratory Birds Convention Act passed in 1917. It was expanded in 1947 to meet the need for scientific research in wildlife management and is now a branch of the Department of the Environment.

The CWS conducts scientific research into wildlife problems in the Northwest Territories, the Yukon Territory and the national parks. It advises agencies concerned with wildlife management and co-operates in carrying out recommendations; it advises on and co-ordinates administration of the Game Export Act in the provinces; and it co-operates with agencies in Canada and abroad in dealing with national and international problems related to wildlife resources. As administrator of the Migratory Birds Convention Act, the CWS is responsible for recommending the annual revision of the Migratory Birds Regulations which govern open seasons, bag limits and hunting practices. This it does in consultation with provincial wildlife agencies. Enforcement of the Act and Regulations is carried out by the Royal Canadian Mounted Police, with CWS and provincial co-operation.

The loss of wetlands to drainage and filling for agricultural and other purposes poses a serious threat to waterfowl and, to counteract this, the CWS co-operated with provincial agencies in a major program, started in 1967, to preserve wetlands by purchase and long-term lease. By 1972, 45,000 acres had been bought for \$4 million and 69,000 acres had been leased for \$318,000. The CWS also has charge of 79 bird sanctuaries covering 43,000 sq miles.

The CWS conducts two annual surveys of waterfowl hunters, selected from the 420,000 holders of the Canada migratory game bird hunting permits, to obtain estimates of the species and age of the major waterfowl species taken by hunters. Other continuing projects related to migratory game birds include an annual survey of crop damage in the Prairie Provinces annual surveys of waterfowl populations and habitat conditions in western Canada, a program to reduce hazards caused by birds flying near airports, and a search for a substitute for lead shot which each year causes lead poisoning and subsequent death of a large number of waterfowl. Bird-banding provides valuable information on the migration and the biology of birds, and is especially useful in waterfowl management. The CWS headquarters in Ottawa keeps sets of continental banding records and controls the activities of banders operating in Canada. Much attention has been given to species greatly reduced in number or in danger of extinction. By 1971, 21 eggs were taken from whooping crane breeding grounds and delivered for incubation to the Patuxent Wildlife Research Center in Maryland. Eventually, the progeny from these 21 chicks will be released into the wild but only after a sufficiently large supply of breeding birds has been developed. In 1972, 16 nesting pairs (a record number) laid 29 eggs, but only five chicks reached the wintering grounds. In addition, ten adults disappeared. The causes of these losses are as yet unknown. The total population by December 1972 was 51, a net loss of five from December 1971.

Research was undertaken into the distribution of toxic chemical residues and into the distribution and size of colonies of fish-eating birds in the Great Lakes. The information obtained will enable biologists to assess the extent of factors affecting breeding success and the extent of population changes from the past and to be expected in the future.

Studies continued into the health status and parasites of game and fur-bearing animals and rodents in northern Canada, and into parasites of avian hosts. Measures to control anthrax among bison in Wood Buffalo National Park and in the Northwest Territories were successful; no outbreaks occurred in 1972.

The interpretation program, begun in 1970 with opening of the Wye Marsh Wildlife Centre at Midland, Ont., progressed in 1972 with the construction of centres at Cap Tourmente and Percé in Quebec. The former will focus on the migrant greater snow goose population; the latter will interpret the natural and human history of the Atlantic gulf coast, with special attention to Percé and the nearby sea-bird colonies of Bonaventure Island. Both centres will be in operation in 1973.

The CWS has been participating in the Canada Land Inventory which is a federal-provincial program to gather information on how land in the settled parts of Canada is being used, and how best it could be used for agriculture, forestry, recreation and wildlife.

Research in limnology includes inventory and productivity of lakes and rivers in the national parks and the biology of fish and associated flora and fauna. Adequate stocks of fish are maintained through modern methods of management, where they can be applied without detriment to the values of the areas concerned.

10.4.2 Provincial wildlife management

Newfoundland. The functions of the Newfoundland Wildlife Service are: to maintain all indigenous species from extinction; to provide other species where suitable unused habitat exists, always bearing in mind the real and aesthetic values of wildlife that are important to man; to maintain all species in the greatest number possible, consistent with the habitat needs of the species, without serious conflict with the other resource needs; and, to provide and regulate the harvest surplus of wildlife populations for the use of the people.

The Wildlife Service manages big game almost solely through the manipulation of hunting regulations based on population data gathered from field studies and hunter questionnaires, as well as the transplant of caribou and moose to unoccupied range and the predator controls of lynx around caribou calving grounds. Black bear, the only other big game species, has increased in numbers over the past six years and a trapping program is currently in progress to gain information on their distribution and movements. Research is also being conducted on the ecology and biology of small game species such as snowshoe hare, arctic hare, willow and rock ptarmigan and ruffed grouse. Waterfowl management is conducted by federal authorities.

The wild fur industry in Newfoundland, as elsewhere, has been characterized by short-term instability and a long-term decline. However, recent fur sales have set record prices and this suggests that the decline of the past decade may be temporarily halted. The number of trappers in the province is similar to what it was ten years ago. As a result of this continued interest by trappers, research and management studies are being conducted on all fur bearers. Previously, beaver was the only fur bearer benefiting from a management program. Studies are continuing on the biology of the endangered Newfoundland pine marten. It is hoped that these studies will provide the information necessary to produce the management program required to ensure survival of the species.

Prince Edward Island. The Fish and Wildlife Division of the Environmental Control Commission have full or partial responsibility for research and management of all wildlife on Prince Edward Island. All non-migratory wildlife are the full responsibility of the province while the management responsibilities for fish and migratory birds are shared with the federal government. A prime responsibility is the continual monitoring of game populations to assist in setting seasons and bag limits.

Attempts are being made to establish a viable population of pheasants by the introduction of new species and continued evaluation of their performance. Habitat improvement is of prime importance for all forms of wildlife. Fishery management consists largely of the building of fish ladders to facilitate fish passage and other stream improvement measures such as stream bank stabilization. Habitat improvement for waterfowl consists mainly of flooding marshes for waterfowl production, several projects being jointly undertaken with Ducks Unlimited (Canada). In addition, several wildlife management areas are being developed to allow for special management techniques where required. Fur-bearer management is increasingly important with the red fox being the principal fur bearer on Prince Edward Island.

Land acquisition, primarily marsh and fragile habitat, has assumed a very important role in wildlife management on Prince Edward Island.

Nova Scotia. The Wildlife Division of the Department of Lands and Forests conducts research and management programs, the results of which will help to ensure that the wildlife resource will continue to contribute to the mental, physical and economic well-being of the people of Nova Scotia.

Big game species in the province are undergoing studies to compile annual data on harvest patterns, age and sex ratios, reproduction, behaviour, etc. Wild fur bearers include beaver, muskrat, mink, otter, wildcat, lynx, fox, raccoon and weasel and these provide a supplementary income for some 3,500 persons who harvest wild furs worth from \$100,000 to \$200,000 annually. At present, most attention is directed toward the beaver which is the most valuable fur bearer taken. The Trappers Association of Nova Scotia is organized so that persons closest to the resource may have some say in its wise use and management. One of the aims of the Association is to promote improved marketing and handling of the raw furs taken by trappers so as to upgrade over-all fur quality and thus command more profitable market prices for trappers. Particular emphasis is placed on various forest cutting practices and deer

management where a co-operative program has been developed between a major pulp company and the Department.

Migratory bird management is shared jointly by the Canadian Wildlife Service and the provincial Wildlife Division. Established programs relevant to population inventories, banding, harvest levels, etc., are conducted on an annual basis by the Division. All major waterfowl areas in the province have been carefully evaluated, including the off-shore islands which possess unique ecological features, with the objective of retaining them for the benefit of future generations, and several large waterfowl areas are now owned by the province. The role played by Ducks Unlimited (Canada) has been extremely valuable in establishing a successful program of waterfowl habitat improvement in Nova Scotia. Various techniques are employed annually to determine population levels and other factors of upland game species that are essential in formulating proposals aimed at the wise use and management of the resource.

There are 19 federal and provincial areas in Nova Scotia totalling about 500,000 acres of land and water where wildlife is protected. Among them is the Provincial Wildlife Park at Shubenacadie, where a program of studies relating to parasites and disease and the rearing of wildlife for release is a feature additional to its function as a recreational and educational park. Mention should also be made of the very important role of Acadia University in the provincial wildlife program. Various research programs conducted by that institution and the free exchange of ideas between the two agencies have greatly enhanced the resource management efforts in Nova Scotia.

New Brunswick. Big-game management in New Brunswick is the responsibility of the Department of Natural Resources. Biological studies of white-tailed deer, moose and black bear are carried out each year in an attempt to control the utilization of these valuable wildlife species. Data indicate that the deer, moose and bear populations have improved significantly under the current hunting programs. Fourteen deer environment units form the basis for the deer management program. Studies include aerial censuses of wintering areas to assess the severity of winter and yarding conditions throughout the province.

In 1972, moose management zones were established in an attempt to control the distribution of hunting pressure and moose harvest. Moose licences are restricted to resident hunters and the limited number of licences are awarded at a public drawing. Biological studies indicate that the moose populations have improved in numbers and condition under the current management program. Beaver, muskrat and bobcat are the three most important fur-bearing animals in the province. Each autumn aerial surveys of active beaver colonies are conducted throughout the province to keep a continuing record of population trends.

Grouse, ducks, geese and woodcock are the most important game birds in the province. For each, information is gathered annually on the number of hunters, number of days in the field and the size of the harvest. Several surveys are conducted during the year to determine the well-being of these bird populations. They include population censuses, measures of production and aerial observations of the distribution of waterfowl. Co-operative programs are undertaken on migratory birds with the Canadian Wildlife Service as management responsibilities are shared by both levels of government.

Quebec. The management and protection of wildlife within Quebec is the responsibility of the Fish and Game Branch of the Department of Tourism, Fish and Game. The Branch has two Services, one dealing with wildlife management and the other with conservation. The Wildlife Service is responsible for management, particularly of those species of interest to hunters and fishermen. The work of staff biologists, who are assigned to geographical units known as management districts, includes the collection of precise data on animal populations and habitats in the respective areas. In connection with the management of the fisheries resources, wildlife managers have recourse to the services and resources of the Fish Hatchery Division and the Technology and Engineering Services Division; the former operates six provincial hatcheries, inspects commercial hatcheries, and controls imports of fish eggs and species of salmon brought in for propagation. The Wildlife Service also administers and maintains the Quebec Zoological Gardens. The Conservation Service works closely with the Wildlife and Parks Services and is responsible for enforcing fishing and hunting regulations and for informing the public of the existence of such regulations and of their scope and importance. The Wildlife Conservation Act, which came into force in December 1969, is intended to protect fish and wild animal species within the province.

Ontario. The objective of wildlife management programs in Ontario is to maximize the benefits of the wildlife resource to the residents of the province by providing high-quality recreational opportunities for hunting and viewing and by providing economic returns.

The two most important factors limiting deer numbers are the deterioration of the range and a series of severe winters. The deterioration of the range is caused by a current lengthy pause in logging and by the elimination of large fires in the last few decades, so that the vegetation needed for winter food is allowed to grow too tall for deer-browsing. Many recent winters, including the last four, were too severe for many deer to survive until the next summer or to successfully raise their young. An important aspect of the management program is the improvement and increase of existing winter range. Moose management is concentrated on intensive production and harvest inventory and evaluation of the effect of various forest practices on moose range. Ultimately, moose range and forest management will be integrated in such a way as to optimize both fibre and moose production.

Upland wildlife management programs pertain to populations of smaller animals and include habitat management on private lands through extension programs and by agreement, as well as on Crown lands. Waterfowl banding is important in developing a reasonable management program for an international resource. Re-establishment of a breeding population of the giant Canada goose in southern Ontario is a specialized part of the Ontario migratory bird program.

The wildlife management areas that have been established provide opportunities for nature study and hunting in southern Ontario, where virtually all lands are privately owned. Their existence also ensures preservation of valuable wetlands.

Increased effort is being directed to management of beaver populations in the province because of their value to some 10,000 trappers and the impact of their activities on the environment.

Some 7,000 beaver specimens were collected and analyzed during the last three years and hundreds of traplines were surveyed by air to locate beaver colonies. Monthly summaries of fur bearers taken by each trapper are now prepared through a computer program. Expansion of the use of computer data will help to provide population dynamics information, habitat evaluation and pelt priming information for use in management of the resource. The harvest of beaver, marten, and fisher is controlled by quota. On Crown lands there are some 2,300 registered traplines on which professional trappers, with assistance from specialists of the Ministry of Natural Resources, practise wildlife management not unlike animal husbandry. An increasing number of trappers engage in habitat improvements, such as planting aspen for beaver, and in feeding marten, fisher and other wildlife on their areas.

Returns to trappers from the fur harvest in 1971-72 were about \$4 million. Recent surveys indicate that many trappers, especially those in northern Ontario, also depend on the meat from certain fur bearers to supplement their family food supplies.

Staff of the Ministry of Natural Resources, with the co-operation of the Ontario Trapper's Association, conduct over one hundred trappers' meetings annually where new and humane trapping techniques are introduced and discussed, pelt preparation is demonstrated, and animal biology and management practices are taught. The Ministry also encourages use of the humane conibear trap through an exchange of traps for beaver biological material necessary for the best management of this fur bearer. About three quarters of the fur produced is sold through the Ontario Trapper's Association auction house at North Bay.

Manitoba. The Manitoba Department of Mines, Resources and Environmental Management is responsible for the management and conservation of the province's wildlife resources. Authority provided by provincial legislation (the Wildlife Act, the Predator Control Act and Regulations) allows for legal protection and management of 25 mammals, 160 birds and two reptiles that occur in the province. The Federal Migratory Birds Convention Act deals with the protection of migratory game birds, migratory insectivorous birds and migratory non-game birds. In September 1971, Manitoba became the first province to regulate the commercial harvest of amphibians and reptiles. Research and management of this resource continue.

The Department is made up of five Divisions (Mines and Departmental Services, Environmental Management, Resources Management, Water Resources and Technical Services), each responsible for one or more aspects of wildlife research and management.

Wildlife authorities manage over 50 game hunting areas, 40 trapping areas, 30 wildlife, game bird, goose and fur-bearing animal refuges and 24 wildlife management areas. The

distribution of hunting and trapping pressure by setting definite seasons and bag limits is one of the major management tools utilized. Considerable effort is also being directed toward wildlife habitat acquisition and development.

Saskatchewan. Management of the province's wildlife resource is administered by the Fisheries and Wildlife Branch of the Department of Natural Resources. Legislative authority is provided through the Game Act and the Fur Act. The objective of the Department's wildlife management program is to provide maximum viewing, recreational hunting and commercial fur harvesting opportunities to residents of the province, compatible with the wildlife resource and its habitat. To achieve this objective, the Branch administers a wildlife research and management program. Research projects are undertaken to determine production of the most important wildlife species; determine habitat conditions for wildlife; investigate effects of land use practices on the wildlife resource; study limiting factors of some wildlife populations; determine diseases of certain wildlife species and their relative importance on wildlife populations; and develop techniques which will facilitate the maximum utilization of the wildlife resource on a sustained-yield basis. Thus, the Wildlife Research Unit is able to provide basic information on the resource to the Game Administrative, Game Surveys and Fur Units who then have the responsibility to develop and implement the necessary development programs.

Reduction of wildlife habitat, a result of intensive agricultural practices, is at present a major concern. A Wildlife Development Fund has been established. It is financed from game licences which provide approximately \$230,000 annually for the acquisition, development and improvement of wildlife lands. A Game Advisory Committee, having representation from various interest groups, is consulted yearly on proposed game seasons, bag limits and management programs.

Alberta. The conservation and management of wildlife resources in Alberta are under the jurisdiction of the Fish and Wildlife Division of the Department of Lands and Forests. The Division initiated several new research projects in 1972: the determination of the condition of whitefish in Lesser Slave Lake; testing experimental techniques, other than by gill-nets, to improve harvesting efficiency; studies of the walleye population in the Athabasca Delta; and the evaluation of stream management projects.

Construction proceeded on a new fish hatchery in Calgary to replace a hatchery formerly located on private property.

A Habitat Protection and Development Section was formed setting conditions on development applications for mines, highways, exploration, etc. A Wildlife Habitat Protection and Development program assembled a map to indicate prime and winter ranges for ungulates and key production and staging areas for waterfowl. A number of habitat development projects were initiated, including controlled burning of elk range for higher forage production, creation of pheasant habitat and a waterfowl area. Research projects continued on pheasants, geese, deer and sheep.

The Division entered into a program to reduce the frequency of night-lighting in certain regions of the province. The use of aircraft at night was incorporated into the program and has proved to be effective in this special area of enforcement work. A study to assess the white-tailed deer population response to season closure and saturation enforcement control was continued for the second year. A research program has been initiated to develop a method of positive identification of meat samples by species.

British Columbia. The Fish and Wildlife Branch of the Department of Recreation and Conservation is responsible for the protection, enhancement and wise use of the wildlife and freshwater fish resources of British Columbia. Administrative and technical headquarters are in Victoria, with six regional headquarters in the main centres of population, as well as 44 district offices, three fish hatcheries and a number of permanent field stations throughout the province.

The Branch promotes the wise and orderly use of upland birds, game animals and sport fish by licensing hunters and anglers and by determining and enforcing closed seasons, bag limits and other regulatory measures. It licenses and regulates the trapping of fur-bearing animals, the commercial propagation of game birds and fish, the activities of big-game guides and generally acts as manager of the province's wildlife.

Through close contact and liaison with other government agencies and with private concerns involved in mining, forestry, agriculture, water use and transportation, the Branch actively fosters the preservation of a suitable land and water environment for wildlife and outdoor recreation.

The Branch enhances the abundance and health of desirable species of animals by the acquisition of key areas of range for big game and waterfowl, by the operation of fish hatcheries and the stocking of lakes and by improving habitat for both fish and wildlife. To increase the understanding of the wildlife resource and to provide a proper basis for wise management, the Branch conducts and supports considerable fundamental and applied research on fish and wildlife and their environment.

The Branch's objective is to make a significant contribution to the economy and well-being of British Columbia through wise management of game resources and of non-tidal fisheries. It attempts to maintain British Columbia's waters and lands in a state of continuing productivity through attention to such major matters as pollution and land use, and encourages planned or integrated use of lands for forestry, agriculture and wildlife. The Branch also creates public awareness, through programs of education and information, of the values of wildlife resources and of the principles of wise management; protects the resource from unlawful and indiscriminate use and waste; and furthers the rights of the public as a consumer of the wildlife resource.

Chapter 11

Agriculture

11.1 Trends and highlights, 1972

The year began on an encouraging note with the announcement by the federal government of record-breaking agricultural sales in 1971. Exports totalled \$1,984 million, with wheat, rapeseed and barley the leading commodities.

On January 1, the United States eliminated tariffs against a number of agricultural products including fresh apples, maple syrup and sugar, turnips, cattle hides, sheep and lambs, and fruit-tree seedlings, allowing about 30% of Canada's agricultural exports into that country duty free compared with 20% under previous regulations.

The first permits for the import of cattle from Australia were issued to 75 applicants, and 246 cattle — Murray Grays and Australian Shorthorns — arrived at Edmonton International Airport on August 2 where they remained in quarantine until mid-October. Permits were also granted to 613 applicants to import 911 cattle from Europe.

The Minister of Agriculture pledged Canada to a contribution of \$34 million to the World Food Programme. The pledge, \$4 million higher than the previous commitment, was for two years; since the program started in 1962, Canada has ranked second among contributing countries.

The National Farm Products Marketing Council was appointed in March to oversee the establishment and operation of national marketing agencies for various farm commodities. Public hearings into the establishment of a national egg marketing agency were held in Ottawa, Moncton and Calgary in September.

Project 75, a new federal approach to agricultural co-ordination and development based on a market-oriented concept, began early in the year. The project concentrated on beef, oilseeds and high-energy grains and involved consultation, analysis and co-ordination of the various segments of the commodity systems. Before the end of the year, Project 75 had evolved into a new branch within the Department, known officially as the Food Systems Branch.

New regulations for labelling pesticides came into effect November 25 under the Pest Control Products Act, providing authority to classify pest control products as either domestic or commercial so that they can be more easily channelled through the marketplace to qualified users. In addition to being thoroughly tested before they can be registered, pesticides will now be classified according to standards of safety to humans and to potential effects on wildlife and the environment. The sale of potent products may be restricted to authorized persons to ensure safe use.

In mid-February, the Minister of Agriculture announced the implementation of the Small Farm Development Program on a national scale and by the end of 1972 six provinces — Alberta, Ontario, British Columbia, New Brunswick, Prince Edward Island and Nova Scotia — had signed agreements with the federal government. Under these agreements the Department, jointly with provincial departments of agriculture, provides farm management and counselling services to participating farmers, and extends credit to small farm operators to purchase the land required to develop a profitable business.

Bill C-5, amending the Farm Credit Corporation Act, received Royal Assent July 11. The most significant changes were an increase in the loan ceiling for individual operators, removal of the minimum age of 21 years as a qualification for a loan and restriction of loans to Canadian citizens and landed immigrants.

Federal assistance was given to farmers in Ontario and Quebec whose crops were damaged by flooding. The assistance included \$400 cash grants to individual farmers in wet-damaged areas, and loans, fodder subsidies and subsidies on cattle feeds.

About 11,000 wheat producers in eastern Canada received cheques in September to cover benefits under the federal government's two-price wheat payment system. Total payments exceeded \$5 million, individual payments averaging \$350.

Five new wheat grades were introduced on August 1. The new grades of bread wheat varieties are No. 2 Western Red Spring Wheat, which replaces No. 3 Northern and a small part of No. 4 Northern; and No. 3 Western Red Spring Wheat, which replaces the bulk of No. 4 Northern, No. 5 wheat and all Garnet grades. The new utility grades are No. 1 Canada Utility

and No. 2 Canada Utility, which include feed and non-bread varieties, and No. 3 Canada Utility which includes the former No. 6 and Feed wheat. Canada No. 1 Western Red Spring Wheat, which replaced No. 1 Hard and No. 1 Northern and No. 2 Northern, was introduced in 1971.

A beef carcass appraisal service was instituted to identify animals at slaughter and, for the first time, to relay carcass information back to the producers of feeder calves and finished cattle. A new beef grading system was implemented on September 5, introducing a more precise system of measurement for quality and quantity in a carcass.

A nation-wide cattle blood-typing service at a nominal charge was announced; tests are performed at the Health of Animals Branch pathology laboratory at Guelph, Ont.

A program was implemented during the year to reduce the Canadian laying flock in order to lower the egg surplus that was disrupting marketing channels. Payments based on the slaughter of one million hens within eight weeks were made, and a higher assistance rate paid if slaughtering took place before the end of the period. The program ended successfully June 27 with producer prices strengthening.

An immunizing vaccine for Venezuelan Equine Encephalomyelitis — a serious virus disease affecting the central nervous system of horses — became available May 1. The federal government also offered to pay compensation to horse owners who have their animals destroyed under the program to eliminate equine infectious anemia (swamp fever).

On August 14, the Ministers of Agriculture and Health announced the suspension, effective January 1, 1973, of the use of DES (diethylstilbestrol) to promote growth in livestock, after studying a report from an advisory committee of non-governmental experts which indicated that, although there is no evidence that DES has harmed the health of Canadians, there is potential for harm. The suspension followed a phasing out of the use of the hormone announced by the US Department of Health, Education and Welfare on August 3. A final decision on the status of DES will be made after further experimentation.

Dairy producers in Alberta, Saskatchewan and Manitoba entered the Market Sharing Quota Program during the year, joining Prince Edward Island, Ontario and Quebec in the scheme. With the addition of these provinces, more than 95% of the milk and cream used in manufactured dairy products in Canada came under market-sharing quotas.

The Canada Sheep Marketing Council was formed by representatives of lamb, wool and sheep associations across Canada. The Council will provide co-ordination of marketing efforts to industry and will recommend changes to improve returns to sheep producers.

A calf, believed to be the first born in Canada following the transfer of a fertilized egg from one cow to another (ovum transfer), was born May 9 at the Agriculture Canada farm near Hull, Que. The donor cow and foster mother were Holsteins; the sire was an Aberdeen Angus.

The Canada Department of Agriculture won a major international award at the Fifth International Food Products Exhibition in Paris, France, for a new process for producing quick-frozen egg mélange. By this process droplets of pasteurized egg mélange are frozen in liquid nitrogen, resulting in a granular form called cryogran eggs that overcomes the problems of handling the conventional 40-lb. bulk lots.

11.2 Federal government services

The Canada Department of Agriculture dates from Confederation in 1867. It was established as an outgrowth of the Province of Canada's Bureau of Agriculture, which was set up in 1852. The Department's authority lies in the British North America Act, 1867, which states, in part, "in each province, the legislature may make laws in relation to agriculture in the province" and "the Parliament of Canada may from time to time make laws in relation to agriculture in all or any of the provinces; and any law of the legislature of a province relative to agriculture, shall have effect in and for the province as long and as far as it is not repugnant to any Act of the Parliament of Canada".

A Department of Agriculture with a Minister of Agriculture at its head was accordingly established as part of the Government of Canada, and departments of agriculture headed by provincial Ministers were also set up by the provincial governments. In the Yukon Territory and Northwest Territories, agriculture is of very minor importance.

11.2.1 Canada Department of Agriculture

Activities of the Canada Department of Agriculture (CDA) cover three broad areas: research, promotional and regulatory services, and assistance programs. Research aims at

solving practical farm problems by applying fundamental scientific research to all aspects of soil management, agricultural engineering, and crop and animal production. Promotional and regulatory services attempt to control and eradicate crop and livestock pests, and register chemicals and other materials used for these purposes. Also included are inspection and grading of agricultural products and the establishment of crop and livestock improvement policies. Assistance programs cover some of the sphere of price stability, emergency relief, crop insurance, compensation, and income security in the event of crop failure.

The Department has seven branches: Research, Production and Marketing, Health of Animals, Economics, Food Systems, Financial and Administration, and Personnel Administration. Its organization also includes the Canadian Grain Commission, Agricultural Stabilization Board, Agricultural Products Board, Crop Insurance Division and Prairie Farm Assistance Administration. In addition, there are a number of agencies that are independent of, but closely allied with, the Department and are responsible to the Minister of Agriculture. These include the Canadian Dairy Commission, the Canadian Livestock Feed Board, the Farm Credit Corporation and the National Farm Products Marketing Council.

The Research Branch is responsible for research on agricultural production problems although some phases of research are carried on by the Economics Branch, the Health of Animals Branch and the Grain Research Laboratory of the Canadian Grain Commission. The activities of the Branch are carried out at 25 Research Stations, 10 Experimental Farms, seven Research Institutes, two Research Services, and at a number of substations and project farms in all ten provinces. General direction and co-ordination of the program are provided by headquarters of the Branch, located in Ottawa. Approximately 800 professional staff are employed, representing all the biological and physical sciences that contribute to the solution of agricultural production problems.

The total program of the Branch is problem-oriented, with specific objectives and goals for the Branch as a whole and relevant objectives and goals for each establishment. With the increasing complexity of modern agricultural production and the competitive pressures that exist, efficiency and reduced cost per unit of production become increasingly important. Therefore, emphasis in the research program continues to be on development of improved varieties of plants and animals, on production practices that will maximize yields and reduce costs, and on methods of controlling insects, diseases and weeds that lower production.

Through the years, Research Branch scientists have produced new varieties of cereal, forage and horticultural crops to meet new market requirements and reduce the hazards of production. The search continues for even better material to overcome the limiting factors of a northern climate including a short growing season, frost hazards, drought, insect pests and diseases. At the same time, efforts are being made to develop plants that will respond favourably to long days and the high light-intensity of many parts of Canada. As an aid in identifying the effects of climate on crops and providing a basis for forecasting the possibilities of success with new crops in a given area, agrometeorology has become increasingly important. Particular attention is focused on new crops and outstanding success has been achieved; a highlight is the development of new varieties of rapeseed with oil quality-tailored to specification. More than 80 new varieties of crops have been developed and put into commercial production in the past ten years, including almost all of the cereal crops produced in western Canada.

Feed grains and forage crops are receiving special attention for economical livestock production. The application of genetics to animal improvement and strengthening of the knowledge of the nutritional requirements of animals are the two main avenues being explored to improve livestock production. More recently, increasing emphasis has been placed on developing procedures to improve the reproductive efficiency of all classes of stock. Additional attention is also being given to the disposal of animal wastes, a problem that is increasing in severity as livestock concentrations become larger.

An aggressive battle is being fought to control crop diseases and pests. Although chemicals have proved to be a potent weapon, their contribution to the total pollution problem has caused particular concern and other methods of control are now receiving greater attention. The development of resistant varieties, the use of parasites, predators, insect pheromones, and radiation-induced sterility and the destruction of insects by non-chemical means are all in the arsenal of research workers. In this, as in most other aspects of agricultural research, the team or inter-disciplinary approach is being used more and more.

Agriculture has made outstanding advances in the past quarter-century in increasing output per man. This has been made possible through farm mechanization on a large scale. To assist this advance, the Research Branch has expanded its agricultural engineering staff to deal with specific problems and to provide more liaison with universities and provincial extension officers. The Branch conducts a continuing soil survey in all provinces in co-operation with provincial departments of agriculture and with faculties of agriculture in universities; it also conducts an extensive program of research on soil fertility and cultural practices, with a view to using agricultural soils most effectively and conserving them for the future.

In addition to research done by Branch staff, considerable co-operative work is undertaken with staff of university faculties and provincial governments. Through operating and extramural grants, support is given to research workers at universities. Close liaison is maintained with these agencies to avoid unnecessary duplication of programs and special attention is given to maintaining contact with provincial extension officers. Branch establishments across the country are represented on provincial committees concerned with making recommendations on crop varieties, fertilizers, cultural practices, pest control, animal management, and other problems. Such collaboration ensures that research results are made available to extension officers and to producers as quickly as possible.

The Production and Marketing Branch conducts many of the promotional and regulatory functions of the Department. Six specialized divisions administer legislation and policies in the production and marketing of livestock, poultry, fruits and vegetables, dairy and plant products, and policies concerned with the control of disease in plants.

The Livestock Division administers legislation dealing with the grading of meat, wool and fur, with the registration of livestock pedigrees, with performance testing of cattle and hogs and with the supervision of race-track betting. Other activities include the promotion of livestock improvement and the compilation of market statistics. The Poultry Division carries out the policies of the national poultry breeding program, including Record of Performance for poultry, and hatchery inspection, as well as administering the regulations for the grading of poultry products. The Fruit and Vegetable Division administers legislation having to do with the grading of fruit and vegetables in both fresh and processed form, maple products and honey; it is also responsible for the licensing of interprovincial and international dealers and brokers who deal in fresh fruit and vegetables.

The Dairy Division administers legislation covering grades and standards for dairy products, including butter, cheese, concentrated milk products and ice cream. The Plant Products Division administers Acts and Regulations respecting seeds, feeds, fertilizers and pest-control products, conducts field inspections of seeds and maintains regional testing laboratories for agricultural product samples taken by Branch inspectors. The Plant Protection Division is responsible, under the Destructive Insect and Pest Act, for safeguarding against the introduction of serious plant insects or diseases into Canada or their spread in Canada, for certifying freedom from disease and pests in plant exports, and for seed potato certification. Other organizational units include the Grains Division, responsible for cereal grains and special crops, and the Marketing and Food Advisory services.

The Health of Animals Branch administers the Animal Contagious Diseases Act, the Meat Inspection Act and the Humane Slaughter of Food Animals Act, and operates laboratories for the study of animal diseases. It is composed of four Divisions: Contagious Diseases, Meat Inspection, Animal Pathology, and Education and Development. The Contagious Diseases Division controls contagious diseases of animals through preventive measures of inspection and quarantine of imported livestock and restricted commodities such as meat, farm products and other possible sources of infection; through conducting disease eradication programs, notably of bovine tuberculosis, brucellosis and Johne's disease; through the control and eradication of serious animal diseases, such as Newcastle disease, hog cholera, rabies and anthrax when outbreaks occur; and through inspection and certification as to health of livestock for export. The Meat Inspection Division conducts antemortem examinations; ensures the application of strict humane slaughter regulations for all food animals; conducts continuous postmortem examinations of animals slaughtered at packing plants operating under the Meat Inspection Act; and ensures maintenance of sanitary standards during processing of the products, accurate labelling, and the proper kind and use of ingredients and preservatives, in order that only wholesome, unadulterated meats and meat food products will be marketed.

The Animal Pathology Division consists of the Animal Diseases Research Institute at Hull, Que., the Animal Diseases Research Institute (Western) at Lethbridge, Alta., and seven other laboratories which conduct research and investigations on diseases of animals. The Division produces the biological products required in the control programs of the Branch; provides diagnostic services for diseases of domestic and wild animals; offers a consultation service regarding veterinary biologics and other agents used in the control of animal diseases; and assists in training departmental officers and technicians, as well as veterinarians from other lands. The Education and Development Division provides comprehensive training programs to meet the technical and scientific needs of the Branch and sponsors the attendance of its officers on other courses, and is involved in recruitment and liaison with other educational and professional institutions and organizations.

The Economics Branch furnishes the social science component, primarily economics, essential for the provision of comprehensive policies and programs to develop the agriculture and food sector of the Canadian economy. The Branch provides economic analysis and consulting services for the Minister, the Department and federal agencies. It conducts economic research, projects trends and prospects for agriculture, disseminates economic information, analyzes policy proposals, and plans and operates national economic programs for agriculture.

The structure of the Economics Branch is as follows: the Director General and Branch Executive, the Program Coordination and Development Group, the Policy Advisory Group and five divisions. The Marketing and Trade Division is concerned with the efficiency and development of markets for Canadian farm products; it also advises on trade policies and problems and prepares agricultural economic outlook information. The Farm and Rural Development Division helps Canadian farmers maintain profitable operations, keeps in touch with the problems of rural communities and operates the Small Farm Development Program. CANFARM Division provides a national computerized farm accounting service. The Research Division investigates the economics of production, marketing and resource use in agriculture and forecasts economic trends. There is also an Administration Division. Four regional research offices serve the following areas: the Maritime Provinces, Quebec, the Prairie Provinces and British Columbia; the CANFARM offices are at Guelph.

The Food Systems Branch was established in late 1972 to develop market-oriented plans for various commodities through the planning, development and co-ordination of programs within the Canada Department of Agriculture and with other components of the food system. The Branch works with all segments of the food industry, including producers, processors and distributors. Its responsibilities include monitoring and assessing food systems programs.

Administration, liaison and information. The Financial and Administration Branch provides central advisory and specialized staff services for the financial and business management of the Department and advises the Senior Executive in developing financial and administrative policies and programs. Personnel policies and programs for approximately 10,000 employees of the Department, including scientific and professional groups, technical, administrative and other support staff at various locations across Canada, are conducted by the Personnel Administration Branch.

The International Liaison Service, established in 1969, is the Department's "foreign affairs" arm. It maintains liaison on behalf of the Department with international agencies such as the Food and Agriculture Organization, the Organization for Economic Co-operation and Development and the World Food Programme. The Service co-ordinates departmental participation in these organizations, and in aid and development programs undertaken by the Canadian International Development Agency, the International Development Research Centre and international foundations. It also reports regularly on agriculture policy trends abroad and evaluates the impact of these changes on Canadian agriculture and trade.

The Information Division gathers and disseminates information on the research, development and regulatory work of the Department, giving service to the news media, to agricultural extension workers and directly to the public through publications, press and radio releases, television material, motion pictures and exhibits.

11.2.2 Farm assistance programs

Basic to the concept of Canada's national agricultural policy is the premise that a stable agriculture is in the interests of the national economy and that farmers as a group are entitled

to a fair share of the national income. Consequently, the Canada Department of Agriculture has carried on long-term programs designed to aid agriculture through the application of scientific research and the encouragement of improved methods of production and marketing. Over the years, as conditions have warranted, programs have been initiated to deal with special situations such as mitigating the effects of crop failure, assisting the movement of western feed grains to eastern Canada and British Columbia, reclaiming soil in the Maritime Provinces and combating drought in the agricultural areas of Manitoba, Saskatchewan and Alberta.

Although much has been accomplished and is still being accomplished by these measures, changes in the past two decades have dictated the need for a different approach to some problems. Large-scale mechanization and, in some segments of the industry, automation, have reduced manpower requirements very significantly; the number of farms has declined but the size of farms has increased; marketing and income problems have taken different forms; and a decline in some rural communities has occurred together with problems of increasing regional disparity. Legislation enacted to meet these situations includes price support (Agricultural Stabilization Act), dairy market and producer income stabilization (Canadian Dairy Commission Act), crop insurance (Crop Insurance Act), feed grain assistance (Livestock Feed Assistance Act), credit facilities (Farm Credit Act, Farm Syndicates Credit Act, Farm Improvement Loans Act), marketing assistance (Canada Grain Act, Agricultural Products Board Act, National Farm Products Marketing Council) and other forms of assistance to meet emergency or long-term conditions (Prairie Farm Assistance Act, Prairie Grain Advance Payments Act, Agricultural and Rural Development Act and Prairie Farm Rehabilitation Act). All these measures are administered by the Canada Department of Agriculture or by organizations responsible to the Minister except the Farm Improvement Loans Act (Department of Finance), Prairie Grain Advance Payments Act (Department of Industry, Trade and Commerce) and the ARDA and PFRA programs (Department of Regional Economic Expansion).

The Canadian Grain Commission was established in 1971 under the Canada Grain Act replacing the former Board of Grain Commissioners for Canada. For more detailed information on this Commission see Section 11.8.1.2.

The Agricultural Stabilization Board, established in 1958 by the Agricultural Stabilization Act which at the same time repealed the Agricultural Prices Support Act, 1944, is empowered to stabilize the prices of agricultural products in order to assist the agricultural industry in realizing fair returns for labour and investment, and to maintain a fair relationship between prices received by farmers and the costs of goods and services that they buy.

The Act provides that, for each production year, the Board must support, at not less than 80% of the previous ten-year average market or base price, the prices of nine commodities: cattle, hogs and sheep; butter, cheese and eggs; and wheat, oats and barley produced outside the prairie areas as defined in the Canadian Wheat Board Act. Other commodities may be supported at such percentage of the base price as may be approved by the Governor in Council. Since the Act came into force, the following farm products, other than the nine named commodities, have been supported at one time or another: honey, potatoes, soybeans, sunflower seeds, sugar beets, apples, peaches, wool, fowl, blueberries, rutabagas, carrots, sour cherries, raspberries, asparagus, tomatoes, milk for manufacturing, casein, cream, fluid milk, fluid cream, and skim milk powder. The Board may stabilize the price of any product by an offer-to-purchase, by a deficiency payment, or by making such payment for the benefit of producers as may be authorized.

In stabilizing prices of certain commodities by means of assistance payments, the price stabilization program has been assisting the agricultural industry to make production adjustments from a position of excessive supply to one of more normal relationship between supply and demand. During the period of adjustment, the Board guarantees a minimum average return to producers for their product on a national average basis.

The cost of stabilization programs under the Act has averaged approximately \$85.5 million a year. The Board has available a revolving fund of \$250 million, according to the Act; losses incurred are made up by Parliamentary appropriations and any surplus is paid back to the Consolidated Revenue Fund. An advisory committee named by the Minister of Agriculture and composed of farmers or representatives of farm organizations assists the Board in its operations.

The Agricultural Products Board was established in 1951 to administer contracts with other countries for the purchase or sale of agricultural products and to perform other commodity operations as Canadian needs may dictate. The Board's recent activities have included the purchasing of surplus Canadian commodities such as eggs and turkeys, with resulting improvement in producer prices, to be processed, packaged and delivered to the World Food Programme as part of Canada's commitment to that organization.

The Crop Insurance Act was passed in 1959 (RSC 1970, c.C-36) to assist in making the benefits of insurance protection on crops available in all provinces. This Act does not set up any specific insurance scheme but rather permits the federal government to assist the provinces to do so by making direct contributions toward the cost of providing crop insurance. The initiative for establishing schemes to meet their own regional requirements rests with the provinces. Schemes may be organized on the basis of specific crops or areas within the provinces and agreements between the provinces and the federal government set out the terms of insurance coverage.

Under the Act and amendments of 1964, 1966 and 1971, the federal government will pay 50% of the administrative costs incurred by a province and 25% of the amount of premiums required to make the scheme actuarially sound. In addition, the federal government may make loans to any province equal to 75% of the amount by which indemnities required to be paid under policies of insurance exceed the aggregate of the premium receipts for that year, the reserve for the payment of indemnities, and \$200,000. As an alternative to such loans, the federal government may re-insure a major portion of the provincial risk in a program operated under the Crop Insurance Act. Farmers insured under the Act are not eligible for payments under the Prairie Farm Assistance Act, nor are they required to pay the 1% levy on grain sales as provided for under that Act.

In the year ended March 31, 1972, 46,325 farmers purchased insurance worth \$131.5 million under 89 different crop insurance plans. Premiums charged totalled \$9.7 million (including the federal share) and indemnities paid out were approximately \$7.8 million compared with \$6.8 million in 1970. The number of farmers who purchased crop insurance in 1971 was 13% less than in 1970, but the insurance coverage was 12% more than in 1970. The main reduction in numbers of participating farmers occurred in Alberta, Saskatchewan and Quebec. The wheat inventory reduction program instituted in 1970 carried through to 1971 with the introduction of the Grassland Incentive Program and this may account for decreases in farmer participation in Alberta and Saskatchewan where wheat is the main crop; participation was lower in Quebec because of administrative difficulties. In 1971, crops were generally average across Canada. Major crop losses occurred in specific areas of Canada due to a variety of causes, such as fruit-set failure in apples in the Okanagan Valley of British Columbia, hailstorms and excess moisture during the harvest period in the prairie grain area, excess moisture during harvest in Ontario, mid-season drought in Quebec, and a late spring and wind and rain during August from Hurricane Beth in Nova Scotia and Prince Edward Island.

The Prairie Farm Assistance Act, 1939 (RSC 1970, c.P-16) provides for direct cash payments by the federal government on an acreage-and-yield basis to farmers in areas of low crop yield in the Prairie Provinces and in the Peace River area of British Columbia. Its purpose is to assist in dealing with a relief problem that faces municipalities when widespread crop disasters reduce crop yields over a large area. The per-acre payments are intended to assist farmers to seed a crop in the following year. Payments for the year ended March 31, 1972 totalled nearly \$5 million.

Payments are made from the Prairie Farm Emergency Fund to which farmers contribute 1% of the value of all sales of wheat, oats, barley, rye, flaxseed and rapeseed. In the period 1939 to 1972, receipts from the levy totalled \$215.6 million while payments to farmers were \$393.2 million. The additional funds required were provided from the federal treasury. Since August 1, 1971 the 1% levy on grain sales has been discontinued by authority of the Governor in Council as part of the progressive phase out of this program. The balance in the Prairie Farm Emergency Fund at April 1, 1972 was \$14.4 million.

Farmers operating land in the spring wheat area, and not covered by a federal-provincial crop insurance scheme, are eligible for awards. Crop failure and natural causes preventing seeding and summerfallowing are taken into account in making awards. These may not exceed

\$800 in respect of any one farmer's total cultivated acreage.

The Prairie Farm Assistance Administration was responsible for making payments under the Grassland Incentive Program in 1971-72. This is a forage program offering an incentive of \$10 per acre to farmers who change their farm production from grains, oilseeds and other crops to perennial forage. Payments made to farmers under the program to March 31, 1972 amounted to \$9.8 million. In addition, the Prairie Farm Assistance Administration made payments to farmers of approximately \$5.4 million in 1971-72 under the Operation LIFT program of 1970. Total payments under the LIFT program amounted to \$63.3 million as at March 31, 1972.

The Canadian Dairy Commission was established by the Canadian Dairy Commission Act and became operative on April 1, 1967. The affairs of the Commission are directed by three Commissioners, and its objects are "to provide efficient producers of milk and cream with the opportunity of obtaining a fair return for their labour and investment and to provide consumers of dairy products with a continuous and adequate supply of dairy products of high quality".

To perform its functions, the Commission is authorized to stabilize prices of major dairy products through offers to purchase at fixed prices, thus establishing stable prices in the interests of both producers and consumers. The Commission may borrow from the Minister of Finance the funds required for such purchases to a maximum of \$100 million, which must be repaid.

The Commission administers the payment of funds provided by the government for subsidies to producers of milk and cream used in the production of dairy products. These payments supplement returns to producers from the market and permit market prices to be kept at reasonable levels. Each producer is given a quota for the amount for which he is eligible for subsidy. The Commission, indirectly, pools returns to producers from products sold on the domestic and export markets through an export equalization fund. Money for this is collected by levies from producers in provinces under the Market Sharing Quota Program — Prince Edward Island, Quebec, Ontario, Manitoba, Saskatchewan and Alberta — and remitted to the Commission; in other provinces the money is collected by means of a holdback from subsidy payments. The funds are used to equalize export prices with domestic prices, for any surplus products that must be exported below domestic prices. Further details on the activities of the Commission with regard to marketing may be found in Section 11.8.2.2.

The Livestock Feed Assistance Act established the Canadian Livestock Feed Board, which is a Crown agency reporting to Parliament through the Minister of Agriculture. The Board has four main objectives: to ensure that feed grain is available to meet the needs of livestock feeders; that adequate storage space in eastern Canada is available for feed grain to meet the needs of livestock feeders; that the price of feed grain in eastern Canada and in British Columbia remains reasonably stable; and that there be fair equalization of feed grain prices in eastern Canada and in British Columbia.

To these ends, the Board may make payments related to the cost of feed grain storage and transportation. Feed grain transportation assistance payments have been made since 1941; since April 1967 they have been made under the authority of the Livestock Feed Assistance Act. Under the Feed Grain Assistance Regulations of the Appropriations Act, the original policy was initiated in October 1941 to provide a market for western feed grains, and to enable livestock feeders in eastern Canada and British Columbia to obtain supplies of feed grains at a cost that would maintain livestock and poultry production at a high level. This program has been modified over the years to encourage better utilization of both transport and storage facilities.

In the year ended March 31, 1972, more than 2.9 million tons of feed grain were shipped at a cost of \$20.2 million. Barley shipments made up more than 30% of the total, followed by western wheat and sample feed grains which accounted for 27%, oats nearly 20% and mill feeds about 15%. Small quantities of rye, western corn, screenings, and eastern corn and wheat made up the remainder. About half the shipments of each of the major grains went to Quebec, followed in order by Ontario, British Columbia and Nova Scotia.

The Farm Credit Corporation was established in 1959 as successor to the Canadian Farm Loan Board set up in 1929. The Corporation, which is a Crown agency, reports to Parliament through the Minister of Agriculture.

Two types of long-term mortgage loans are available under the Farm Credit Act. Under Part II, loans may be made up to 75% of the appraised farm value not exceeding \$100,000 for any farmer alone or jointly with others in a single farming business. Under Part III, supervised loans may be made to young farmers up to 75% of the appraised value of land and chattels, not exceeding \$100,000 for any farmer alone or jointly with others in a single farming business; special provision is made under this Part for loans up to 90% of farm assets where the owner-operator is under 35 years of age and management will be considerably above average. Under both Parts, applicants must be principally occupied in farming and be of legal age to enter into a mortgage agreement. Individual applicants under Part III must be less than 45 years of age. Loans may be made only to Canadian citizens or those with landed immigrant status. The interest rate is set by Order in Council and varies with the cost of money to the Corporation. The repayment period for both Parts is up to 30 years.

The Corporation has 115 field offices at which are based 191 credit advisers responsible for informing local farmers about the services available, for pre-loan counselling on credit use, farm planning and farm management, for accepting applications and for making farm appraisals.

In addition to the amounts repaid by borrowers, funds for lending to farmers may be borrowed by the Corporation from the Minister of Finance. The aggregate amount of such borrowings outstanding at any time may not exceed 25 times the capital of the Corporation. This capital was raised by amendment to the Act in 1972 from \$56 million to \$66 million. There were 68,930 loans to the amount of \$1,200 million outstanding as at March 31, 1972. During the 1971-72 fiscal year the Corporation approved 4,035 loans for \$114.7 million.

The Farm Syndicates Credit Act authorizes the Farm Credit Corporation to lend to qualified groups of farmers (referred to as syndicates). A syndicate is a group of three or more farmers, the majority of whom have farming as their principal occupation, who have signed an agreement acceptable to the Corporation with respect to the joint purchase and use of machinery, equipment or buildings which can be used profitably by them in their farming operations. Co-operative farm associations and certain farming corporations may qualify as syndicates for loans without the members entering into a formal agreement.

A syndicate may borrow up to 80% of the cost of machinery, buildings (including site and other improvements) and installed equipment suitable for joint use, to a maximum of \$15,000 per member or \$100,000, whichever is the lesser. Loans are repayable over a period not exceeding 15 years for buildings and installed equipment, and seven years for mobile machinery. The interest rate is based on the cost to the Corporation of funds advanced by the Minister of Finance, and its expenses in servicing loans. There is an initial charge of 1% on the amount of each loan. Security is provided by a promissory note signed by each syndicate member, and such other security as may be required. Up to March 31, 1972, the Corporation had approved loans for 730 syndicates totalling \$11.2 million. During the 1971-72 fiscal year the Corporation approved 134 loans for \$1.9 million.

The Small Farm Development Program, initiated by the Canada Department of Agriculture in 1971 with the establishment of a \$150 million fund to cover the first seven years of operation, is available to the provinces by agreement. It offers extended credit facilities to operators of small farms for the purchase of additional land or equipment to enable them to remain on the land and develop a profitable business; at the same time, the program benefits owners of small farms who choose to give up farming by allowing an adjustment grant in addition to the selling price of their land. Management and counselling services are also available.

The Land Transfer Plan of the Small Farm Development Program is administered by the Farm Credit Corporation acting as agent for the Canada Department of Agriculture. Under this Plan, special credit is made available for the purchase of land under agreement for sale. Unless the federal-provincial agreement specifies otherwise, the maximum permissible sale price is \$20,000, with a down payment as low as \$200 and a repayment period of not more than 26 years. The purchaser must be a Canadian citizen or landed immigrant who is the owner of a farm or has been a tenant for at least three years and whose principal occupation is the operation of that farm. He must have less than \$60,000 of assets and must buy from a vendor who is eligible for the assistance grant under the plan.

To be eligible for the grant, consisting of \$1,500 plus 10% of the sale price of the farm up to \$20,000 and not exceeding a maximum of \$3,500, a vendor must at the date of commencement

of the program be the owner of a small farm and be principally occupied in the operation of that farm. He must be able to support himself and his family at least as well after the sale as before, and he must sell all or substantially all of his land to a Canadian citizen or landed immigrant who will not operate the property as a separate uneconomic farm. The vendor is not eligible for a grant if the property sale price exceeds \$20,000 or such other maximum as may be established in the agreement with a particular province. Grants may be in cash or in the form of an annuity.

The Corporation maintains a listing service in its field offices to help bring sellers and buyers together. In special circumstances where no other purchaser is immediately available, the Corporation may purchase farm land for future resale at a price not exceeding 90% of the Corporation's estimate of its market value within the limits prescribed for the province where the property is situated. The seller will be eligible for a grant of \$1,500 plus 10% of the Corporation's estimate of the market value to a maximum of \$3,500.

The National Farm Products Marketing Council was established by the Farm Products Marketing Agencies Act to advise the Minister of Agriculture on all matters pertaining to the establishment of marketing agencies. It reviews their operations and assists them in promoting more effective marketing of farm products, and co-ordinates related activities of the provincial governments as well as the efforts of producers to establish marketing plans.

The Farm Improvement Loans Act (RSC 1970, c.F-3), administered by the Department of Finance, is designed to facilitate the availability of credit by way of loans made by the chartered banks and other lenders designated by the Minister of Finance to assist in almost every conceivable purchase or project for the improvement or development of a farm and includes the purchase of agricultural implements, the purchase of livestock, the purchase and installation of agricultural equipment or a farm electrical system, the erection or construction of fencing or works for drainage on a farm, and the construction, repair or alteration of farm buildings including the family dwelling, and the purchase of additional land for the purpose of farming. Credit is provided on security related to the purchase or project and on terms suited to the individual borrower.

The legislation, originally operative for three years (1945-48), has been continued by way of extensions, usually for three-year periods. The current extension is for the period July 1, 1971 to June 30, 1974. The maximum repayment period for land purchase is 15 years and for all other purposes ten years. The interest rate is prescribed in the regulations and is adjustable semi-annually on April 1 and October 1 of each year to reflect changes in the levels of interest rates generally. The borrower is required to provide from 10% to 25% of the cost of his purchase or project, depending on the loan category to which it belongs. The federal government guarantees each lender against loss sustained and an amount of up to 90% of the first \$125,000 lent, up to 50% of loans in excess of \$125,000 but not exceeding \$250,000, and up to 10% of loans in excess of \$250,000 made by that lender during a lending period. This guarantee does not apply to any loan made after the aggregate of all loans made by all banks in a given period reaches an amount fixed by statute. The current maximum stands at \$900 million which may be lent by the chartered banks and a limit of \$300 million which may be lent by other designated lenders. From inception of the program to December 31, 1971, 1.6 million loans amounting to about \$2.6 million were made. During the same period, payments were made to the banks under the guarantee provision in respect of 4,721 claims amounting to \$4.5 million, representing a loss ratio of less than one fifth of 1%. The maximum loan or amount that may be outstanding to a borrower at any one time is \$25,000.

The Prairie Grain Advance Payments Act, which came into force on November 25, 1957 (RSC 1970, c.P-18) and was amended in 1958, 1968, 1969 and 1971, provides for interest-free advance payments to producers in western Canada for farm-stored threshed grain (wheat, oats and barley). The rate of advance payment per bushel for wheat, oats and barley is prescribed by regulation each year. The rate approximates two thirds of the initial payment on the grade of each grain which it is estimated will be delivered in the greatest volume by producers to country elevators during the crop year. The maximum total advance is governed by quota levels also prescribed by regulation and may not exceed \$6,000 for any individual producer for the crop year. The rate of repayment is the same as the rate of advance. Repayment is effected by deducting approximately two thirds of the initial payment for wheat, oats and barley delivered subsequent to the loan until the producer has discharged his advance.

The Act also contains provisions for special advance payments covering unharvested grain and the drying of grain. The maximum total advances receivable for these special advances are \$3,000 and \$600, respectively.

11.3 Provincial government services

11.3.1 Departments of agriculture

Newfoundland. Government agricultural services in Newfoundland are operated by the Department of Forestry and Agriculture. The Agriculture Division consists of six directors and a staff of 125 under an Assistant Deputy Minister of Agriculture. For administrative purposes, the province is divided into a number of districts with an agricultural representative located in each. Specialists in charge of different phases of agricultural development visit each district on assignment from the St. John's office.

Departmental policies in support of the agricultural industry include: a bonus of \$125 per acre on land cleared by privately owned equipment; distribution of ground limestone at a subsidized rate; payment of bonuses on purebred sires; financial assistance to agricultural societies, marketing organizations, and exhibition committees; and grants in aid of constructing vegetable storage facilities.

Favourable marketing conditions and departmental assistance and loans under the provincial Farm Development Loan Board, the Newfoundland Marketing Board and the Newfoundland Farm Products Corporation have contributed to increased output of agricultural products in the province.

Prince Edward Island. The Prince Edward Island Department of Agriculture and Forestry is composed of the following branches and divisions: the Economics, Planning and Marketing Branch; the Agricultural Services Branch, which consists of the Farm Management Division, the District Agricultural Extension Division, the 4-H Division and the Home Economics Division; the Production Services Branch, which consists of the Soils and Crops Division and the Veterinary and Livestock Division; and the Forestry Branch, which consists of the Forest Nursery Division and the Bunbury Nursery Division. The latter is described in more detail in Chapter 10.

Nova Scotia. The Nova Scotia Department of Agriculture and Marketing directs the government's agricultural program by implementing provincial agricultural policies. The Department is administered by a Minister, Deputy Minister and branch directors concerned primarily with extension and economics, horticulture and biology, livestock services, market development, soils and crops, and formal agricultural education through the Nova Scotia Agricultural College located in Truro. The Department is particularly interested in encouraging rural people to help themselves through strengthening their interest in such organizations as the Nova Scotia Federation of Agriculture, the Nova Scotia Fruit Growers' Association and other commodity-oriented groups.

New Brunswick. Provincial government agricultural policy and programs in New Brunswick are administered and directed by the Department of Agriculture and Rural Development. Under the Minister of Agriculture and Rural Development, the Department is administered by a Deputy Minister, an Assistant Deputy Minister and the directors of branches concerned with: extension, livestock and dairying, veterinary services, poultry, plant industry, agricultural engineering, home economics, credit unions and co-operatives, and rural development. The Department also has a Farm Economics Division and an Information Division, as well as a Farm Adjustment Board, a Dairy Products Commission and a Forest Products Commission.

Quebec. The aim of the Quebec Department of Agriculture and Colonization is to promote agricultural development by making the best possible use of the province's resources through methods and techniques most appropriate to achieving its real and projected needs. Programs and regulations are constantly updated to meet changing situations and the modernization of agriculture is of particular concern.

The Department is headed by the Minister who is also responsible for the Quebec Sugar Refinery, the Farm Credit Bureau, the Agricultural Marketing Authority and the Crop Insurance Administration, each of which is operated by an autonomous board of directors. Under the general direction of the Minister, the Deputy Minister is responsible for

administration of the Department, for policy co-ordination and for the execution of programs established under these policies. Three Assistant Deputy Ministers are responsible for the principal Branches of the organization: Production; Research, Education and Administration; and Marketing.

The Production Branch is the largest in the Department; its major services and divisions are made directly available to the farmer. The Branch is responsible for veterinary services, animal husbandry, regional offices and laboratories, special projects, engineering and plant products. Veterinary services include work in the health of animals field, meat inspection and the provincial laboratories at Quebec and St-Hyacinthe as well as the veterinary medicines distribution centre at St-Hyacinthe; this service is also responsible for the sanitary inspection of meats in slaughterhouses and meat packing or processing plants operating under the "Quebec Approved" program. The animal husbandry section includes work in artificial insemination and animal diseases. The engineering section covers agricultural machinery, mechanized operations, farm buildings and agricultural water services. The plant production section covers field crops, horticulture, damage to uninsured crops, and the soils and plant husbandry laboratory. Agricultural extension and young farmers' programs are administered by the regional offices and laboratories of the Production Branch which are also charged with the operation of joint programs.

Through the Research, Education and Administration Branch, the Department carries out practical research directly applicable to agriculture at the farm level, pursues an agricultural education program, and provides for efficient administration of the budget.

Research and education cover crop protection, soils, apiculture and maple products, research stations and the La Pocatière and St-Hyacinthe institutes of agricultural technology. The Assistant Deputy Minister in charge of the Branch is the president of the Quebec Research Council, the co-ordination and promotion centre for most of the agricultural research carried out in Quebec. The Council directs research into specific fields to meet the special needs of Quebec agriculture. It maintains close liaison with federal government research organizations, and in drawing up its priorities also consults with the Quebec Plant Products Board and the Quebec Animal Production Board.

The administrative and financial services attached to this Branch include archives, land grants, travelling expenses, supplies, and grants and awards. The personnel section which makes up the rest of the Branch includes farm labour and civil defence.

The Marketing Branch, through the dual nature of its services and divisions, serves both agriculture and the consumer. The marketing aspect of the Branch includes economic studies (production, distribution, compilation and forecasts), marketing of agricultural products (publicity and search for markets) and technical assistance to the food industry (industrial development and business organization). Apart from its marketing role, the Branch includes those services and divisions responsible for control of dairy and meat products, supervision of warranties, prevention and elimination of fraud through quality control, and the chemical foods laboratory.

Ontario. The Ontario Ministry of Agriculture and Food conducts a wide variety of programs to develop a sound agricultural industry and to help farmers. Most assistance is through self-help programs which benefit the individual farmer. The Ministry administers 48 separate legislative Acts, some of which are regulatory, on an industry-wide basis. The Ministry has 54 county and district offices located throughout the province.
